THE PARTS MEN PLAY.

By ARTHUR BEVERLEY BAXTER, Author of *The Blower of Bubbles*, *Merric Gentlemen*, &c.

CHAPTER I.—LADY DURWENT DECIDES TO GIVE A DINNER.

I.

HIS Majesty's postmen were delivering mail. Through the gray grime of a November morning that left a taste of rust in the throat, the carriers of letters were bearing their cargo to all the corners of that world which is called London.

There were letters from hospitals asking for funds; there were appeals from sick people seeking admission to hospital. There were long, legal letters and little, scented letters lying wonderingly together in the postman's bag. There were notes from tailors to gentlemen begging to remind them; and there were answers from gentlemen to their tailors, in envelopes bearing the crests of Pall Mall clubs, hinting of temporary embarrassment, but mentioning certain prospects that would shortly enable them to . . .

Fat, bulging envelopes, returning manuscripts with editors' regrets, were on their way to poor devils of scribblers living in the altitude of unrecognised genius and a garret. There were cringing, fawning epistles, written with a smirk and sealed with a scowl; some there were couched in a refinement of cruelty that cut like a knife.

But, as unconcerned as tramps plying contraband between South America and Mexico, His Majesty's postmen were delivering His Majesty's mail, with never a thought of the play of human emotions lying behind the sealed lips of an envelope. If His Majesty's subjects insisted upon writing to one another, it was obvious that their letters, in some mysterious way become the property of His Majesty, had to be delivered.

Thus it happened, on a certain November morning in the year 1913, that six dinner invitations, enclosed in small, square envelopes with a noble crest on the back, and large, unwieldy writing on the front, were being carried through His Majesty's fog to six addresses in the West End of London.

Lady Durwent had decided to give a dinner.

An ordinary hostess merely writes a carelessly formal note stating that she hopes the recipient will be able to dine with her on a certain evening. The form of her invitations varies as little as the conversation at her table. But Lady Durwent

No. 471.—VOL. X.

was unusual. For years she had endeavoured to impress the fact on London, and by careful attention to detail had at last succeeded in gaining that reputation. She was that *rara avis* among the women of to-day—the hostess who knows her guests. She never asked any one to dine at her house without some definite purpose in mind—and, for that matter, her guests never dined with her except on the same terms.

Therefore it came about that Lady Durwent's dinners were among the pleasantest things in town, and, true to her character of the unusual, she always worded her invitations with a nice discrimination dictated by the exact motive that prompted the sending.

II.

H. Stackton Duncley looked up from his pillow as the manservant who valeted for the gentlemen of the Jermyn Street Chambers drew aside a gray curtain and displayed the gray blanket of the atmosphere outside.

'Good-morning, Watson,' said Mr Duncley in a voice which gave the impression that he had smoked too many cigars the previous evening—an impression considerably strengthened by the bilious appearance of his face.

'Good-morning, sir. Will you have the *Times* or the *Morning Post*? And here's a letter for you, sir.'

The recumbent gentleman took the letter and waved it philosophically at the valet. 'Leave me to my thoughts,' he said thickly, but with considerable dignity. 'I am not interested in the squeaky jarring of the world revolving on its rusty axis.'

Being an author, he almost invariably tried out his command of language in the morning, as a tenor essays two or three notes on rising, to make sure that his voice has not left him during his slumber.

Mr Watson bowed and withdrew. H. Stackton Duncley lit a cigarette, opened the letter, and read it.

'8 CHELMSFORD GARDENS.

'MY DEAR STACKY,—Next Friday I am giving a little dinner-party—just a few unusual

DECEMBER 6, 1919.

[All Rights Reserved.]

people—to meet an American author who has recently come to England. Do come; but, you brilliant man, don't be too caustic, will you?

'Isn't it dreadful the way gossip is connecting our names! Supposing Lord Durwent should hear about it!—Until Friday,

'SYBIL DURWENT.

'P.S.—How is *the* play coming on? Dinner will be at 8.30.'

H. Stackton Duncley put the letter down and sighed. He was an author who had been writing other men's ideas all his life, but without sufficient distinction to achieve either a success or a failure. He had gained some notoriety by his wife suing him for divorce; but when the Court granted her separation on the ground of desertion, it cleared him of the charge of infidelity—and of the chance of advertisement at the same moment. Later, by being a constant attendant on Lady Durwent, he almost succeeded in creating a scandal; but, to the great disappointment of them both, London flatly refused to believe anything wrong. For one thing, she was the daughter of a commoner—and the morality of the middle classes is a conviction solidly rooted in English society. And then there were his writings. How could one doubt the character of a man so dull?

Undiscouraged, they still maintained their perfectly innocent friendship, and, like kittens playing with a spool, invested it with all the appearances of an intrigue.

Dismissing his depressing thoughts, H. Stackton Duncley noticed that his cigarette was out, and closing his eyes, fell asleep once more.

III.

Madame Carlotti, clothed in a kimono of emphatic shade, sat by the fire in her rooms in Knightsbridge and read her mail while sipping coffee. She was the wife of an Italian diplomat, a sort of wandering plenipotentiary who did business in every part of the world but London, and with every Government but that of Britain. It was the signora's somewhat incomprehensible complaint that her husband's duties forced her to live in that fog-bound metropolis, and having thus achieved the pedestal of a martyr, she poured abuse on everything English from climate to customs. Possessed of a certain social dexterity and the ability to make the most ordinary conversation seem to concern a forbidden topic, Madame Carlotti was in great demand as a guest, and abused more English habits and attended more dinner-parties than any other woman in London.

From beneath seven tradesmen's letters she extracted one from Lady Durwent.

'8 CHELMSFORD GARDENS.

'DEAREST LUCIA,—I am counting on you for next Friday. A young American author

studying England—I suppose like that Count Something-or-other in *Pickwick Papers*—is coming to dinner. I understand he drinks very little, so I am relying on you to thaw him.

'Stackton Duncley *insists* upon coming, though I tell him that it is dangerous; and of course people are saying dreadful things, I know. He is *so* persistent. There will be just half-a-dozen *unusual* people there, my dear, so don't fail me. Dinner will be at 8.30.—So sincerely,

'SYBIL DURWENT.

'P.S.—Don't you think you could make Stackton interested in you? Your husband is away so much.'

Madame Carlotti smiled with her teeth and drank some very strong coffee.

'It ees deefficult,' she said, with that seductive formation of the lips used by her countrywomen when speaking English, 'for a magnet to attract putty. Still—there is the American. At least I shall not be altogether bored.'

IV.

That noon, in a restaurant of Chelsea, the district of Pensioners and Bohemians, two young gentlemen, considerably in need of renovation by both tailor and barber, met at a table and nodded gloomily. One was Johnston Smyth, an artist, who, finding himself possessed neither of a technique nor of the industry to acquire one, had evolved a super-futurist style that had made him famous in a night. He was spoken of as 'a new force'; it was prophesied that English Art would date from him. Unfortunately his friends neglected to buy his paintings, and as his art was a vivid one, consisting of vast quantities of colour splashed indiscriminately on the canvas, it took more than his available funds to purchase the accessories of his calling. He was tall, with expressive arms that were too long for his sleeves, and a nose that would have done credit to a field-marshal.

The other was Norton Pyford, the modernist composer, who had developed the study of discord to such a point that his very features seemed to lack proportion, and when he smiled his face presented a lop-sided appearance. He had given a recital which set every one who is any one in London talking. There was but one drawback—they talked so much that he could persuade no one to listen, and he carried his discords about with him, like a bad half-crown, unable to rid himself of them. He was short, with a retreating forehead and an overhanging wealth of black, thread-like hair, gamely covering the retreat as best it could.

'Hello, Smyth!' drawled the composer, who affected a manner of speech usually confined to footmen in the best families. 'Hah d' do!'

'Topping, Pyford. How's things.'

'Rotten.'

'Same here.'

'I say, you couldn't'—

'Just what I was going to ask you.'

The composer sighed; the artist echoed the sigh.

'Have you seen Shaw's show?'

'Awful, isn't it?'

'Putrid—but the English don't'—

'Ah! What a race!'

'Just so. I say, are you going to Lady Durwent's on Friday?'

'Yes, rather.'

'Look here, old fellow—don't dress, eh?'

'Right. Let's be natural—what? Just Bohemians.'

'The very thing. By-the-by, you don't know a laundry that gives'—

'No, I can't say I do.'

'Well, so long.'

'Good-bye.'

'See you Friday.'

'Right.'

V.

Mrs Le Roy Jennings looked up from her task of drafting the new Resolution to be presented to Parliament by the League of Equal Sex Rights and Complete Emancipation for Women, as a diminutive, half-starved servant brought in a letter on a tray.

Mrs Jennings took the missive, and frowning threateningly at the girl, who withdrew to the dark recesses of the servants' quarters, opened it by slitting its throat with a terrific paper-knife.

'8 CHELMSFORD GARDENS.

'DEAR MRS LE ROY JENNINGS,—An American author is coming to dinner next Friday. There will just be a few *unusual* people, and I have asked them for 8.30. I want him to meet one of England's intellectual women, and I *know* he will be interested to hear of your ideas on the New Home.

'My daughter joins with me in wishing you every success.—Until Friday, dear,

'SYBIL DURWENT.'

Mrs Jennings, who had made a complete failure of her own home, and consequently felt qualified to interfere with all others, scribbled a hasty note of acceptance in a handwriting so

forceful that on some words the pen slid off the paper completely.

Then, with a look of profundity, she resumed the Resolution.

VI.

And so, by the medium of His Majesty's mail, a little group of actors were warned for a performance at Lady Durwent's house, No. 8 Chelmsford Gardens.

Through the November fog the endless traffic of the streets was cautiously feeling its way along the diverging channels of the Metropolis—a snorting, sliding, impatient fleet of vehicles perpetually on their way, yet never seeming to get there. Taxi-cabs hugged the pavements, trying to penetrate the gloom with their meagre lights; omnibuses fretted and bullied their way, avoiding collision by inches, but struggling on and on as though their very existence depended on their reaching some place immediately or being interned for failure. Hansom-cabs, with ancient, glistening horses driven by ancient, glistening cabbies, felt for elbow-space in the throng of motor-vehicles. And on all sides the badinage of the streets, the eternal wordy conflict of London's mariners of traffic, rose in cheerful, insulting abundance.

On the pavements pedestrians jostled each other—men with hands in their pockets and arms tight to their sides, women with piqued noses and hurrying steps; while sulky lamps offered half-hearted resistance to the conquering fog that settled over palaces, parks, and motley streets until it hugged the very Thames itself in unholy glee.

And through the impenetrable mist of circumstance, the millions of souls that make up the great city pursued their millions of destinies, undeterred by biting cold and grisly fog. For it was a day in the life of England's capital; and every day there is a great human drama that must be played—a drama mingling tragedy and humour with no regard to values or proportion; a drama that does not end with death, but renews its plot with the breaking of every dawn; a drama knowing neither intermezzo nor respite: and the name of it is—LONDON.

(Continued on page 19.)

A CORNER OF TROPICAL QUEENSLAND.

ABOUT fifty years ago a prospecting-party was fitted out at one of the Australian ports to prospect New Guinea for gold, and left in a small sailing-vessel named the *Maria*. When the vessel reached the northern part of Hinchinbrook Island it met a cyclonic storm which wrecked it; but the men were afterwards able to take to the boats, and landed at different parts of the Queensland coast, near what is now

Innisfail. Some of the men were fortunate enough to reach civilisation, after many narrow escapes from the cannibal aborigines; others, unhappily, being unarmed, were captured by the savages and tied up to trees in the scrub or jungle close by, with scrub vines or canes. Evidently the cannibals sent round word to their next-door tribes, and, as is usual on such occasions, held a big 'corroborea.' These un-

fortunate white men were slaughtered and eaten, one at a time, as required, the best-conditioned going first, until they were all devoured. This was at a spot where the Main Dividing Range runs into the Pacific Ocean. Its precipitous slopes are clothed with thick tropical scrub, at the foot of Queensland's two highest mountains, named Bellenden Ker and Bartle Frere, which rear their heads into the clouds over 5000 feet above sea-level.

What does the traveller see round Innisfail today? Banana, pine-apple, and sugar plantations galore, with sugar-mills containing the most up-to-date machinery, and a white population of over 3000, producing thousands of tons of sugar yearly. Miles of scrub had to be felled and burnt off to effect this transformation. Many miles of railway of the regulation three feet six inches gauge have been constructed to carry sugar, fruit, and valuable timber to Innisfail and the pretty little circular ready-made port, Mourilyan Harbour. When vessels enter and leave this tropical haven, the passengers feel that they could almost touch either side of the rugged gateway with their walking-sticks. As they proceed north, hugging the mountain giants already mentioned where the deep blue sea-waves lap their feet, the scene is entrancing. The tropical vegetation is so dense that it is only here and there, where the water from the mountain-sides tumbles down into the sea, that bare rocks are to be seen. Ever-changing glimpses of green and golden foliage, as the sun's rays fall at different angles on this panorama, provide tropical pictures which must be seen to be properly appreciated.

As the steamer rounds a headland, one of the passengers asks the captain what is that group of buildings nestling at the water's edge to the left, and he is informed that it is the Marabah Mission Station, where the Church of England is trying to induce the aborigines and their families to become civilised members of the community, at the same time teaching them farming and certain trades. So far, the success has been remarkable with the young people, but not so with the old cannibals. Shortly afterwards the rising seaport of Cairns comes into sight, and very soon opens out along the sea-frontage into quite a large modern town of over 4000 people. Cairns possesses many fine buildings, such as hotels, banks, and commercial houses, with a large railway terminus which has its feelers running out in several directions, the longest one extending 260 miles towards the south-west. Cairns is built four feet above sea-level, on a flat pocket of land, the result of ages of drift swept down by the Mulgrave and Barron Rivers. On three sides it is enclosed by a high mountain-range; on the other side it faces the sea. Fifty years ago the site was tropical scrub, as at Innisfail.

The rise of Cairns can be partly attributed to a Scotsman, Mr William Jack, who had the hall-

mark of determination on his features as his capital, and who somehow worked his way into the hinterland with a mate, and discovered tin ore at a place now called Herberton. Scotsmen seem to have done most of the pioneering-work of this state. To make sure of the nature of the black substance he had discovered, Jack set fire to a large, dead, hardwood log lying on the ground near his tent, and placed lumps of the mineral in the fire. By persistent stoking he was rewarded, seeing it melt into tin. Now he was sure of his find, because only a few months earlier he had seen smelted tin at Stanthorpe, a tinfield on the southern border of Queensland. From now onward a rush of miners set in to the new find, the most convenient jumping-off spot for them being the place now called Cairns. Thus we see how this rich and prosperous part of the Empire got its first start.

Herberton, which is 2890 feet above sea-level, is connected by a railway with Cairns, eighty-two miles away. This railway has a history. It had to climb 1000 feet in nineteen miles in order to get on top of the first mountain-ledge, round the Barron Falls (700 feet high), as a gateway to the back-country. Railwaymen will understand what the surveying of this route meant along the precipitous mountain sides and gorges, where the engineer had often to be suspended by ropes to get his levels. This done, a pathway wide enough for men and mules to walk single file had to be made, and from this the width required for the permanent way had to be cut and blasted out of the rock for the iron horse. For five miles the line runs along the western bank of the Barron River, rising from 660 to 1065 feet. As one looks down to the river-bed from the snug railway-carriage, the scene is indescribable. One could almost toss an apple out of the window into the water nearly 1000 feet below. This undertaking holds the unenviable record for loss of life amongst the navvies who constructed it, so far as Australian railways are concerned. After pay-day, men disappeared of a night over this precipice, and became food for the eagle-hawks or the alligators. On one occasion a team of working oxen went bodily over and were smashed to bits; also mules more than once.

At the top of the Barron Falls is the pretty tourists' rest, named Kuranda, where there are several commodious and comfortable hotels. Many pathways radiate from this centre into the mountains and the scrub, where visitors may study nature in all its glory. When tired of this, they can move on by train fifty-one miles to Yungaburra, from where they may reach a magnified edition of the Kuranda scrub, with the addition of the two pretty lakes, Eacham and Boreen, as a reward for a few hours' walk or ride. Still farther on by train the extensive farm settlements around the progressive town of Atherton are to be seen; they well repay

a day's ramble, because each farm has been carved out of the scrub. Another twenty miles by train, still climbing up the Main Dividing Range, and Herberton is reached, and the traveller is in the tin country. It is wonderful how pure the air is up here, and how ready one is for meals. Although in the tropics, one needs plenty of bed-clothes at night-time.

The Cairns hinterland produces gold, silver,

tin, copper, molybdenite, wolfram, zinc, and lead. There are mountains of limestone, one of which contains the renowned Chillagoe Caves, which are not even yet fully explored. Although the writer spent hours in them, he did not see half of the rooms, but those viewed by the light of two acetylene-lamps were exquisite with their wonderful lace curtains. The colourings in shades of pale green, pale pink, and straw were a vision never to be forgotten.

THE MAN WHO CAPTURED THE KAISER.

By COULSON KERNAHAN.

PART I.

I.

SOMETHING was 'up' at Dover. I was on night-duty as a special constable, patrolling a country road near Roysbury, and, many miles away as Dover was, I could see lights shooting up, Roman-candle-wise. Some seemed for a moment suspended in the sky like the evening or the morning star; others floated lightly on the wind, as if child-angels had been at play, casting adrift in space lovely bubbles blown from diamonds, star-dust, and golden fire.

'Something up at Dover!' I said to myself; for, though I had many times since the outbreak of war seen searchlights and brilliant flarelights (the latter, perhaps, to signal the approach of hostile aircraft) shown from Dover, this was the first time to my knowledge that star-shells, or Very lights, or whatever they were, had been used. 'Perhaps this too,' I commented, 'is a signal of approaching aircraft; or its purpose may be to illumine the waters of the harbour, to assist those on the look-out for the periscope of a submarine. Confound that hedge there! It interferes badly with my view. I wonder whether I could see better if I got up on that gate; or, better still, if I shinned up that bit of an oak-tree beside the gate.'

Scarcely had I settled myself before I heard, first, steps approaching from the direction of the town, and then the swift whir and hum of a powerful motor-car, also coming from the direction of the town.

Soon the pedestrian, whoever he might be, was level with my gate, a little to the right of which was the tree in which I was perched. He was muffled in a short foreign-looking cloak, reaching only a little lower than the waist, and was wearing what looked like a Homburg hat; but though I could not see his face, something there was in his way of holding himself, or of wearing the cloak, that seemed strangely familiar. Either I had seen the man himself, cloaked as he then was, or else his portrait, in the shop windows or in the illustrated papers—and not

once, but many times. In no other way could I account for the strange familiarity of his appearance; but as, in my efforts to place him, I was perplexedly sorting in my mind the many portraits of celebrities with which one is familiar (very much as a card-player, having sorted out one court-card, shuffles through the pack in search of its companion court-card), the oncoming motor-car had drawn level with, and then stopped beside, the man in the cloak and the Homburg hat.

I say 'stopped,' but the suddenness of the stopping—highly dangerous, I should think—caused the car to lift itself upon the back-wheels, pawing the air, as it were, very much as a high-spirited horse rears upon his hindlegs at a sudden jab of the bit.

There is a doctor in Roysbury who, probably to impress upon the public—possible patients all—the enormous pressure upon, and the value of, his time, has acquired the art of executing a vault from his car so that he is out, and at the patient's door, if not actually inside the patient's house, before his chauffeur has brought the car up beside the kerb. I was reminded of this doctor by the acrobatic way in which the two occupants of the car leapt to earth the moment they were alongside the man in the cloak.

Almost before I knew what was happening, the first man to alight had thrown a heavy rug over the cloaked man's head and body; the second had stooped to pass a strap round the rug and the body of the prisoner, to pull tight the strap, and to secure it; while his companion knelt to whisk and make fast another strap round the prisoner's legs. Then, again almost before I knew what was happening, the stooping man seized the strapped legs of the prisoner, and hoisted them from the ground, while his accomplice threw both his arms round the captive's body, and with one 'heave-ho!' they swung their haul, helpless as the carcass of a dead bullock, into the car. Next, the first abductor sprang to the car's head to turn the

crank that sets the machinery going; while the second leapt back into the driver's seat, which, so quickly had their work been done, might well have been still warm from contact with his body. His companion was beside him at a bound, and the car, with captive and captors aboard, was off and away before I could even be sure about its build or 'make;' before I could be sure of anything concerning it, except that (whether purposely or accidentally turned off I did not know) there was no light showing at the car's back to illuminate the registered number plate.

II.

I came out of my tree and back to mother-earth by way of the gate—though I admit to dismounting, if only for my limbs' sake, more gingerly than the motorists—and climbed down, instead of emulating the busy doctor's vault. First I flashed my pocket electric torch backward and forward upon the road they had come, and the road by which they had gone, to see whether anything had been dropped in getting in or getting out. Nothing! Next I knelt to examine the spot where the car had for a few moments stood.

'Aha! the tires are apparently new,' I said, 'and criss-crossed at the edge, like the little leaded diamond-shaped panes one sees in old houses. I am not learned in cars, but I suppose that's to prevent skidding. There's no more by way of clue here. Now, I'll follow them as fast as I can, in case I chance to meet any one who may have noticed something about the car, and which way it went.'

The few persons I met, agricultural labourers or their wives from the villages round, had seen a car go by, but, as is common with folk of their class, had taken no particular notice of it, except that it was going very fast, and so they could tell me nothing. Then I came to a dead-stop. The next person I met, a curate on a bicycle, assured me that no car of any sort had passed him. As no car had gone by me meanwhile, it looked as if I had overshot the mark, and the car of which I was in search had turned up one of the two or three lanes which I had noticed on my way. Retracing my steps, I came to a lane, a mere muddy side-track, leading out of the high-road to the right. With the aid of my electric torch I satisfied myself that no car had passed that way. Otherwise some imprint of the tires would have been traceable on the mud. Then I came to a side-road leading to the left, and here I struck the trail, for where the car had perhaps lurched a bit in turning the corner sharply and hurriedly, the imprint of the diamond-shaped criss-crossing on the tire's edge was plainly to be seen.

I followed this lane some way, not stopping where the road was hilly and gravelly, but halting in the hollows when I came to a patch

of soft mud where the car's wheels might leave a mark, to make sure that I was not again out of my course, until I came to a carriage gate. The short drive beyond the gate was of hard, loose, not rolled, gravel, and so told no tales; but on the soft loam, just outside the gate, the print of a motor-car's wheels was visible. Clearly the vehicle of which I was in search had turned in here, for beyond this gate I could discover only such wheel-marks as would be made by a horse-drawn cart. Those left by a motor are broader, smoother, and, unless the ground be very soft, or the car extraordinarily heavy, much less deep. More important still, though the gate (which one of the two men had probably alighted to open, and had swung-to after him) was closed, the front-door, which faced the gate, was partly open. Possibly, in lifting out and carrying in their prisoner, the man who came last—his hands not being free—had been able to do no more than kick sideways at the door to close it, and either had forgotten to come back to see that it was shut or had been too busy securing the prisoner to do so.

But what best suited my purpose, and afforded me an ostensible excuse for calling at the house, was that from an upper window a brilliant and uncovered light was showing. Swinging open the gate, I walked boldly in, making no attempt to soften the scrunching of my feet upon the gravel, and loudly plied both bell and knocker. In reply a man came to the door, and pushing it more closely to, peeped through the remaining chink to inquire gruffly, 'Yes, who is it, and what do you want?'

'Good-evening,' I replied suavely. 'I'm a special constable, with instructions to report all offences against the Lighting Order. There is an uncovered light in the room upstairs. I must trouble you, please, to give me the name of this house and your own name, as it will be my duty to report you for a summons.'

'Easy does it, my friend,' he replied, opening the door wider, and now without any gruffness in his voice. 'I'm sure you splendid fellows—and you are doing your difficult duty capitally—are much too considerate to wish to summons a patriotic citizen for a trivial first offence. It has never happened before, and I don't know how the beastly thing has happened this time, except that I've been out. I did leave a light burning upstairs, I remember, but it wasn't dark then, and I did not expect to be out so long. I had forgotten all about the light since I came back. Let's take it that you've given me a warning, and that I promise it sha'n't occur again, and leave it at that. May I send you out a drink and a smoke?'

For answer I suddenly pushed past him and inside the house.

'I'm sorry,' I said; 'but you don't do your case any good by trying to bribe or buy one off by the offer of a smoke and a drink.'

Then—the light had been behind him thus far—I recognised him, and he me. As a matter of fact I had all along been tolerably sure of his identity, on account of his voice, but I thought it as well to make perfectly sure.

III.

One day, not long before the war, I had stopped to listen to a man who was preaching on Roysbury beach. Who or what he was—he may have been a spy, among other things, though that did not occur to me at the time—I did not know, but he was undoubtedly of Teutonic origin. The curious and unnatural grafting of an unctuous whine upon a typically German and guttural voice struck me disagreeably, and for some unexplained reason I took an instant and intense dislike to him. When, therefore, soon after my arrival, he was so foolish as to let temper and Teutonic insolence betray him into the natural man which underlay his assumed piety, I was more than a little amused and pleased.

He had been using the freedom and protection which England has too long afforded to undesirable aliens to denounce apparently every form of religion in this country except his own. What his own particular brand was he did not say; but, according to him, the Church of England was given over to Popery, and Roman Catholicism to idolatry. What was wrong with Nonconformity he did not make so clear, but one gathered that it was in an equally bad way; and we, as a people, were profligate, pleasure-seeking, irreligious, and peculiarly sinful.

'Mein vrienden,' he said, 'I want you to turn aside from your zinfül vays. I want you to turn ze back upon ze Devil. I want you to'—Then, turning savagely upon a man who happened at the moment to be poisoning a pocket-camera in his hand, as if for a snapshot, the preacher shouted, 'Vill you take your dam camera away! Ve don't want it here!'

'If you flatter yourself that I'm taking your portrait, Herr Preacher, you are very much mistaken,' replied he of the camera contemptuously. 'As a matter of fact, I'm taking a snapshot of the pier behind you, and what at this moment is troubling me is how to keep your—shall we say?—Bismarck type of beauty out of it. I don't want to spoil my picture.'

Some of those present were amused, some perhaps a little shocked—for your Englishman has a greater reverence for things sacred than he cares to parade—by the preacher's lapse from problematical piety to indubitable profanity. But the result of the retort, pit and pat and pertinent as it was, was to put a stop to the preaching, on that occasion at least, and the German had to come down from his pulpit—a fisherman's box—grinning with rage, and inwardly, if not outwardly, gnashing his teeth.

Seeing a smile on my face, the man with the

camera addressed a few words to me on the subject of aliens, and the freedom they are allowed in this country, with which I fully agreed, and so we came to know each other slightly, and to pass the time of day when we met.

This was the man who had opened the door to me at the house to which I had traced the abducting car. His name was Parkerly, and rumour had it that he was mad—so mad that his being at large without a keeper was a public scandal. Insanity so seldom, if ever, goes with a sense of humour—which Parkerly undoubtedly had—that I was minded to give the whispering and garrulous jade, Rumour, the cut direct, for the wanton and slanderer that she is. But though, except for a certain irrelevancy and absence of co-ordination in thought, and so in conversation, I found Parkerly a well-educated, widely travelled, and interesting man, and an unmistakable gentleman to boot, I came to the conclusion that on certain subjects he was not only a little, but stark mad. Of homicidal or dangerous mania, however, I saw no trace, and as I liked the man, he and I often chatted for a while when we met, though, until he opened the door for me on the occasion of which I am writing, I did not know where he lived.

IV.

'Why, it's Kenneth Dee, the book-writer, turned Bobby!' exclaimed Parkerly. 'How are you, Mr Dee!—be d—d to you for giving me a fright! Glad to see you, if only you had called at a less inconvenient time. I'm particularly engaged just now, talking over an important matter with a friend. Sorry if I offended you by proposing a drink and a smoke. I meant it merely as hospitality to a fellow-countryman who is a better and more duty-doing citizen than I. It wasn't for a moment meant as a bribe. About that light—you really mean that you are going to summons me, do you? Of course, if you insist, I must give you my name. You know that my surname is Parkerly, and the name of this house. But won't a warning do? I should hate the publicity of a police-court and the whole thing in the local papers.'

Inside the house as I now was, I did not intend to leave without doing my best to get to the bottom of what I was confident was an abduction; and I decided that, sane or insane, whichever Parkerly might be, my best plan would be suddenly to spring my charge against him, in the hope that, taken unawares and off his guard, he might say or do something to betray the motive for the abduction, as well as disclose the prisoner's identity.

'Very well, Mr Parkerly,' I said, 'we will take it that I have warned you about the exposed light, and that you undertake it shall not occur again.'

'Gladly,' he said with evident relief; 'and much obliged to you I am, as well as ashamed to have put you to this trouble.'

Then I looked him in the face and fired my broadside. 'But what about the abduction, by you and an accomplice, of a man in a Homburg hat and a cloak, and your bringing him here in your car?'

He was for the moment badly taken aback, that I could see, but recovered himself quickly. Then he dived his hand into his breast-pocket, took out his cigar-case, and without speaking, though I could see he was thinking intently, made as if to offer it to me.

I shook my head.

Selecting a cigar, he lit it leisurely, with a hand as steady as my own. 'Ho! ho!' he said. 'Hoo! hoo! So you know about that, do you? This complicates matters. I didn't want it to be known, for reasons with which you will be the first to agree when you hear them. Come into the smoking-room. I sha'n't keep you ten minutes. The matter is not serious, though it may look so, and as a "special" you are only doing your duty by inquiring into it.'

v.

When we were seated, he asked, 'Do you know my friend Warlingham?'

'No.'

'Ah, that's a pity. It's a sad story. He is eccentric, I admit, but sane, sir, as you or I. His people have got it into their heads that he is mad—dangerously mad—and ought to be put away. If there is any madness in the family, it is they, surely, not he, who are mad, or they wouldn't propose anything so monstrous. Anyhow, they have now talked round the family doctor and another medico to sign the necessary certificate, or the "petition," as it is called, of a "relative." Also, they have got a "beak," who is a family friend, to sign the judicial order. To-morrow they are going to clap the poor chap into an asylum. If they wanted to drive him mad, they couldn't take a more effective way. Why, I'm told that even doctors and attendants who have to do only with mad folk come to look strange and different from the rest of us, come to look mad, and come at last, some of them, to go mad. Insanity is not infectious, as, say, smallpox is, but it is what I call "affectious." I mean that constant association with the insane often affects the mind, just as constant association with leprosy—which I believe is not actually infectious in the accepted sense—ends in those so associated (Father Damien, for instance) becoming themselves afflicted with leprosy. It is a pity you don't know Warlingham. If you did, a novelist as you are, and with some knowledge of

human nature, you would agree that to clap such a man—highly nervous, abnormally imaginative, and introspective—into an asylum, under care of a keeper, and with madmen for his fellow-inmates and only associates, would so prey on his mind that he'd be out of it—which he isn't now—before three months are past.

'It mustn't be, sir. It is too horrible and inhuman to be thought of; and, as Warlingham's best friend, it was up to me to act. My plan was for him to clear out, to go where his people couldn't find him; but (I think his mind *is* getting a bit affected at last—affected, that is to say, to the extent of rendering him incapable of making up his mind) I could not get him to act. One minute he agreed with me, was ready to go anywhere, ready even to make a bolt for it, then and there, while he was safe. The next minute some objection presented itself, and he was as set on staying where he was, be the result what it might.

'Well, to-morrow, if they find him, they're taking him to an asylum, and as there was no more time to lose, something had to be done, and instantly. So I decided to kidnap him, *volens volens*, and keep him here, where he will be safe and out of the way. I have an old and trusted manservant, and to-night he and I tackled the job. Warlingham is fond of late country walks, so we followed him, pounced on him, hustled him into the car before he knew where he was, and brought him here, scarcely less than half-an-hour ago.

'Now that the thing is decided for him, now that he, poor chap, hasn't got to make up his own mind to take action, he sees that I have done the only wise and friendly thing by him. He is not only content and glad to stop here in safety, but is more than grateful to me for thus kidnapping him.

'I am sure that, as a humane man, Mr Dee, you will agree with what I have done, solely in a friend's interests, and that you will keep the rather painful secret, and leave things as they are—especially as I am more than willing that you should see Warlingham, and satisfy yourself that it is really his wish that the affair be kept quiet, and that he remain in safety here. Come, Mr Dee, could anything be fairer than that? What? Give me five minutes to explain the situation to Warlingham. It wouldn't be wise, upset as he is by the day's happenings, to spring an entire stranger upon him before he knows why.'

Parkerly's eyes were glittering unnaturally, but otherwise he was quite his natural self, and he did not omit, before leaving the room, to place biscuits, the spirit-decanter, and a cigar-box on the table for my benefit.

(Continued on page 25.)

RIGID AIRSHIPS.

I.

GERMANY can rightly claim to have long been the centre of ingenuity for producing mechanical weapons of war. That she failed to be the victor in the late international struggle was due to the misapplication, or the faulty handling, of these weapons by the human brains and hands which controlled them. In many cases a weapon possessed exclusively by Germany, which the Allies did not imitate or copy, and consequently use, in counter-warfare, has never been shown in its proper sphere of activity, and therefore has not proved its true value. The Zeppelin is a very good case in point, and in view of the feats lately accomplished by R 34—feats which foreshadow a great commercial future for the rigid airship—it should be of interest to look over the recent history of Zeppelins so as to verify the above statement, and to search for any evidence of their successful employment in warfare. Important deductions may then be drawn as to (1) whether Zeppelins would have been of any use to the Allies during the war, and (2) their future military value to the British Empire.

II.

At the commencement of the war Germany possessed a small number of airships of the rigid type, most of which were under the control of the military authorities. The German Navy had not interested itself in airships until some little while after their adoption by the army, and on 4th August 1914 there were only two complete naval airship crews. It is almost certain that at the beginning of the war Zeppelins were intended for scouting purposes only. They were armed with machine-guns to ward off attacks by hostile aeroplanes, but, as the latter were only in their early stages of development, there was not much danger to be feared from them. A number of bombs were carried, to be used if a suitable target presented itself, as would very probably be the case in military operations. The ships were either of Zeppelin (metal construction) or Schütte-Lanz (wooden) type, until at a later date the characteristics of each class were pooled and an improved type of ship, the L 30 class, was designed and built by the Zeppelin Company, subsequent ships embodying improvements on this design.

The first German activities took place over Belgium, notably Antwerp, and from this date the effectiveness of aerial bombardment was realised by the German command. It must be remembered that in the early days of the war there were not sufficient aeroplanes to spare for bombing purposes, and the present type of bombing-machine, specially built to carry big loads over long dis-

tances, was not in being, so that the Zeppelin was the only type of aircraft capable of this work.

Immediately following the rapid military advance through Belgium into northern France, Germany commenced active naval operations against British soil. These consisted of raids on the east coast, which, however, were rather hazardous, owing to the great superiority of the Allied navies, and, in addition, little was gained by them. The bombardment of Scarborough may have satisfied the minds of the German public; but the higher command wished to get a stranglehold on the centre of British war activities, to inflict serious damage on the rail and munition centres around London and other important districts. The work done in Belgium showed the possibility of using Zeppelins for such a purpose, and the scheme was taken up with the usual German thoroughness. It took a little time to make the necessary preparations. Sheds had to be erected as near England as possible, preferably in conquered Belgium; the meteorological service had to be reorganised, since the weather reports from the west were no longer obtainable; more airships had to be built and additional crews trained. The thoroughness with which the Germans took up their Zeppelin policy may be judged from the fact that sheds were built in the Balkans and in Russia. It was from the former that the famous effort to relieve the East African forces by delivering stores by air was organised.

An abortive raid, or, rather, a 'feeler,' was carried out late in 1914, and the raiding of England, and incidentally of central France, commenced in earnest on 19th January 1915.

There is no doubt that in their raiding policy the Germans really intended to damage railroad centres, war-factories, and other depots of importance; but the German command did not take into account the personal element—the effect that retaliation in the form of anti-aircraft fire would have on the Zeppelin commanders. The most daring pilot, a man who was eventually killed, caused more damage in one raid than the other five commanders that participated, by setting out to hit his target regardless of danger; but he was the exception to prove that, as a rule, airship captains on coming under fire simply threw out their bombs on the nearest habitation, and retired to a safer zone as quickly as possible.

The spring and early summer of 1916 witnessed a distinct pause in the raids. This was mainly due to the employment of the Zeppelins in their more legitimate work of naval scouting. Considerable attention was also being paid to the manufacture of a new type of ship, with which it was hoped to obtain better results.

III.

The absence of Zeppelins at the commencement of the Dogger Bank (24th January 1915) and Jutland (30th May 1916) actions may have been due to unfavourable weather conditions. This is improbable, as they put in an appearance towards the end of each battle, and it points rather to lack of co-operation between the marine and the air squadrons. It was known that naval airships had been used to a limited extent in co-operation with the navy afloat since the early days of the war, but the call for raids must have cramped development in that particular line. The L30 class, already referred to as a combination of the best points of all previous types of rigid airships, commenced to take the air in May, and they were allotted mainly for naval use. The Battle of Jutland showed the German naval staff that their warships were unable to stand up to the British Fleet in open action. Their only hope, therefore, of gaining naval supremacy was to employ an arm of naval warfare which the British forces lacked or could not compete with. The weapon was at hand in the form of aerial scouts. Germany possessed quite a large fleet of Zeppelins, whereas the British had only a handful of aeroplanes, not capable of extended flights. It was thus possible for the Germans to keep the British Fleet under complete observation, whilst they had a comparatively open field of undetected movement. This enabled a very clever trap to be set, and on 19th August 1916 perhaps the most interesting naval operations of the war commenced.

The German Fleet put to sea, acting as a bait to bring the British forces out. Zeppelins were detailed to watch the east coast, especially the large naval centres, and to report all inward and outward movements of warships. Other Zeppelins shadowed the British Battle Fleet in its movements in the North Sea. The trap consisted of a large number of submarines which were acquainted with the position of the British Fleet by wireless from the Zeppelins. It was intended to draw our fleet into a suitable position for submarine attack, which would sink or severely damage several capital ships, and throw the fleet into disorder. The German forces would then stand a very good chance of gaining a naval victory. The aircraft carried out their duties perfectly, but the scheme failed at the development of the submarine attack. These craft, attacking the advanced forces of the British Fleet, only sank two light cruisers and gave the main fleet warning of the trap, so that the German Fleet returned to port without moving into action.

This was the last operation carried out by the German Fleet on a large scale, and the naval airships were once more confined to anti-submarine patrols in Heligoland Bight and longer-distance

flights to report on the approach of enemy surface craft. The majority of the Zeppelins were, therefore, released to continue raiding England. However, during the summer the anti-aircraft defences of this country had been strengthened by the adoption of night-flying aeroplanes as a means of counter-offensive, so that shortly after the raids recommenced several Zeppelins were shot down over English soil.

IV.

From this date Zeppelin raids began to diminish in importance and interest. The British had, so to speak, got their measure. This particular form of warfare had inevitably to take the same course as any other—for instance, the submarine war. It lapsed into a struggle between technical departments, one side improving its methods of defence, the other side replying by improving the design of the attacking machines. Any advantage gained by the new design would shortly be nullified by fresh counter-resources. For example, the early raids were conducted from 6000 feet or less. Increase of anti-aircraft gun defence necessitated the building of the L30 class, which carried their bomb-load to 10,000 feet. Raiding-ships in 1918 flew at nearly 20,000 feet when over England, to avoid night-flying aeroplanes. The German command, nevertheless, had no intention of giving up their raiding policy. The loss of airships was inevitable, but it was considered that the damage they were reported to effect was more than sufficient compensation. Throughout the first half of 1917 the raids were half-hearted, owing to the losses in the latter part of 1916. Later in the year, however, a new type of airship was constructed, and extensive raids were recommenced, as many as eight or eleven ships participating in them.

In September the raiding of the south-east part of England was definitely taken over by heavier-than-air machines.

Airship raids, now confined to the Midland areas of England, continued at odd intervals. The Germans had several set-backs, and in October 1917 experienced a real disaster, when five ships out of a raiding squadron of ten were lost. Occasionally, as in April 1918, when Birmingham and several Lancashire towns were bombed, it would appear that the airship commanders had regained their old spirit. However, a further loss in August 1918, combined with the general effect that the war was having on Germany, brought an end to the raids two or three months before the Armistice was signed. The Allied Armistice Commission, who visited German airship-stations, reported that a large airship fleet was still in being, and that no expense could have been spared in providing airships, air-stations, and their equipment during the war, which is further evidence of the faith that Germany placed in her airship policy.

V.

As we glance over this short history, it is possible to follow the train of thought of those responsible for the German airship policy. At the outbreak of hostilities the majority of airships were under military control, and intended for scouting purposes. It was quickly realised by those in command that such an important and vulnerable object would not be allowed to fly unmolested over enemy military territory for any length of time. The night bombing policy resulted. In the abstract it showed great promise. A Zeppelin of the class existing in 1915 could carry over a ton of bombs from its base in Belgium or north Germany to London, and return. Accurate bomb-dropping was possible from airships, and in Britain means of defence were almost entirely lacking. It is difficult to place the blame for the failure of these raids. Primarily, the command should have realised that the enemy would quickly find sufficient means of defence, and that raiding in the first military sense—that is, to inflict damage of military importance—could be carried out only for a certain period. The motto during 1915 and early 1916 should have been, 'Strike while the iron is hot, and strike hard.' There were certainly a large number of raids; but the individual airship commanders failed to reach their objectives through lack of determination, or, rather, lack of attention to the prime objects of the raids.

Once the stage had been reached when effective bombing could obviously no longer be carried on, owing to the strength of the anti-aircraft defences, it was a matter of determining how the occasional losses, inevitable in harassing raids, would compare with the importance of the military hindrance to the enemy entailed in keeping adequate defence arrangements ready for instant use. It would appear that this was never recognised in Germany. Raids in full force were attempted throughout the war at an obvious loss to Germany, the results showing definitely that the Zeppelin, as a permanent weapon of war for air-raiding purposes over civilised country, is a failure.

The third use to which Zeppelins were put—naval scouting—needs most careful consideration. There is ample proof of their capabilities in this phase of warfare, a striking example being found in the naval operations of 19th August 1916. The weather conditions were very favourable for aircraft, and there is no doubt that the Zeppelins carried out their part of the programme perfectly. They were in no way to blame for the failure of the plan of action. This case being taken as an example, if only Germany had realised early in the war the great possibilities of using Zeppelins in the North Sea, the actions of the Dogger Bank and Jutland, with the consequent loss of ships to the German Fleet, could have been

avoided. Further, the liberties that the Allied fleets took in moving close in to the Heligoland Bight would have been vastly curtailed, as sufficient warning of the approach of surface craft could have been given to enable a superior force, or submarine or destroyer squadrons, to attack the enemy.

The two outstanding disadvantages of large airships are (1) difficulty in handling in and out of their sheds in high winds (that is, they are easily weather-bound), and (2) vulnerability.

Night bombing-raids could be carried out only in fine, clear weather, when the targets would be visible; so in connection with their main policy the German command had no need of devising methods to make their airships less dependent on weather conditions. The use of Zeppelins in connection with naval forces was not realised until too late, when the marine forces knew themselves to be outclassed, and thus no further efforts were made to bring the Zeppelins' performance in the face of weather more into line with that of surface warcraft.

As regards vulnerability in connection with sea-scouting, approximately four German airships were destroyed by naval forces, and five by heavier-than-air craft attached to naval forces. Numerous cases occurred of Zeppelins being sighted by our aircraft and escaping without damage. The only type of heavier-than-air craft that can destroy a Zeppelin under all circumstances is the fast fighting-plane. Larger machines, such as the Handley-Page and big flying-boats, can be avoided by the Zeppelin, unless caught at a distinct disadvantage. Whilst the large heavier-than-air craft have a considerable radius of action, the smaller types can operate from a parent ship, which gives them a greater sphere of activity. Naval supremacy, however passive, immediately curtails the scope of enemy heavier-than-air craft, and reduces the danger-zone for airships to a 150-mile limit extending from the enemy coastal defences.

Thus in the late war Allied rigid airships could have patrolled in the North Sea in almost complete security to the northward of a line joining Spurn Head and Jutland.

To revert to disadvantage (1), it was realised in this country that rigid airships, to be used with any degree of success, must be made as independent of the weather as possible. Once in the air, they are the safest type of aircraft existent, the difficulty, as already stated, being in handling them on the ground. In spite of the fact that we started some twelve years after Germany, we are already well ahead of her in this matter. It is only necessary to recall how R 34 was moored out for several days and refuelled in America, to see that great progress has already been made.

In view of these facts, it can confidently be stated that if a big rigid airship policy had been embarked upon in this country before the war,

the German Fleet would have been beaten at the very outset. Allied marine craft would have been relieved of a great deal of arduous and risky patrol-work in the North Sea, and Germany could never have attempted to raid the English coast or have put her fleet to sea as on 19th August 1916.

VI.

The gradual spread of what is commonly known as civilisation has always carried with it a fearful companion. As the world becomes more civilised, international understandings become more binding and greater alliances are made, with the obvious effect that wars are steadily increasing in magnitude. The sphere of full-scale active operations during the late war was confined to a single continent. It is highly probable that future warfare will be inter-continental, and that the necessary naval

operations will take place in an ocean, and not in a comparatively confined space like the North Sea. The importance of aerial warfare will have increased enormously, and it will be essential to hold supremacy in the air over any area, whether land or sea, before surface supremacy can be claimed. Distances over sea will be too great for the smaller fighting heavier-than-air craft, and any advance across an ocean by either combatant will have to be preceded by a superior force of lighter-than-air craft. Just as in the late war, when aircraft ranges were shorter, the Germans could claim, at such times as their Zeppelins were operating, to hold the North Sea, strategically, in the palm of their hands, so in future warfare the nation wishing to commence active sea offensive will have to gain the aerial supremacy, the weapon used being in the form of scouting-airships.

UNLUCKY.

By RICHARD THIRSK.

I.

'FRIDAY, the 13th of the month and the Old Man's birthday: it's unlucky.'

The mate of the barque *Remonstranter* was one of those sailor-men to whom the superstitions of the sea are immutable—as infallible guides to safety in his calling as is the compass to steer the ship from port to port. He accepted them without question as the unwritten decrees of the powers ruling the destiny of those who sail the seas, and in the course of long experience had so often proved their unflinching veracity that his belief had become a fetish. Hence, when 'the Old Man' called him into the cabin to inform him that the tug would be alongside to tow the *Remonstranter* from her anchorage on the morning of his birthday, a Friday, and, moreover, the 13th of the month, he forgot his usual 'Ay, ay, sir,' and went straightway below to consider.

Such a combination of evil omens was too much tempting of Providence, and his first impulse was to leave the ship. To sail in her meant disaster. Of that he was more certain than of to-morrow's dawn. Evil must of a surety befall those who seek it by disregarding all the rules of the sea: it was unlucky.

Yet to remain at Streaky Bay, a forlorn spot on the lonely Australian shore where vessels seldom cast anchor, might also be unlucky. At the best it meant exile for an unreckonable period, and the mate was a family man. But for this circumstance he would not have hesitated a moment in throwing down the gauntlet to 'the Old Man.' For the sake of his family he searched in his mind to find excuses which might enable him to salve his conscience, and take his chance of one day reaching home on board the *Remon-*

stranter. From contemplating all the horrors that might befall the ship and her crew, he arrived at the stage when, like the Chinaman, he began to think backwards, and to credit those powers which deal out retribution to men who condemn the traditions of the sea with something approaching human equity. After all, he was not to blame, and why should he be punished because the drunken captain took it into his head to sail on an unlucky day? If there was justice, then the curse must fall upon 'the Old Man's' head, and not upon the unoffending. Viewed in this light the load gradually lifted from his mind, though vestiges of fear remained, and it was with the tingling sensations of a man bracing himself to brave resolutions that the mate promised himself, or, rather, his family, to chance his luck and stick to the ship.

In case, however, the worst did happen, he could never forgive himself leaving this world without taking a last farewell of those waiting ones who might see him no more. Usually he pretended that wife and children were merely so many sources of trouble, and little else. Yet the prospect of never seeing them again revealed to him the depth of his affection for them. Therefore he took the precaution to go ashore next day with a letter addressed to his wife, which he instructed the agents to send by the first safe opportunity after the *Remonstranter* had sailed. All that he wrote to her was: 'Friday, the 13th of the month and the Old Man's birthday: it's unlucky.'

II.

In her youth the *Remonstranter* had been one of the smartest vessels running out to Australia. She fell upon evil days when steam began to

gain the mastery over sail, and was sold to Scandinavia, the emporium of old vessels. There she lost her smartness and her name, her whimsical new owner preferring the high-sounding *Remonstranter* to the plain English *Swift*. Now in her old age, in the pursuit of her career as a sailing tramp, she was back again under the Southern Cross, loading wheat for the northern hemisphere.

Streaky Bay had few attractions to compensate for its disadvantages. Owing to the nature of the shelving sandy shore, through which there was no fixed channel, the *Remonstranter* had perforce to lie at anchor about six miles out from the port. Consequently the cargo had to be brought off in shallow draught lighters, towed by a wheezy steam-tug which had its good days when it was very fussy, and its bad days when it refused to work. Loading was, therefore, a slow job, and long before it was finished the crew began to get out of hand. They justly complained that life was merely a monotonous round of work, food, sleep, and sun. To go ashore meant a twelve-mile pull there and back in a heavy dinghy, and there was nothing to do or to see when one got there. Besides, the master, who was drunk most of the time, fussed about giving the hands shore leave in case they might take it into their heads not to return.

The crew was composed of the usual cosmopolitan crowd of scalliwags found aboard decaying sailing-vessels. The only things they had in common were the sea and their work. Therefore there was no possibility of their finding amusements among themselves. On the contrary, when the sun got on their nerves they began to hate the sight of each other, and then there were elements of danger.

Now and then, when 'the Old Man' had been driving them too hard, they came together in self-defence and held a council of war for'ard. Ohlssen, the wildly romantic Swedish Bolshevik, a man born of tired parents, constituted himself spokesman on these occasions, and enlarged upon a scheme he had in his head for 'putting an end to this dog's life by deserting the ship.' He claimed to know every inch of the surrounding country, and assured his audience that at the back of the town was a land flowing with milk and honey, where a man could pick up lumps of gold. Exactly how far it was from Streaky Bay he did not say; but once there, he was going to live happy for evermore, safe from the sea and its monotony.

In his guileless days Ohlssen had trained for a sky-pilot, and he understood how to embellish his yarn about 'the promised land.' It amused the hands, and helped to pass away the idle evening hours before turning in. Home comforts, fresh milk, and gold galore conjured pleasant thoughts on which to sleep. Yet all the eloquence left them cold when the Bolshevik came to the practical point and invited them to join him

in his wild-geese chase. Only one convert fell into his net, a weedy fellow-countryman who owed 'the Old Man' a grudge.

Master and pupil became chummy and secretive, spending their spare time in low-toned confab. As this was in their native language, the hands were not supposed to understand, though they were sufficiently interested to conclude that behind the cloak of secrecy was a plan for getting to 'the promised land.' Yet neither the Bolshevik nor his recruit was taken seriously until one morning their bunks were found empty, and the bosun discovered that the big ship's boat in which the master went ashore daily was missing. At the same time the steward reported that his stores had been broached. A hasty search established the fact that the twin plotters had deserted.

Anxious eyes turned shoreward, and speculation was rife as to whether or not they might get clean away. The affair was discussed with as much zest as if such an incident as a desertion had hitherto been unknown. Over the pros and cons the ship's lawyers talked themselves into good humour, with the sole exception of the master. Unfortunately the crew did not have the satisfaction of hearing him express himself, yet his vicious look when he came on deck, and the fact that he went ashore before breakfast, warned them that he would not take the affair lying down.

For one good reason, he could not. The *Remonstranter* was already short-handed, and the prospect of finding substitutes for the deserters at Streaky Bay was so remote as to be out of the question. Yet find the deserters or substitutes he must, else the vessel could not sail. Consequently the first thing he did ashore was to seek the assistance of the local authorities in recovering the runaways.

As it happened, the authorities were too busy to trouble about truant sailor-men who, they predicted, must sooner or later return from the wilderness of their own accord. To the captain's astonishment, nobody seemed to care much what happened to them, and though the boat in which they had absconded was discovered without much trouble, two days elapsed before a search-party, fitted out with all the necessary equipment for a sojourn in the desert, could be organised.

Starting from the point at which the deserters had landed, the party had little difficulty in following their traces in the sand. Articles of clothing and odd tins of preserved food, dropped by the fugitives to expedite their flight, formed useful landmarks at places where the footprints had disappeared in sand-drifts.

As the searchers correctly surmised, the tins of food were systematically placed at intervals where they might easily be found again should circumstances compel the runaways to double back on their tracks. Therefore they were not surprised when, early on the second day out,

they found Ohlssen's companion exhausted on a sand-dune. His eyes stared out of his head with no gleam of intelligence in them, and his throat was so parched that he could no longer articulate words, merely uttering hoarse sounds.

It appeared that after plodding along for some time together, making slow progress in the loose sand, Ohlssen, fearing that the water-supply might give out, had relieved his companion of the commodity while he slept, and proceeded alone, leaving him to his fate. By this time Ohlssen had begun to doubt the existence of his 'promised land.'

Towards evening of the same day the searchers met him retracing his steps, looking little the worse for his outing. As he informed his rescuers, the farther he went the more his water-supply decreased, until it became so perilously low that all hope of reaching his goal fled from him, and he was wending his painful way back to civilisation on the dregs still remaining in his water-bottle.

III.

Early on the morning of Friday, the 13th of the month and 'the Old Man's' birthday, the unlucky day on which the *Remonstranter* was to sail, the foot-slogger, as the hands dubbed Ohlssen, was brought out on the tug under police escort. The authorities were determined to have no more trouble with him, and deemed it advisable to keep him safe under lock and key until the ship was on the point of leaving. This the Bolshevik resented, and he had caused trouble, in which he apparently got the worst of it, for he rejoined the ship sullen and morose, threatening to drown himself or to shoot some one before the end of the voyage. Nobody suspected for an instant—not until the vessel came into port and he proved it—that he had the courage to do either. Instead of taking him seriously, the hands chaffed him unmercifully about his 'promised land' escapade and for deserting his dupe, who was still suffering so much from the effects that the ship had to sail without him.

Aboard the tug which brought off the sand-slogger were several of the master's shore acquaintances, who had come to bid him good-bye, and incidentally to celebrate his birthday. Judging by the numerous empty bottles shot over the side, he did them so well that departure was delayed by several hours. When they staggered out of the cabin they were all exceedingly friendly and unsteady, and the skipper of the tug was so drunk that he had to be lowered over the side aboard his own craft.

All the while the wind was rising, blowing inshore, so that unless the *Remonstranter* were very carefully handled after her anchor was up, there was some danger of her being blown down among the shallows, in which case she would

remain for ever at Streaky Bay, as the tug was too light to take her off. On the advice of the mate, who for obvious reasons was obliged to take command, it was arranged that the tug would keep a strain on the hawser while the crew weighed anchor, then tow her out some distance until sufficient sail had been shaken out.

Everything went like clockwork until the *Remonstranter* began to gather way, and the mate, assured that he could clear himself, shouted to the skipper of the tug to let go the towing-rope. In order to do so the drunken skipper had to leave the wheel. This caused him to lose his balance, and he measured his length on the deck. Almost simultaneously the tug breasted a high wave, which slewed her round broadside on in the track of the *Remonstranter*.

'Hard over!' the mate yelled to the man at the wheel. Though the order was obeyed instantly, nothing could prevent the inevitable impact. Before she had time to answer her helm, the *Remonstranter* crashed into the tug amidships. The tug shivered from stem to stern, as though unable to decide whether to float or go down. Steam hissed out of her hatches and her engines stopped short.

The *Remonstranter* heeled over slightly as she slid her bow along the slippery side of the tug. Thanks to her heavy cargo, she soon righted herself and headed out to sea, towing the tug alongside stern first at the end of the towing-rope, which the skipper had been unable to let go. For the space of a minute or two the situation looked serious, and anything might have happened had not the mate rushed forward and cut the tow-line, permitting the *Remonstranter* to swing clear into her course. As though by a miracle, she escaped without serious damage.

Exactly how the tug fared no one on board the *Remonstranter* ever knew, for she was too anxiously examining her own damage to wait and make inquiries. When last seen the tug was drifting inshore, her convivial party swarming the deck, and her skipper shaking his fist in impotent rage at the receding *Remonstranter*. Doubtless he was hurling unheard invectives up the wind at his departing crony whom he had pledged in more glasses than were good for him.

'This comes of sailing on a Friday, the 13th of the month and the Old Man's birthday,' the mate said, as he paused to look around him and wipe the perspiration from his brow.

IV.

The mate certainly had good cause for his ingrained belief in the superstitions of the sea, and for the constant repetition of his unlucky refrain. The *Remonstranter* took the dirty weather with her, and was so badly buffeted

about in the Indian Ocean that her main fresh-water tank sprang a leak, which was not discovered until practically all the contents had been absorbed by the wheat cargo, which was in bulk. In consequence the crew had to be rationed half-a-pint daily. Had the misfortune been discovered earlier, they could easily have collected sufficient rain to tide them over. But evidently fate had decreed that luck should be against the ship, for the rain-squalls which had added to their miseries lifted before a gale, blowing the vessel out of the track of passing steamers.

Cape Town was the nearest port of call, and an attempt was made to reach it, to replenish supplies. After battling valiantly against headwinds, the master resolved to give it up as futile, and laid a course for St Helena, trusting to luck to take him thither before the water-supply gave out.

Meantime Andersen, the steward, fell ill, so that the hands were obliged to make shift for themselves in the galley. Nearly all of them suffered from the effects of the reduced water-supply, and had no energy left in them. For the most part they elected to exist on cold tuck, on the plea that they did not want to waste water.

In this they showed some wisdom, for the spare tanks were perilously low when the man at the wheel made a landfall—St Helena. This happened on a Sunday evening, and the local authorities sent out a message forbidding the *Remonstranter* to enter the harbour before the pilot came off to fetch her next morning. At sea necessity supersedes all law and all instructions. And surely a thirsty ship constituted a necessity. At any rate, this was the view 'the Old Man' took, for, without waiting to argue the point, he proceeded as though he had not heard the instruction.

Somebody or other came out and made a bit of a fuss when the *Remonstranter* dropped anchor in the harbour. But no one paid any heed, and that night the hands had all the fresh water they could drink. Some of the more cleanly disposed were not satisfied until they had bathed in it, feeling that the mere act of drinking was not sufficient to satisfy their long-standing thirst. Andersen, the steward, was one of the bathers, and he declared that he felt better almost at once.

St Helena has not many attractions for sailormen, yet the *Remonstranter* managed to spend a very happy week there while repairs were being done and stores taken on board. Contrary to his customary practice, 'the Old Man' insisted on all the hands spending as much time as possible ashore, and, in order that they might enjoy themselves, he was extraordinarily prodigal in the matter of cash advances. This unwonted spasm of generosity made such an impression on the hands that they soon began to fear the

reaction, and expressed genuine regret on leaving the island.

However, all went well until they got on to the Line, where the heat was unusually intense. This caused the damp wheat in the hold to germinate, and the stench became daily more pungent, until it seemed to go through and through one's system. What was, if anything, even worse, myriads of weevils thrived on the putrefying mass—little black fellows about the size of peas, and as hard as the dried variety served in ship's soup. They swarmed up through the hatches until the burning deck was literally one black mass; they got into the stores so that the food was crawling with them, and at every mouthful one had perforce to swallow what became known as weevil fare; they infested the bunks, making it impossible to escape them, asleep or awake; and they stuck fast in clothing and hair, making life a burden and a misery. The only good thing that could be said for them was that they did not bite, otherwise nothing else could have existed aboard the ship. But their crawl itched and irritated the skin, which was almost as distracting as a bite, driving one to the verge of distraction.

In some respects 'the Old Man' fared worse than any one, because of his proudly trimmed, thick, bushy beard. The weevils made this their happy hunting-ground, so that he had to spend much of his time in the vain attempt to pick them out. In the process he lost his temper, and in a moment of desperation resolved to shed his glory. Thus it happened that one Saturday evening, when the slop-chest was opened—a weekly event on board—and the hands collected to draw their requirements, they failed to recognise their chief. At first glance it seemed as though some mysterious stranger had taken his place, and the illusion was not dispelled until he spoke. Even then some of the younger hands found it difficult to believe that the president at the slop-chest was their own 'Old Man' rejuvenated. The transformation made him look for all the world like a music-hall comedian, which appealed to the risible faculties of the men. At this stage 'the Old Man' became painfully self-conscious. He closed the chest with a loud bang which left no doubt as to his identity, and cleared them out of the cabin for a lot of fools who did not deserve either shirts or tobacco.

These unwelcome passengers continued to irritate and annoy all the way up to Falmouth, where the *Remonstranter* had to call for orders. An agent was waiting there with a telegram instructing her to proceed to her home port. As this meant a passage of anything from ten to thirty days, according to the wind—a serious matter considering the state of the cargo—'the Old Man' asked his owners by wire to arrange for immediate discharge in the United Kingdom. Word came back that he was to proceed as

ordered, and not waste time in telegraphing. So away he sailed, weevils and all, making the passage in fourteen days.

v.

Almost before the *Remonstranter* had time to drop anchor in the roadstead numerous small craft put off to welcome her. Among these were the usual 'pimps' who infest ports, lying in wait for sailor-men to relieve them of their hard-earned money before they have had time to feel its value. Among these was a laundry-wench, whose errand was ostensibly to solicit washing, but who added to her income by touting for a water-side public-house of questionable repute. In order to prove the excellent quality of the fare kept there, she had cunningly secreted several bottles of fiery spirit about her person. These she cautiously distributed among the hands the moment the mate turned his back.

No sooner were the sails unbent than the fore-castle settled down to a hilarious home-coming. Quantities of liquor were forthcoming—sailors have a way of always getting what they want in that line—and the orgy was kept up all through the night. Some of them had indulged so generously that by the time the *Remonstranter* was berthed next morning the hour of repentance had struck. They were bleary-eyed, big-headed, and quarrelsome. Singing had given way to doleful complaints, and rejoicing to fighting. That buxom laundry tout caused more trouble on board than had all the storm-buffeting, the ravings of thirst, or the weevils. Men who had stuck together through foul weather and fair, had braved the dangers of the deep, bringing their ship safe to port, rounded upon one another, usually without any apparent cause.

Ohlssen, the sand-slogger, was at that stage when he would willingly have fought with his shadow. Failing that, he singled out Andersen, the steward, an inoffensive little fellow, who often spoke of a wife and children anxiously waiting for him. Andersen had been more moderate than most in his rejoicings, which Ohlssen declared was 'swank.' As a preliminary to taking the pride out of him, he called the steward by some of those choice epithets of which nautical phraseology is prodigal; then, to show his contempt for him as a cook, he threw a mug of boiling coffee, which caught Andersen fair on the forehead.

Scalded and dazed, Andersen locked himself in his cabin, and refused to come out, or to cook any more food. Nothing further was thought of the incident until dinner-time approached. As no preparations for the meal were evident, an attempt was made to force Andersen out of his cabin. But he had evidently anticipated a raid, and barricaded the door so well that it resisted all attempts to open it. This made Ohlssen furious, and he swore he would kill the steward as soon as he set eyes on him,

punctuating each word of the threat by hammering with his fist on the cabin door.

It must be admitted in Ohlssen's defence that he was hopelessly drunk. At the best he was a low-type bully. Like all bullies, he carefully selected his victims from among those whom he felt to be physically weaker than himself, and once he had established an ascendancy over them, he did his best to make their life a misery. This was not the first time he had fallen foul of Andersen during the voyage, though he had not hitherto been openly set at defiance before his mates. For the sake of his reputation, he had to make the steward pay for it, as he said. 'Wait, boys,' he shouted, pushing them aside as he rushed below, to return a few minutes later flourishing a revolver, and exclaiming, 'I'll do him in. You watch if I don't do the blighter in.'

On the way to Andersen's cabin he picked up a marlinespike, with which he had little difficulty in prising open the door. Andersen sat huddled in a corner, staring silently at the intruder with the revolver in his hand.

'So you won't cook the dinner for us, won't you?' Ohlssen hissed rather than spoke. Before Andersen had time to answer, he continued, in the same tone of voice, 'Well, then, I've brought some dinner for you. There, take it!'

He fired at point-blank range, and his victim slowly collapsed, as though life ebbed out of him by degrees. By the time the harbour police arrived, in response to the master's summons, the steward had passed beyond the tormentor's troubling, out on the last voyage where there is no more sorrow.

A week later, when the preliminary police investigation had been completed and the murderer sat in jail awaiting trial, Andersen was quietly laid to rest in the little churchyard overlooking the bay. The mate, who had acted as chief mourner, lingered beside the fresh grave after the others had gone. To him the tragedy that closed the eventful voyage was merely a further confirmation of his unshaking belief in the superstitions of the sea. As he turned away he rubbed the corner of his eye with the second joint of his little finger, muttering half-aloud, 'Poor fellow, he's paid the penalty. This comes of sailing on a Friday, the 13th of the month and the Old Man's birthday: it was unlucky!'

LOVE'S PAGEANT.

I CANNOT pluck the wonder of the West
From out the burning skies of Eve, nor steal
From Dawn the rose-track of her joyous feet;
But all the glory of a love confessed
Shines on me from your tender eyes,
And in my hold is treasure, all complete—
'Gainst mine the beatings of your heart reveal
The joy and wonder of a world—my own!

I need no pageant skies
When all Love's splendour thus is round me thrown!
MAUD STOWARD.

Chambers's Journal

SEVENTH SERIES

IN CHILDHOOD'S DAYS.

By LADY SKERRINGTON.

IT is to be feared that few children at the present day could say, as George Washington is reported to have said, 'Father, I cannot tell a lie.' Most children lie glibly. And yet I wish most emphatically to affirm that, as a general rule, they lie without any consciousness of guilt. Until a child is old enough to understand *why* one thing is right and another thing is wrong, its only guide in life is fear—fear of punishment, or fear of grieving some one it loves, if certain arbitrary rules are disobeyed. If it can evade discovery, all will be well; if not, a quick-witted child will instinctively think of the most suitable excuse wherewith to avert disaster. Sometimes the excuses are both clever and amusing. Here are two.

Two little boys, whose mother held very strict Sabbatarian views, were cheerfully engaged one Sunday morning playing at horses round the nursery, when the door opened, and they saw their mother looking in upon them with a very disapproving expression. Before she had time to say one word, however, the elder boy, who was aged about seven, called out, 'Oh, it's all right, mother; we are just driving to church.'

On another occasion, a small boy, whose Sunday amusements were severely restricted, was found by his father making a paper boat on a Sunday. Without a moment's hesitation, the child looked round and explained, 'You need not mind, father, for prayers are going on in the cabin.'

Of course, in both these cases, although at the time the statements were looked upon as very clever and ready falsehoods, there is the possibility that the children had *really* been pretending they were doing what they described. The greater part of a child's life is spent in pretending. Children are giants, they are fairies, they are wild beasts, just as their fancy leads them; and they pretend with such zeal that it is often difficult for them to be certain where the real ends and the imaginary begins. Thus, they are often scolded for telling falsehoods when they describe the wonderful adventures they have had, and the strange things they have seen, though in all probability their lively imaginations have presented the scenes to them so vividly

that they *seem* real. Moreover, children are, apparently, more sensitive to psychic influences than older people. In the East this is so well understood that natives will, if they can, get hold of a small child, and persuade it to look in a saucer of ink—their substitute for a crystal—and then tell it to say what it sees there. It is quite possible that, while they are young, children may possess that gift which is called 'second sight,' though it may be crowded out by other things as they grow older. Here is an instance of what I mean.

A little girl of five had been made a great pet of by a friend of her mother's, and used from time to time to be asked to go with her nurse and pay visits at this lady's house. One morning, when the child had been having a sleep, and her nurse went to her, she called out at once, 'Mrs D—— has been to see me. She stood by my cot, and then she stooped down and kissed me.'

The nurse, who was a very grim person, severely reproved the child for saying what was not true. She explained that it was impossible for Mrs D—— to have been there, as she was living a long way off. The child, however, persisted in her story, and consequently was in dire disgrace. A few days afterwards news came that Mrs D—— had died suddenly, and almost exactly at the moment when the little girl said she had seen her; so that, if the child was romancing, the coincidence was remarkable.

This is merely one instance, but such cases are not uncommon. Children ought not to be too severely dealt with when they make statements of this kind, however improbable the statements may seem.

We do not often have to complain of too much logic in older people, but it is curious to notice that young children will frequently show a keen power of deduction, which is sometimes a little embarrassing to their parents and instructors. Here is an example.

A little girl had been hearing from her mother certain stories from the Old Testament, amongst others, about Abraham and Lot: how, when Abraham gave Lot the choice which part of the

land he would inhabit, Lot chose to go to the rich and wicked cities of the plain. It was pointed out to the child that he ought not to have made this choice. The little girl remained thoughtful for a few moments; then she inquired, 'But what would Abraham have done if Lot had chosen to go the other way?'

That was a problem which her mother had not considered, and she never explained how she escaped from the dilemma.

When a child is told to do something, or to leave something undone, it is just as well to be quite clear about the reason for the order, or troublesome conundrums may be presented unexpectedly for solution, as a friend of mine found to his cost. His small son had had a fine toy menagerie given him just as he was going to bed on a Saturday night. Naturally the child's first thought when he was dressed in the morning was to ask for his new toy; but he was promptly told that a menagerie was not a *Sunday* toy. After a few minutes' cogitation, the child looked up and asked, 'But I may play with my Noah's Ark on Sunday, so why is it wrong to play with a menagerie?' A rather difficult question to answer on the spur of the moment!

The following is another curious case of deductive reasoning. A little girl, who was only four years old, used to watch with great interest the goings out and comings in of the baby who lived next door. When, one day, the little girl's mother heard that the baby had died very suddenly the night before, she was greatly concerned on her own child's account, as she feared the news would be a severe shock. Accordingly she called the child to her, and explained as gently as possible that the baby had fallen very ill in the night, and that she would never see it being carried in and out of the house any more, as God had taken it away to be in heaven. She expected a flood of tears, but instead the child looked at her quite cheerfully, and remarked, 'That's a good job.'

The mother thought she could not have made her meaning clear. 'You don't understand, darling,' she said. 'The little boy has gone quite away to heaven.'

'Yes, I know,' the child replied. 'But you always tell me that it is much happier in heaven than it is here; and so I say it is a good job that the little boy has gone there.'

Undoubtedly the child was looking at the matter from the right point of view, yet the mother still felt her attitude to be rather heartless.

'Yes, dear,' she said; 'but it is not a good job for the little boy's mother. Think how sad I should be if you were taken away to heaven!'

'Oh, yes, you would cry one day, two days, and then you would be better; and by-and-by you would die and come to heaven too, and then we should both be there, which would be much better.'

The problems which vex a child's mind are by no means the same as those which disturb grown-up people, but they are none the less real; and though they are often very amusing, they ought to be listened to with due gravity. There are few things a child dreads more than ridicule, and it will certainly become reserved and shy if it notices that its inquiries are treated with levity. Probably many grown-up people, when ill, have been troubled by fear of death, or some other fear, but it is not likely that any of them have been perturbed in exactly the same way as a small boy I knew. He had been suffering from scarlet-fever, and he knew that nobody except his mother and the nurse was allowed to come near him for fear of infection. One morning, when his mother went in to see him, he looked up at her rather anxiously, and asked, 'Mother, if I die, will they let me into heaven, or will the angels be afraid of the infection?'

'Grown-ups' do not always realise how extraordinarily impressionable a young child's mind is, or how easily children become obsessed by the stories they hear. Many people have had their nerves damaged for life by being told tales of ghosts and other horrors when they were young and imaginative. Such stories should never be told to children; though, when once children have heard any of them, they find a horrible fascination in them, and will beg for more.

It is probable that many boys receive their first impulse to choose a sailor's life from reading wonderful tales of adventures at sea, such as Captain Marryat, Kingston, and others used to write. Even history plays its part. I knew three little Scottish boys who, after a course of Aytoun's *Lays of the Scottish Cavaliers*, supplemented by readings from *Tales of a Grandfather*, were asked what they intended to be when they grew up. The eldest boy immediately replied, 'Well, if there is likely to be a war with England soon, we are all going to be soldiers.'

At one period of their lives, however, they were not at all clear that it would not be best to be pirates, as pirates seemed to acquire everything they wanted without much trouble. So much for the morals of story-books!

A witty friend of mine, when she was consoled with for being obliged to witness the suffering of a friend she was helping to nurse, replied, 'Oh, I assure you it is an easy matter to bear another person's pain;' and grown-up people are apt to regard the joys and the sorrows of children in much the same spirit. With an easy philosophy,

they will remark, 'No doubt children feel pretty acutely at first; but then they forget so quickly.'

There they make a mistake. A child *never* forgets anything that has really made an impression upon it. Grief, disappointment, humiliation—all these score their marks deeply on a child's mind; while an act of injustice has been known to alter a child's character completely, for children have a keen appreciation of justice. Few people, if they cast their thoughts back into the past, will fail to recognise this. No doubt the griefs of childhood, though they leave an indelible mark, seem trivial enough to the older mind, but the pain they cause is none the less poignant on that account. A child's outlook on life is necessarily narrow. The departure of a much-loved nurse will cause such grief to a child that, a whole lifetime afterwards, it will be able to recall the scene, and to feel again the aching sense of loneliness and desolation that

then overwhelmed it. Let us, therefore, be unstinting in our loving sympathy when the children seek it.

We cannot turn and sail back up the stream of life. The current is always carrying us farther and farther from those sunny shallows where the water was clear and sparkling, and the ripples shone in the sunlight. We have, instead, to gaze down often into turbid waters, and to pass over troubled rapids, as the river bears us away towards the margin of that silent sea that awaits each one of us. But almost the only thing that can never be taken from us is our memory of the past; and if we treasure up the recollection of those good days, those glad days, when we were young and foolish, we shall be able to give the children the ready sympathy they need. And while playing with them, and pretending with the best of them, we may chance to forget for a time that the past is past, and never can return.

THE PARTS MEN PLAY.

CHAPTER II.—CONCERNING LADY DURWENT'S FAMILY.

I.

LADY DURWENT was rather a large woman, of middle age, with a high forehead unruffled by thought, and a clear skin unmarred by wrinkles. She had a cheerfulness that obtruded itself, like a creditor, at unpropitious moments; and her voice, though not displeasing, gave the impression that it might become volcanic at any moment. She also possessed a considerable theatrical instinct, with which she would frequently manœuvre to the centre of the stage, to find, as often as not, that she had neglected the trifling matter of learning any lines.

She was the daughter of an ironmonger in the north of England, whose father had been one of the last and most famous of a long line of smugglers. It was perhaps the inherited love of adventure that prompted the ironmonger, against his wife's violent protest, to invest the savings of a lifetime in an obscure Canadian silver-mine. To the surprise of every one (including its promoters), the mine produced high-grade ore in such abundance that the ironmonger became a man of means. Thereupon, at the instigation of his wife, they moved from their little town into the city of York, where he purchased a large, stuffily furnished house, sat on Boards, became a councillor, wore evening-dress for dinner, and died a death of absolute respectability.

Before the final event he had the satisfaction of seeing his only child Sybil married to Arthur, Lord Durwent. (The evening-clothes for dinner were a direct result.) Lord Durwent was a well-behaved young man of unimpeachable

character and family, and he was sincerely attracted by the agreeable expanse of lively femininity found in the fair Sybil. After a wedding that left her mother a triumphant wreck and appreciably hastened her father's demise, she was duly installed as the mistress of Roselawn, the Durwent family seat, and its tributary farms. The tenants gave her an address of welcome; her husband's mother gracefully retired to a villa in Sussex; the rector called and expressed gratification; the county families left their cards and inquired after her father, the ironmonger.

Unfortunately the new Lady Durwent had the temperament neither of a poet nor of a lady of the aristocracy. She failed to hear the tongues in trees, and her dramatic sense was not satisfied with the little stage of curtsying tenantry and of gentlefolk who abhorred the very thought of anything theatrical in life.

On the other hand, her husband was a man who was unhappy except on his estate. He thought along orthodox lines, and read with caution. He loved his lawns, his gardens, his horses, and his habits. He was a pillar of the church, and always read a portion of Scripture from the reading-desk on Sunday mornings. His wife he treated with simple courtesy as the woman who would give him an heir. If his mind had been a little more sensitive Lord Durwent would have realised that he was asking a hurricane to be satisfied with the task of a zephyr.

They had a son.

The tenants presented him with a silver bowl;

Lord Durwent presented them with a garden fête; and the parents presented the boy with the name of Malcolm.

Two years later there came a daughter.

The tenants gave her a silver plate; Lord Durwent gave them a garden fête; and he and his wife gave the girl the name of Elise.

Three years later a second son appeared.

There was a presentation, followed by a garden fête and a christening. The name was Richard.

In course of time the elder son grew to that mental stature when the English parent feels the time is ripe to send him away to school. The ironmonger's daughter had the idea that Malcolm, being *her* son, was hers to mould.

'My dear,' said Lord Durwent, exerting his authority almost for the first time, 'the boy is eight years of age, and no time must be lost in preparing him for Eton and inculcating into him those qualities which mark an English gentleman.'

'But,' cried his wife with theatrical unrestraint, 'isn't he a gentleman, anyway? Why send him to Eton? Why not wait until you see what he wants to be in the world?'

Lord Durwent's face bore a look of unperturbed calm. 'When he is old enough, he must go to Eton, my dear, and acquire the qualities which will enable him to take over Roselawn at my death'—

At this point Lady Durwent interrupted him with a tirade which, in common with a good many domestic unpleasanties, was born of much that was irrelevant, springing from sources not readily apparent. She abused the public-school system of England, and sneered at the county families which blessed the neighbourhood with their presence. She reviled Lord Durwent's habits, principally because they *were* habits, and thought it was high time some Durwent grew up who wasn't just a 'sticky, stuffy, starched, and bored porpoise—yes, PORPOISE!' (shaking her head as if to establish the metaphor against the whole of the English aristocracy). In short, it was the spirit of the Ironmonger castigating the Peerage, and at its conclusion Lady Durwent felt much abused, and quite pleased with her own rhetoric.

Lord Durwent glanced for courage at an ancestor who looked magnificently down at him over a ruff. He adjusted his own cravat and spoke in nicely modulated accents: 'Sybil, nothing can change me on this point. The making of an English gentleman cannot be left to chance. In spite of what you say, it is my intention to keep to the tradition of the Durwents, and that is that the occupant of Roselawn'—

'What! am not I his mother?' cried the good woman, her hysteria having much the same effect on Lord Durwent's smoothly developing mono-

logue as a heavy pail dropped by a stage-hand during Hamlet's soliloquy.

'Sybil,' said Lord Durwent sternly, 'it was arranged at Malcolm's birth that he should go to Eton. I shall take him next Tuesday to a preparatory school, and you must excuse me if I refuse to discuss the matter further.'

Lady Durwent rushed from the room and clasped her eldest child in her arms. That young gentleman, not knowing what had caused his mother's grief, sympathetically opened his throat and bellowed lustily, thereby shedding tears for positively the last time in his life.

When he returned for the holidays a few months later, he was an excellent example of that precocity, the English schoolboy, who cloaks a juvenile mind with the pose of sophistication, and by twelve years of age achieves a code of thought and conduct that usually lasts him for the rest of his life. In vain the mother strove for her place in the sun; the rule of the masculine at Roselawn became adamant.

Life in the Durwent *ménage* developed into a thing of laws and customs dictated by the youthful despot, aided and abetted by his father. The sacred rites of 'what isn't done' were established, and the mother gradually found herself in the position of an outsider—a privileged outsider, it is true, yet little more than the breeder of a thoroughbred, admitted to the paddock to watch his horse run by its new owner.

She vented her feelings in two or three tearful scenes, but she felt that they lacked spontaneity, and didn't really put her heart into them.

During these struggles for her place in a Society that was probably more completely masculine in domination than any in the world (with the possible exception of that of the Turk), Lady Durwent was only dimly aware that her daughter was developing a personality which presented a much greater problem than that of the easily grooved Malcolm.

The girl's hair was like burnished copper, and her cheeks were lit by two bits of scarlet that could be seen at a distance before her features were discernible. Her eyes were of a gray-blue that changed in shade with her swiftly varying moods. Her lower lip was full and red, the upper one firm and repressed with the dull crimson of a fading rose-petal. Her shapely arms and legs were restless, seemingly impatient to break into some quickly moving dance. She was extraordinarily alive. Vitality flashed from her with every gesture, and her mind, a thing of caprice and whim, knew no boundaries but those of imagination itself.

Puzzled and entirely unable to understand anything so instinctive, Lady Durwent engaged a governess who was personally recommended by Lady Chisworth, whose friend the Countess of Oxeter had told her that the three daughters of

the Duchess of Dulworth had all been entrusted to her care.

In spite of this almost unexampled set of references, the governess was completely unable to cope with Elise Durwent. She taught her (among other things) decorum and French. Her pupil was openly irreverent about the first; and when the governess, after the time-honoured method, produced an endless vista of exceptions to the rule in French grammar, the girl balked. She was willing to compromise on *À voir*, but mutinied outright at the ramifications of *Être*.

Seeing that the child was making poor progress, and as it was out of the question to dismiss a governess who had been entrusted with the three daughters of the Duchess of Dulworth, Lady Durwent sent for reinforcement in the person of the organist of their church, and bade him teach Elise the art of the piano. With the dull lack of vision belonging to men of his type, he failed to recognise the spirit of music lying in her breast, merely waiting the call to spring into life. He knew that her home was one where music was unheard, and his method of unfolding to the girl the most spiritual and fundamental of all the arts was to give her *SOLES*. He was a kindly, well-intentioned fellow, and would not willingly have hurt a sparrow; but he took a nature doomed to suffer for lack of self-expression, and succeeded in walling up the great river of music which might have given her what she lacked. He hid the edifice and offered her scaffolding—then wondered.

II.

Elise was consistent in few things, but her love for Richard, the youngest of the family, was of a depth and a mature tenderness that never varied. Doomed to an insufficient will-power and an easy, plastic nature that lent itself readily to the abbreviation 'Dick,' he quickly succumbed to his fiery-tinted sister, and became a willing dupe in all her escapades.

At her order he turned the hose on the head-gardener; when told to put mucilage on the rector's chair at dinner, he merely asked for the pot. On six different occasions she offered him soap, telling him it was toffy, and each time he bit of it generously and without suspicion. Every one else in the house represented law and order to him—Elise was the spirit of outlawry, and he her slave. She taught him a dance of her own invention entitled 'The Devil and the Maiden' (with a certain inconsistency casting him as the maiden and herself as the Devil), and frequently, when ordered to go to bed, they would descend to the servants' quarters and perform it to the great delight of the family retainers.

A favourite haunt of theirs was the stables, where they would persuade the grooms to place them on their father's chargers; and they were

frequent visitors at feeding-time, taking a never-ending delight in the gourmandism of the whinnying beasts, and finding particular joy in acquiring the language and the mannerisms of the stablemen, which they would reserve for, and solemnly use at, the next gathering of the neighbouring gentry.

When Elise was ten and Dick seven, she read him highwaymen's tales until his large blue eyes almost escaped from their sockets. It was at the finish of one of these narratives of derring-do that she whispered temptation into his ear, with the result that they bided their opportunity, and, when the one groom on duty was asleep, repaired to the stables armed with a loaded shot-gun. After herculean efforts they succeeded in harnessing Lord Durwent's famous hunter with the saddle back to front, the curb-bit choking the horse's throat, the brow-band tightly strapped around the poor beast's nostrils, the surcingle trailing in the dust.

With improvised masks over their faces, they mounted the steed and set out for adventure, the horse seeming to comprehend its strange burden and stepping as lightly as its tortures would permit, while the saddle slid cheerfully about its back, threatening any moment to roll the desperados on to the road.

They had just emerged from the estate into the public highway, when a passing butcher's cart stopped their progress. The younger Durwent, who had been mastering the art of retaining his seat while his steed was in motion, was unprepared for its cessation, and promptly overbalanced over the horse's shoulder, reaching the road head first, and discharging a couple of pellets from the shot-gun into a fleshy part of the butcher-boy's anatomy.

The groom was dismissed; the butcher-boy received ten pounds; Richard (when it was certain that concussion of the brain was not going to materialise) was soundly whipped; and Elise was banished for forty-eight hours to her room, issuing with a carefully concocted plan to waylay the rector coming from church, steal the collection, and purchase with the ill-gotten gains the sole proprietary interests in the village sweet-shop.

There is little doubt but that the *coup* would have been attempted had not Lord Durwent decided that the influence of his sister was not good for Dick, and sent him to a preparatory school at Bexhill-on-Sea, there to imbibe sea-air and some little learning, and await his entrance into Eton.

Robbed of her brother's stimulating loyalty, Elise relapsed into a sulky obedience to her governess and her mother. To their puny vision it seemed that her attitude towards them was one of haughty aloofness, and everything possible was done to subdue her spirit. Being unable to see that the child was lonely, and too proud to

admit her craving for sympathetic companionship, they tried to tame the thoroughbred as they would a mule.

Only when Dick returned for holidays would her petulant moods vanish, and in his company her old vitality sparkled like the noonday sun upon the ocean's surface. And if her affection for him knew no variation, his was no less true. The friendships and the adventures of school were forgotten in the comradeship of his sister as, over the fields of Roselawn or on the tennis-court, they would renew their childhood's hours. He taught her to throw a fly for trout, and she initiated him into the mysteries of answering the calls of birds in the woods. Mounted on a couple of ponies, they became familiar figures at the tenants' cottages, and though the spirit of outlawry mellowed with advancing years, Lady Durwent never saw them start away from the house without the uneasy feeling that there was more than a chance they would get into some mischief before they returned.

In the meantime the elder son was bringing credit to his ancestors and himself. His accent became a thing of perfection, nicely nuanced, and entirely free of any emphasis or intensity that might rob it of its placid suggestion of good-breeding. His attitude towards the servants was one of pleasant dignity, and the tenantry all spoke of Master Malcolm as a fine young gentleman who would make a worthy ruler of Roselawn.

Between him and Richard there was little love lost. The elder boy disapproved of his hoydenish sister, and sought at all times to

shame her tempestuous nature by insistence on decorum in their relations. Richard, who invariably brought home adverse reports from school, could find no fault in his colourful sister, and blindly espoused her cause at all times.

On one occasion, when Malcolm had been more than usually censorious, Dick challenged him to a fight. They adjourned to the seclusion of a small plot of grass by a great oak, where the Etonian knocked Dick down five times in succession, afterwards escorting him to the cook, who placed raw beefsteak on his eyes.

It was characteristic of the worthy Richard that he bore his brother no malice whatever for the punishment. He had proposed the fight, conscious of the fact that he would be soundly beaten, but he was a bit of a Quixote—and a lady's name was involved.

And no nurse ever tended a wounded hero more tenderly than the little copper-haired creature of impulse who bathed the battered face of poor Dick. Wilful and rebellious as she was, there was in Elise a deep well of love for her brother that no other being could fathom. And it was not his loyalty alone that had inspired it. Her solitary life had quickened her perceptive powers, and intuitively she knew that, in the years before him, her weak-willed, buoyant-natured brother would be unable to meet the cross-currents of his destiny and maintain a steady course.

But he thought it was because of his swollen eyes that she cried.

(Continued on page 32.)

SABA—WHERE THE DUTCH RULE THE AMERICANS.

By the Rev. MONTAGUE L. FOYLE.

I.

THE beautiful little island of Saba is probably one of the least known of the West Indian group, and is to be found marked only on maps drawn to a large scale. Situated in latitude 17° north and longitude 63° west, it lies about twenty miles to the north-west of the town of Basseterre, St Kitts, from which port there is a regular weekly mail service by sailing-vessel. Passengers from New York to the Leeward Islands are familiar with the rock, for it is a recognised landmark for southward-bound ships, and is generally sighted a few hours after leaving St Thomas, the newly acquired colony of the United States. Grim and forbidding, Saba rises sheer out of the sea, inevitably prompting the question, 'Does anybody live on such a place as that?' Yet the little island, which is twelve miles in circumference, supports a population of about two thousand people, and is very interest-

ing as one of the few islands possessed by Holland in the West Indies.

It is impossible to discover much about the early history of Saba. The original Carib inhabitants were left in undisturbed possession till the first half of the seventeenth century, when the Dutch, having gained a footing on the neighbouring islands of St Eustatius and St Martin, descended on Saba and hoisted their flag. As in all the West Indian islands, the coming of the white man meant the extinction of the Carib. In those days of war and commotion it was only natural that the island should frequently change hands, and in 1781 it was captured by the British, who, however, restored it to the Dutch at the Peace of Versailles in 1783. War breaking out again, Saba was recaptured by the British in 1801, only to be restored to its original owners at the Peace of Amiens in the following year. Yet once more the island was destined to undergo precisely the same change, for in 1810 the British

descended from St Kitts and hoisted the Union-Jack, to lower it again in favour of the Dutch colours by the decision of the general Peace of Paris in 1814. Since then Saba has been uninterruptedly in Dutch possession, and at the present day it is included in the colony of Curaçao, being the smallest of the six islands comprised therein.

II.

A visit to Saba is attended by even more difficulties than are usually to be encountered in voyaging to such isolated spots, and the trip can be recommended to none save those who are good sailors and active of limb. In addition to the usual discomfort connected with sloop travelling, there are peculiar natural features that make the journey an adventurous one. The island is really the summit of an extinct volcano, and the land consequently descends precipitously into the sea, with five fathoms of water close in to the shore, and deep water at less than one hundred yards from it. The erection of a pier is thus impossible, and as there is neither creek, inlet, nor bay of any kind, anchorage is a matter of extreme difficulty. Navigators always try to avoid arriving during the night; whilst, if their stay is not for long, they generally refrain from coming to anchor, and beat up and down along the coast pending the coming off of the shore boat. Agonising in the extreme to those who suffer from seasickness is the frequently prolonged wait till the rowboat is pushed off; and when she does come alongside the larger vessel, the problem of transshipment is difficult, as the two vessels pitch and toss side by side in the normally rough sea. It says much for the skill of the sea-loving inhabitants of the island that large cargoes are frequently thus landed, and that seldom is any damage reported.

The traveller, on reaching either of the two landing-places, called respectively the Fort and the Ladder, looks round in bewilderment for a town, for at neither place, save for a small military guardhouse, is there any sign of life. In front of him there stretches at both landings a long series of steep steps, and these must be climbed if the town is to be reached. One modern convenience is ready to hand, however. The Dutch Government found it absolutely needful to provide some means of communication between the landing-places and the interior, so each guardhouse is equipped with a telephone. The service extends all over the island, and it is interesting to note that, though the system was installed by the Dutch Government, the contract was given to British electricians from St Kitts.

The climb before the traveller is really up the mountain-side and over the lip of the volcano, and the visitor is amazed to see how readily the Sabeen porters will lift up a barrel of cement, a

bag of flour, or even a case containing a piano, and commence the arduous ascent. It should be stated, however, that the cost of landing and portage is in proportion to the difficulty, and that anybody moving into the island with heavy furniture must be prepared to pay. The writer was recently charged six shillings for his landing and the carrying up of a small handbag. But with all the difficulties, the climb up the mountain-side is magnificent, and the first ascent is never to be forgotten. 'Switzerland in the Tropics,' exclaimed one new arrival, and the description is not far wrong. Up and up the steps lead, huge towering rocks project on each side, and there is an appreciable fall in the temperature. Still higher and higher the steps lead, till at last the lip of the crater is reached, and there before the visitor, lying snugly tucked away in the crater's bowl, is a small and beautifully kept town known as the Bottom, with a population of about 800. Nowhere, perhaps, in all the West Indies can so trim a little town be seen—three parallel streets, carefully sanded; a population almost entirely white, each family owning its own house, and vitally interested in the upkeep of its property; excellent public buildings in the shape of Anglican and Roman Catholic churches, the school, Government House, and the guardhouse. And the interiors of the dwellings are as spick-and-span as the outsides. The well-painted walls are spotlessly clean, whilst the carefully polished floors give the impression that the owners have nothing else to do but to maintain them in the highest state of slippery glaze. Residents in the West Indies are all too familiar with the squalor that is found in town life as soon as the investigator has pierced the thin veneer of respectability seen on first acquaintance. The people have not yet been able to emancipate themselves from all the legacy of suffering resulting from the curse of slavery; but in Saba slavery never had any extensive hold, for the formation of the land rendered large estates impossible, and the white people simply kept one or two well-reared and carefully trained blacks as personal servants. The results are seen to-day in the orderly and tidy appearance of the community, and the overwhelming preponderance of the white population—the latter a unique feature for a West Indian island.

III.

But the Bottom does not by any means exhaust the population of the island. Leaving the bowl of the crater with its strange sense of shut-in-ness, the traveller climbs by an even steeper and more arduous flight of steps than that which gave him entry, over the opposite lip of the crater, and makes his way along a narrow track with sheer precipice on the right hand and towering rock on the left, till a second collection of houses, known as the Windward, is reached. Here,

again, are to be found the same tidiness, pride of home, and general neatness that seem characteristic of the people of the island. Here, also, are Roman Catholic and Anglican churches, a fairly well-stocked store, and a school. The view on the journey from the Bottom to the Windward is magnificent. There is the backward view of the town in the bowl; there is the sheer precipice at one's feet right down to the sea; there is the seaward view as the islands of St Kitts, St Eustatius, St Barth's, and St Martin successively unroll. The volcanic formation of the island is evident in the sulphur on the rocks and the frequent small fissures in the earth, some emitting slight jets of sulphurous vapour. From the Windward the traveller can continue by an even more difficult path along Jacob's Ladder (a very descriptive name) till he reaches Hell's Gate (an equally graphic title). From there it is possible to continue to the disused sulphur-mine, where Dutchmen a few years ago sank and lost much capital; and thence a very difficult track continues right round the island to the Bottom, passing the isolated village of Mary Point on the way. Here intermarriage and inaccessibility have done their work, and the place is known locally as the 'Idiot Village.' The few horses in the island are trained to ascend and descend the steps. Visitors are generally glad to ride up, but it is wonderful how quickly any but very experienced horsemen dismount as soon as the horse begins to descend. Those who do ride the downward journey show a wonderful tendency to do so with their arms round the horse's neck.

The original settlers must have comprised only a few families. Five surnames predominate. Everybody is either a Johnson, an Every, a Peterson, a Hassell, or a Simmons. Of public water-supply there is none, every house being guttered into a cistern where the rain-water is caught and stored. The Windward side is bathed in a perpetual cloud, and the temperature there is delightful, averaging fifty-five degrees. Blankets are needful at night-time, and if only Saba were more accessible, it would serve for the jaded Englishman in the West Indies as the bill-stations do for his fellow-countrymen in India. The high land in Saba is probably the only place in these islands where the common potato can be successfully grown, and the extensive bright-green fields so planted in this Dutch West Indian isle are very home-like to English eyes. The potato seldom, however, grows much larger than the Jersey new potato is when first put on the London market in spring, whilst the price is invariably sixpence a pound.

The method of burial is something out of the ordinary; there are no cemeteries, and interments take place in the gardens of the houses. A story is told of a certain funeral which

consisted simply in passing the coffin out of the bedroom window into the prepared grave beneath, after the parson had read the service.

IV.

A Hollander coming to the island might find it difficult to realise that he was arriving at one of the possessions of his country. He would be able to salute his flag, and in the persons of a small detachment of soldiers and the Roman Catholic priest, would be able to greet his fellow-countrymen; but there the Dutch aspect of Saba ceases. Years ago the custom grew up (in all probability in consequence of the colour question views of America) of U.S. schooners short of crews in the West Indies coming for recruits to the only island where the captains could be certain of obtaining white sailors. The result has been the gradual Americanisation of Saba. Man has followed man till the bulk of the remaining population consists of females, whilst family after family have husband, father, and brothers sailing out of New York. All over the world these Saba men go, as the mail-bag reveals, till it is the proud boast of the island that its sailors can be found in every port. Naturalisation naturally follows this exodus; and then, as soon as possible, the men send for their womenfolk, and a home is made under the Stars and Stripes. The clannishness of the people is wonderful, and the excellent condition of the houses is almost entirely due to money sent from the States. It is the photographs of Taft, Roosevelt, and Wilson that adorn their walls; New York is the place towards which the thoughts of the people turn; and the American mail is *the* mail, in strong contrast to the small bag containing perhaps half-a-dozen letters from Holland. English is the language used for all save official purposes. American paper money pours into the island by every mail, and Dutch coin is hard to obtain. Frequent applications are made to the sister-islands for Dutch money at a premium, and when visiting Saba recently, the writer was begged to bring all the Dutch coin he could in exchange for American bills.

It should, however, be said that the people are in no sense disloyal to their mother-country, or ungrateful to her for what she has done. It is simply that Holland is so far away, and her immediate influence on the inhabitants' lives so small, that the vastly greater and more accessible republic to which their bread-winners have gone has claimed and held their interest. Saba, indeed, raises the whole question of the influence of the United States in the West Indies, and serves to remind us that, even in these days, peaceful penetration still remains a strong factor in international life. Since the war with Spain, Porto Rico has been a definitely American colony; the Danish islands of St Thomas, St Jan, and St Croix were recently acquired by the United

States; American influence is paramount in Cuba, whilst order has been restored through her intervention in San Domingo and Hayti, an island of infinite promise. One sometimes wonders

whether the hoisting of the Stars and Stripes in other islands besides the ex-Danish Virgins would produce any very violent change in the national outlook of the population.

THE MAN WHO CAPTURED THE KAISER.

PART II.

VI.

PARKERLY was gone not five but ten minutes, and then returned, accompanied by Warlingham, whom I now remembered to have met once before, though only for a few minutes. A friend had stopped to speak to me in Roysbury High Street. He was accompanied by a man unknown to me, whom he casually introduced, as I now recalled, by the name of Warlingham.

'How do you do, Mr Warlingham?' I said when he came in with Parkerly. 'We have met before. Didn't Captain Harley introduce us to each other about a year ago?'

Warlingham remembered the incident, and said as much, listlessly.

He was a strangely melancholy man, haggard, sunken-eyed, hollow-cheeked, and with a dull, apathetic note in his voice. Under the excitement of mania he could, as I learned later that evening, fire up into another being. Now he sat cowering over, and staring fixedly into, the fire, his back to Parkerly and me, unaware, one might have thought, even of our presence, except for an occasional murmur of assent to Parkerly's questions.

It is unnecessary here to detail the questions, and Warlingham's replies. They confirmed in every respect what Parkerly had told me of the night's happenings; but it was only when asked whether, now that the abduction was an accomplished fact, he did not think that Parkerly had acted in his friend's best interests in carrying him off, even forcibly, to prevent the proposed removal to an asylum, that Warlingham showed the least interest in the matter.

'I do,' he snarled, turning almost tigerish eyes on me. 'I am here by my own wish and my own consent, and here I intend to remain. It will go ill with any one who interferes in a private matter like this, which in no way concerns him.'

Being only a special constable with limited powers, and not a commissioner in lunacy, or even a friend of Warlingham, the facts as stated by Parkerly, and confirmed by Warlingham, left me no option but to leave things as they were, for that night at least, and to retire.

But I was far from being satisfied that what I had been told was true. Once before I had had to do with a madman, and had heard from his lips a story more cunningly and craftily framed to hoodwink than any merely sane man

would have been likely to conceive. On that occasion the madman, if I may avail myself of metaphor, had been so anxious lest a neighbour should identify as his (the neighbour's) property a stolen chicken that he plucked off and burned each separate feather, but overlooked the fact that the bird's body was lying, to be seen of all, on his (the madman's) floor. There was no oversight of that sort in this case, and—remembering that both madmen and criminals, while cunningly obliterating all tell-tale footmarks, are apt to leave the much more easily identified evidence of finger-prints uneffaced; or, while hiding away ninety-nine clues, often leave the hundredth clue exposed—I could not but admire the ingenuity of the story told by Parkerly and confirmed, as I say, by Warlingham.

VII.

One factor, however, remained to be considered. My impression was that the man who had been abducted was of medium height, whereas Warlingham stood at least five feet eleven inches. Instead of showing my hand (one must go warily with madmen) by speaking what was in my mind, I made another excuse for inquiring further into the matter.

'Look here, Parkerly,' I said. 'You want me to hold my tongue about what's happened. You have given me a very satisfactory explanation, which your friend, Mr Warlingham here, confirms. But an abduction is an abduction, and if any one gets gossiping and the facts come out, it will be extremely awkward for me. One can trust gentlemen not to talk. But there's some one of another class, your manservant, mixed up in all this. He *may* talk, especially when he is having a glass or two with friends; rumours may get about, inquiries be made, and everything come out. That might put me in a very deuce of a hole for dereliction of duty, or perhaps for compounding a felony. Send your man here. A few words with him will satisfy me whether he is or is not to be trusted, and then I shall feel less uneasy.'

I have noticed on one or two occasions that a madman, when trying to deceive you, soon tires. He is not good—in deception at least—at a waiting game. His mania is different. In that he whole-heartedly believes, while it lasts, and can sustain his interest. But of playing you some mad trick, some crafty deception, he soon wearies. It was so now with Parkerly.

He was screwed up by the excitement of the abduction when I arrived, and though badly taken aback, as I have said, when I sprang my first surprise upon him, he recovered himself quickly, and in replying to my challenge he handled his rapier with skill and cunning. Now he had tired of the game, and tiring of it, he had lost interest, and played it but ill.

To my request that his manservant be summoned he did not at first know what to say. His confusion was evident. Then he tried lamely—his confidence in his ability further to deceive me evidently gone—to fob me off by mumbling something to the effect that his man lived out of the house—lived, in fact, two miles away—and was now comfortably in bed. A curious change had for some time been evident in the two men. Almost in the very proportion in which Parkerly tired, Warlingham rallied. It was Parkerly who now sat sunken in thought, staring moodily at the fire; while Warlingham either sat erect in his chair to face me, as Parkerly had hitherto done, or else paced the room restlessly. It was as if, as in the incident recorded in the Bible, the spirit which was driven out of the one man, whether an evil spirit or a spirit of dementia, had entered into the other.

'We have had enough of this fooling, Parkerly,' Warlingham said. 'Can't you see for yourself that Mr Dee doesn't believe us; that he is bluffing us, in the hope of finding out the something more which he believes lies behind what he has been told?'

It was now my turn to stand on the defensive; but I did no more than make a perhaps feeble gesture of polite remonstrance.

'Bluffing, Mr Dee,' Warlingham went on, turning to me, 'succeeds once in a while, in warfare and diplomacy, but the risk of a failure is so great—for to fail in your bluffing means that you have exposed your own weakness to the enemy—that when a wise man bluffs, it generally means that he is desperate, that he is playing his last card, and that it's a case of "win all" or "done in." The only safe bluffing is when you play a high court-card, knowing that your opponent has no trumps, and that, if he plays a card higher than yours, you have a higher one still—the ace—to throw down. Tell us frankly whether you have another high card up your sleeve, Mr Dee. It will save your time and ours.'

'Yes, I have,' I said.

'You mean that you know it was *not* Parkerly and his man who carried out the abduction?'

'Exactly.'

'And what do you propose to do?'

'I propose to report the entire matter to the chief-constable,' was my answer.

'The chief-constable!' he repeated contemptuously. 'The chief-constable—of a little, pettifogging place like Roysbury! And this is

an affair of State, and of the highest moment! Now, Mr Dee, I am going to be frank with you. It is the only course left, since you have, inadvertently, I admit, tumbled upon a State secret of vast consequence.'

VIII.

'People here,' resumed Warlingham, after a solemn pause, 'think that Mr Parkerly and I are mad. They are welcome so to think. In fact, we *wish* them so to think; it suits our purpose. I am going to tell you, sir, what no other person in Roysbury—no other person in England, or the Empire, except His Majesty the King (whom God preserve), the War Council, and Sir Douglas Haig—is aware of. First, I may tell you that Mr Parkerly and I have been for the last twelve months His Majesty's chief advisers and confidants. Each day we send, in duplicate, our directions for the strategy and conduct of the war—one to go direct to Haig, the other for His Majesty's confirmation and approval. These affairs of State often keep Parkerly and myself at work far into the night. Now His Majesty has commanded us to add to our other onerous war duties those of Heads of the Secret Service. We lied to you to-night before we knew what facts had come into your possession. In the Secret Service one must lie, if necessary, for we in the Secret Service owe no responsibility to any one except the Sovereign. In our capacity as Heads of the Secret Service we have made a stupendous discovery. When you hear what it is you will realise how terrible for you would have been the consequences if you had brought down upon yourself His Majesty's august displeasure, and the very heaviest punishment which the Defence of the Realm Act has in its power to inflict for any interference on the part of unauthorised persons, even if mistakenly, in a matter so momentous, affecting the safety of the throne, the nation, and the Empire.

'We have discovered that the Kaiser is in England. He has succeeded in getting into England secretly, but upon what infamous and monstrous errand is as yet known only to himself. The issues which could induce him to take so perilous a course must be tremendous.'

'The Kaiser in England!' I said.

'Yes, in England. In this very town of Roysbury. It was he whom Parkerly and I tracked down this very night, and have made our prisoner. Think of it! The Kaiser in England! In Roysbury! And disguised as a Spanish musician!'

'A Spanish musician!' I almost shouted, light breaking in upon me with a rush, for now I knew why the cloaked figure of the man in the Homburg hat had seemed so strangely familiar. It was seeing him by night and on a country road that had played a trick with the connecting telephone centre of my memory, and

switched it off upon a wrong 'line'—that of celebrities as they appear in public, or as portraits in the illustrated journals and the shop windows. Had I seen that cloaked and Homburg-hatted figure strutting, as I had seen it strut any time for the last ten years, along the Roysbury Marine Parade, I should have recognised it half a mile away for whom and what it was, as one of the most amiable, harmless, and innocent of men, who, except for a fiercely upturned moustache, was as much like the Kaiser as the Kaiser is like Mr George Cadbury.

'A Spanish musician!' I repeated—'the Spanish musician whom one meets on the front in the morning, and sees comfortably listening to the band each evening and afternoon!'

'The very man!' replied Warlingham gravely. 'Wonderful disguise as it was, Parkerly and I penetrated it. The heavens above us only know what colossal and awful national tragedy and ruin has been spared the nation and the Empire by the discovery. Come this way, Mr Dee.—Will you bring the light, Parkerly?—You shall see the arch-monster for yourself, and knowing what you now know, you will instantly recognise him, in spite of his disguise, as the Kaiser.'

IX.

With my head in a whirl, and wondering whether that poor little mild-as-a-mouse-mannered Spanish musician were still alive—for I knew him to be nervous enough to have died from the fright of being thus forcibly abducted—I followed Warlingham and Parkerly down some stairs to where was a cellar door, on which half-

a-dozen brand-new bolts and locks had been laboriously placed.

'We take no risks, you observe, Mr Dee,' said Warlingham significantly.

Five minutes at least went by in unlocking and unbolting these multitudinous fastenings. Then Warlingham flung the door open and said grandiosely, 'Majesty, I have the honour to present to you Mr Kenneth Dee.'

The cellar was empty.

Opening out of it was a door which led into a second cellar, apparently for the storage of coals, for at the farther end was a coal-shoot, closed by a hinged and downward-falling shutter.

When the prisoner was thrust into the inner cellar, the shutter closing the coal-shoot in the outer one had possibly been closed and secured by the two heavy iron bolts which I now saw in position there. But with the curious non-coordination of ideas not uncommon in the insane, neither Parkerly nor Warlingham had noticed that, though they had put half-a-dozen new bolts on the first cellar's outer door, the flap-door closing the coal-shoot of the inner cellar was bolted from the inside.

Hence there was nothing to prevent any one locked in the cellar from unbolting these, wriggling through the opening, and so climbing upward and out.

Which appears to have been the eminently sane and sensible course followed by His Majesty the Kaiser, *alias* Señor Montana, a retired Spanish musician now resident at Roysbury.

THE END.

THE TASTY ALBACORE.

By P. R. GORDON.

CALIFORNIA has more natural attractions and strange industries per square mile to offer the tourist and the intending settler than is the case, probably, with any other of the states forming the Union, and fishing for and canning the albacore are not the least of these.

The albacore, a deep-sea fish of the same species as the tuna, or tunny, is at present known to be found only along the southern California coast, ranging from Santa Barbara to San Diego. In the stretch of water between these two coastal towns it is to be seen in large numbers during its season—that is, from early June until late January—and it is easily caught with line and hook. The American Government has, the writer understands, undertaken the study of the habitat of this fish, with a view to determining, if possible, whether or not it exists off other coasts of the great continent.

The albacore is considerably smaller in weight than its more favoured rival, the giant tuna, rarely exceeding sixty pounds, whereas the giant

tuna has been known to weigh more than ten times as much.

During the season of the tuna and the albacore, enthusiastic anglers from all over the globe are to be found at that Mecca of all true followers of Izaak Walton, beautiful Avalon, on Santa Catalina Island, southern California, enjoying to the utmost the excitement and the pleasure attached to the sport of fishing for these gamy denizens of the sea.

Although the tuna is to be found in such widely separated localities as the Mediterranean, the stormy waters of the Newfoundland coast, and off Tasmania, the true albacore, as has been said, appears to confine itself to the waters of the Californian coast.

Some dozen years ago a small experimental cannery was started in California solely for the purpose of canning the albacore. It was a success practically from the commencement. The industry has now progressed far beyond the experimental stage, and has established itself

firmly among the many important industries of California.

The albacore is considered, as a delicacy, to be the equal of, if not superior to, the salmon, and it has always had a good market and been favourably commented upon wherever it has been introduced. Though it is canned under the name of tuna and albacore-tuna, it would be more correct if its proper name of albacore were used by the packers on their labels.

At the beginning of the season the fish is somewhat scarce as a rule, and immature for canning purposes, ranging in weight from fifteen to twenty pounds; but later on, as the season advances, and especially towards the close of the season in January, the average size runs from thirty to forty pounds.

The fishing for albacore is, to a great extent, in the hands of the Japanese, who are extraordinarily successful in catching this fish. The method adopted by them is to use outriggers, composed of heavy cane-poles, projecting from both sides of the boat, thus enabling each fisherman to make use of four lines or so. Another method, one used by the writer, is to trawl for the fish with heavy lines fastened at the ends with a heavy bone jig hook. When the boat is moving at a fair speed the hook is constantly skimming along the surface of the water, and acts as a bait to the voracious albacore, which snaps at it, thinking it to be a live sardine.

The fish is erratic in its movements, suddenly appearing in the coast waters, remaining for a short time, and then disappearing, to return again after an interval of a week, sometimes longer, only to repeat the performance. Some seasons, again, the fish is much more plentiful than other seasons.

At San Pedro, southern California, the home of the albacore-canning industry, there is a large fleet of swift, up-to-date fishing-boats, mostly gasolene launches, built specially for deep-sea fishing, and engaged almost exclusively in albacore-fishing for the packing-houses there.

Each morning at daybreak it is customary to find the boats on their way to sea in search of a 'school,' for albacore, like mackerel, always run in large shoals. On board each boat will be a barrel of live sardines, and when a 'school' is sighted the launches are steered towards the centre of it, where one can see a wild conflict being waged by the albacore upon a shoal of frightened sardines. To attract the attention of the fish to the boats, the fishermen, usually numbering four to each launch, proceed at once to throw overboard handfuls of sardines from the barrels. A tremendous scramble then takes place, the greedy and excited albacore snapping up these sardines almost as soon as they touch the water. This is the fishermen's opportunity. They immediately lower their strong, short lines, baited with sardines, into the mass of fish darting to and fro in the water,

and for some time the excitement on board is intense and infective.

That superstitious element (believed in so thoroughly by those who fish for their living) called 'fishermen's luck' enters largely into this business. A large 'school' will sometimes be sighted very early in the morning, but it more frequently happens that the boats travel many miles, and are out until nightfall, before they meet with success. Quite often too, day after day, they may have no luck at all. Supposing a 'school' is sighted early in the morning, it is quite possible for the fishermen to be back again and tied up at the wharf by noon. Occasionally a very fortunate crew may return with a load of as much as four tons of fish. This, however, is exceptional, as the average catch does not exceed 800 pounds.

Immediately the fish are caught they are cleaned, and the blood is allowed to drain, thus ensuring a perfectly white meat. If this is not done, the blood, which is very thick and rich, gives a very strong flavour to the flesh, making it most unpalatable.

While most of the fishermen engaged in this business are under contract to deliver to the packers all fish caught, there are others who work independently, and sell where they can obtain the best price.

On the boats reaching port, the fish are immediately transferred to the packers, who weigh them, and they are then removed to what is known as the draining-room, where they are hung by the tails until completely drained of blood. They are now taken down and laid on wire trays holding about five fish each. These trays are piled into rolling racks and run into sealed steam-tight cookers. After being thoroughly cooked, the fish are allowed to become quite cold, when they are taken in charge by a large staff of women, who remove all skin and bones, and cut the flesh into slices just large enough to fill a can, selecting only the whitest part of the meat, which is also the sweetest. Other parts, which are of a dirty clay colour, are not suitable for eating, being very strong-flavoured and rank to the taste. The pieces are packed into the cans with pure salad-oil.

The next step in the canning process is to carry the cans, by means of travelling chains running the whole length of the tables, from the packing-tables to the automatic sealers. The sealed cans are then placed in steam-tight drums, and are there left in live steam for such time as will allow the salad-oil to become properly cooked into the meat. After 'venting,' the cans are thoroughly cleaned and labelled, and packed into cases ready for shipment to all parts of the country and abroad. The finished product is a solid piece of white meat, delicious to the taste, and, unlike tinned salmon, entirely free of skin and bones.

THE CHILDREN OF THE CLOUDS.

By H. MORTIMER BATTEN.

I.

SO low in the heavens hung the pale March sun that its rays barely kissed the topmost ridges. The valleys and the glens lay black as ebony, and the only effect the sunshine had was to show how dark the sheltered hollows were, how gloomy and fissured and seamed was the whole vast mountain-range. So wide and desolate the country stretched that features which, in an ordinary view, would have served as landmarks were here mere pin-points on the infinite. An entire village lay within a single smudge of shadow; the majestic castle above the loch was dwarfed by the immensity of the loch itself, which, in turn, seemed insignificantly small in the overhanging presence of Bairnsface, a single boulder from the pinnacle of which might, had it rolled, have crushed village and castle into sand.

It may appear absurd, yet it is true that from the clouds high above the greatness of this scene five pairs of eyes watched for—*mice*! Here, where a church was as a grain of sand and man himself the merest atom; here, at an altitude from which ten thousand miles of land lay displayed below, those watching eyes sought for the quivering of a single blade of grass or the stirring of a mossy frond.

The birds looked large against the silver sky, though an uninterested observer would probably have passed them by as 'big crows.' But there was a majesty in their flight unknown to any crow, for, though it was blowing half a hurricane, they hung in mid-air with never a tremor or motion of the wings. For the most part they soared and glided in gigantic circles, but now and then one of them would remain stationary in space, head up-wind, for perhaps twenty seconds. Then, by a slight adjustment of the angle of its planes, it would rise giddily skywards, higher, higher, still with no motion of the wings, then turn in a sweeping glide that encompassed the whole vast mountain-side. So great was their wing-spread, so great the height, that they seemed to be moving slowly, and it was only when at length one of them came hurtling earthwards with wings almost vertical, swooping to the level of the topmost pines, that one realised the prodigious speed of that turning glide.

No, they were not crows, for there was a flash of silver as the bird rose in the face of the sun. Moreover, it might have been observed that at that moment there was a shudder of alarm all along the margin at that end of the loch. A group of tufted duck made for the driftwood; the gray hens feeding in the birch-trees stretched their necks and prepared for flight; even the

coots ceased to squabble and sped towards the rushes. Only the wise old heron—that gray post among the weeds at the corner of the lagoon—'never turned a hair.'

There were five buzzards soaring together, though what drew them together I cannot say. Probably it was purely a social attraction, for only two of the five belonged to this region. The other three had appeared from nowhere in particular, and with a joyous hail of 'Kew-kew-kew!' the five had temporarily united, to work the sunny side of Bairnsface from end to end with systematic care.

Bairnsface—a misnamed mountain, for never was a face so worn and seamed and furrowed by time—had long been a stronghold of the buzzards, and of the two that now lived there, whom we will call Buteo and Bute, one at least, probably Bute, the hen-bird, had first seen daylight from a shelf of the crowning crag. The previous spring the two had reared their young undisturbed, which was owing to the fact that the man with the gun was shooting elsewhere, so that it is more than possible that the three visitors hunting with them that day were their own children.

II.

The buzzard that had swooped was back in the clouds again. Why did they come to earth so seldom? Scarcely was the question asked when one of the five, she whom we have named Bute, began swiftly to descend. She did not dive or swoop, but merely erected her wings above her back till they were almost vertical and parallel, and so came steadily downwards till barely thirty feet above the heather, where she hung motionless in the wind.

Something directly beneath her held her eye. She was just behind the pine ridge where the bracken-beds ceased and the ling began, and here was a tiny pool of stagnant water, clear as the purest crystal. The pool was no larger than a man's jacket, and in the centre of it was a rather artificial-looking island of silver sand and green moss. Just beyond the island a split twig stood upright in the water, and held in the split in a most unnatural way was the head of a house rat. It was this minute morsel that had brought Bute, the hen-buzzard, falling through space from the gossamer clouds above.

She wondered a little, as well she might, but her eyes and her keen nostrils told her that the bit of rat was good buzzard food, and so she did the only thing there was to be done—she alighted on the island of moss and silver sand.

Click! Something sprang up to meet her as her feet struck the ground, something with

jaws of iron and the teeth of a vampire! It struck upwards like the strike of a rattlesnake, and in so doing flung one of her claws aside, while it caught the other in its shattering grip. Bute fell, her wonderful wings outspread across the pool; then, looking upwards at her friends, still free in the heavens, she uttered a plaintive 'Kew-kew-kew!'

Faint and melancholy, a mere atom of sound in the sky, the answer came. Her mate had heard her, and was now wheeling in her direction with one of those marvellous turning glides. He saw her with wings outspread upon the earth, and came swooping downwards through space—one mile, two, till he hung directly above.

'Kew-kew-ke-ke-kew!' cried Bute, and clutching the steel jaws of the trap with her free talons, she forced herself upright, tearing at the trap with her claws, lashing the water with her mighty wings, even raising the trap from its bedding. But to it was attached an iron chain with a drag at the end, and Bute could do no more than raise the hateful thing out of the pool and land it in the heather.

The three visiting buzzards heard and saw and understood, and they too came sweeping earthwards with cries of horror and dismay. Buteo glided nearer, his golden eyes aflame, his great wings skimming the heather above his fallen mate. The other buzzards wheeled not ninety feet above, screaming, calling, bidding her do her very best; and the keeper crossing the moor at that moment heard the bedlam, and knew what was afoot.

The three buzzards aloft uttered a frenzied warning as they saw the man turn their way. Buteo saw too, and with a desperate cry alighted by his mate. He clutched the trap in his talons, spread his mighty wings and fanned, and so, flying together, beating each other as they flew, they raised the trap a foot or so. But the chain dragged them down.

On came the man with the gun, slowly now and keeping to the hollows, for it had occurred to him that with luck he might 'bag the brace of 'em.' But Buteo took the warning from his friends above, and, calling to his wife to follow, skimmed away, to watch from a dead pine-limb on the ridge.

When Bute saw the man she made a desperate effort to escape, then sat back, looking at him with her wonderful golden eyes. She might have been asking the question, 'What have I done to you that you should treat me thus?' for there was no fear in those eyes, only pain and reproach. And the man who worshipped at the shrine of the game-birds gloated over her a moment or so, then laid down his gun and took a heavy stick from the ground.

A brace of grouse rose from the heather at his feet, and at that very instant one of the peregrines that shared the buzzards' cage on

Bairnsface came hurtling down-wind in one tremendous planing glide. He saw the grouse, and his wings zipped through the air within four yards of the keeper's head as he turned to follow them. Up he went in a dazzling swirl, then down—thud!—and a grouse came to earth through a cloud of feathers almost at the keeper's feet.

The man turned with an oath and snatched up his gun, but his movements were ponderous and elephantine compared with those of the aerial acrobat above his head. He fired as the falcon rose to stoop a second time, and missed by feet rather than inches. With a scream of mockery and triumph the peregrine struck down the second grouse before his very eyes, then dashed off behind the pine ridge, leaving the sacred game-birds where they had fallen.

The keeper stood and swore in Gaelic, so overwhelmed by such unspeakable audacity that he did not notice that his shots had frightened the imprisoned buzzard into another desperate effort to escape. The wafting of wings aroused him, and looking round, he saw two buzzards flying low, side by side, not eighty yards away. He gave them the choke-bore for luck, then turned to his trap with black and speechless looks. Between the jaws of it was held a buzzard's foot.

III.

Before the war buzzards and peregrines had been all but extinct along this range, and now it pained the keeper exceedingly to find that his absence abroad, together with that of other members of his calling, had allowed these 'renegades' a breathing-space in the very nick of time. The dwindling remnants had all but toppled over the edge of extinction—the noblest of our wild birds gone. But now the buzzard was afloat once more, the wild scream of the peregrine oft broke the quietude of the lonely corrie, and the man with the gun, who saw neither beauty nor romance in such life, set everywhere the engines for their downfall.

After Bute's encounter with the trap she and her mate flew straight to Bairnsface, and high on the topmost crags, a sheer four hundred feet from the broken slope below, they settled. The male bird alighted, as usual, on the dead branch of a wind-tortured pine, which, with the originality of its kind, had contrived to find roothold on a shelf where there was not enough earth to bury a mole. He would sit for hours on that naked stump, absorbing the view and the sunshine. And, ye gods, what a view it was! The hen-bird, wild-eyed and frightened, tried to alight on her favourite shelf, fell, and finally lay down on the moist, soft peat.

Whether she suffered much one cannot say, but it can scarcely have been otherwise. Patiently and bravely she set to work and trimmed the jagged stump. Her mate seemed not to know that any ill had befallen her. She

was sadly maimed, but the fact that she was free again was enough for him.

Next morning, with the first gray streak of dawn, Buteo was a-wing, soaring and gliding in the cutting gale, and calling to Bute to join him; but she was not there. The peregrine hurtled down from the blue, and landed, light as a thistle-seed, on a pinnacle of the crag. But at length Buteo saw her, seated so still that she might have been sleeping, down in the heather at the side of the burn a thousand feet below. She had gone there to drink, and now was resting, though, as her mate glided above with a joyous greeting, she spread her wings to join him. She spread her wings and beat the air, but, alas! she could not rise here in the deep heather. Those great planes were unable to catch and hold the air from so low a starting-point, for she had but one foot with which to give herself the launching spring. She struggled to an open space, frightened, mystified; and there, at last, the wind caught her wings and sped her upwards.

It was the last time the hen-buzzard was ever caught that way. Never again did she alight on closed-in ground, and when she took her quarry from the earth she merely skimmed the heather with her wings, flicking up her quivering prey as she glided by. Thus the keeper, all unwittingly, had produced a buzzard which would never be caught in a trap; and, since it is from their mother that young buzzards learn their hunting, who can say but that the disabled Bute may yet prove the salvation of her kind?

IV.

The wind shifted from the north, and now at last it bore the taste of spring. The lapwings left the lowland swamps, and wild and shrill their cheery calls rang out across the heather. The great flocks of curlews forsook the river flats and took to frequenting the vast bent allotments—screaming and alighting, soaring and hovering, like gigantic humming-birds. There was a stirring and an awakening in all the air. The noisy colony of jackdaws lower down the crag had long been busy stealing each other's sticks, and many of them had eggs by now. The ravens, midway down, had completed their nest, and spent hours admiring it. The peregrines were busy too; and directly below them, straight in view, a rock-dove had produced two of the purest, whitest pearls on a shelf of moss. She came and went a dozen times a day, gliding and alighting under the very eyes of those swooping freebooters; but among the people of the crag a truce was called at this season. The peregrines might strike her down a mile from home; here, in their stronghold, she was safe.

But in all this shifting and sorting the buzzards played no part. The female's leg quickly healed, and over the stump there formed a soft protecting pad. She had only

one foot with which to clutch her quarry, but since it was always of such a small and insignificant order, this handicapped her little. She fed chiefly on mice, which she swept from the ling and swallowed whole while flying; and the keeper on his rounds wondered why he so often found the bait flicked from the twig of his hawk sets, and the trap unsprung. Normally, Bute would have been busy at this season, but her injury left her sick and weak, and the dawning of the love moon found her quite unmoved.

No doubt it was the gleaming rock-dove eggs that caught the eye of the one real criminal of the cragland slope. Of inherent, devilish, snarling sin he was the material form. The peregrines might strike down many a noble game-bird, but their ways were open as the sky, and they cared not a jot for any man alive. This skulking prowler came by ways no man knew, and did bloody and unthinkable things in the shadowy alleys of the crags. He was no other than a huge wild-cat, barred and bristling, with eyes of emerald fire.

The hen-peregrine was basking by her nest when the wild-cat crept along the shelf and fell upon her. The great hawk struck out with a scream, the meaning of which all the crag folk knew. It sent Buteo shooting skywards from his twisted branch with a startled cry, while Bute came tumbling from the clouds to see what was amiss. And when they saw, their soft and plaintive 'Kew-kew-kew' changed to a chattering challenge.

The hen-peregrine, severely shaken, was sitting back on her tail with claws exposed, calling wildly to her mate; while the wild-cat, hunched and bristling, waited for a breach in the defence. He saw not the two descending shapes above till their shadows fell upon him; then he leapt to meet them with a hissing snarl, and was beaten back by savage wings. He turned to flee like the coward that he was, but Bute struck downward, and a wisp of feline fluff floated away. They forced him to turn and face them; then inch by inch, foot by foot, they drove him backwards to the edge. Back, back he crept, blinded, dazed by the maelstrom of lashing wings, snarling, hissing, striking wildly, till at the very edge he paused and crouched in the attitude of one who knows that he is done.

The buzzards might have relented now, for all they wished was to teach the cat the folly of invading their ancestral home, but at that moment the male peregrine came zipping over the brow, and saw with rage the big, ugly feline close by his newly finished nest. With a scream he dropped and struck—struck with a force that sent the great wild-cat whirling and clutching over the edge, to come to rest at length among the boulders far below. And there, while the female peregrine groomed her ruffled coat, the buzzards tore him limb from limb.

This was the sole occasion on which the buzzards showed their blood. There was none of that devilish ferocity about them which distinguished the peregrines. The buzzards killed only what they required for food, and, since their appetites were immense, they were seldom idle. The peregrines would dart at a baby rabbit, and when it escaped by the skin of its teeth, they would strike down a royal grouse in sheer ferocity, leaving it where it lay. Not so the buzzards. In a single day Buteo would kill a dozen moles, and having thus satisfied his needs, he would sit on the stunted bough, his feathers ruffled by the wind, and doze away the hours.

v.

The ravens hatched their eggs on the shelf below, and the hen-peregrine was busy sitting on her first blood-marbled clutch ere the hen-buzzard bethought herself to fall in with the will of her lord, and make the best possible of a bad job in completing the renovation of the old nest below the pine. She worked with a will now, and so did he, so that in a single day the nest was ready for their eggs.

At dawn the following day four men appeared at the brow of the cliff. One was the keeper. He carried ropes and a crowbar, while two of the others carried shot-guns, and one a long-range fowling-piece.

They peered over the edge, searching the face below, and high in the heavens overhead sounded the warning 'Kee-kee-kee!' of the tercel. His mate heeded it, and, rising from her eggs, launched outward into space. There was a loud report, and down she fell, a spinning, pitiable ball of feathers, to crash and rebound among the rocks below. 'Kee-kee-kee!' called her mate, and looking up, the men saw him descending in a spiral nose-dive.

'Look out!' cried the keeper. 'Here he comes!'

He came. He swooped towards his fallen mate, whose feathers, ruffled by the wind, spoke of the mystery of death to him, and high over her he hung on long, blue, tapered wings, calling, looking, wondering—wondering why she lay so still and limp.

Bang! Bang!

The long blue wings collapsed and he too fell, to lie beside his lady on the sweet and scented earth—no longer a dashing glory to behold, but merely a heap of bloody, crumpled feathers, from which the lustre faded with the fading of his life.

Farewell, little aeronaut! It cannot be otherwise while there are birds which men hold sacred to themselves; but I, who love the sport of the hills and the woods as much as any man alive, would see you protected, as I would protect any other rare and lovely thing.

A gratified grin curved the keeper's thick lips, while his keen eyes sought the sky above for any moving speck. And there he found the thing

he sought—two gliding points of black, circling, criss-crossing, as they flew against the silver clouds.

'That's them!' he said, meaning the buzzards. 'They'll come down soon as I begin to climb, so you want to be ready for them.'

The keeper knew every shelf and nesting-place of this ancestral home of a race of noble birds. By means of his rope he could gain the falcons' nest, and just below there, by the stunted pine, he would find the acerie of the buzzards. So down he went, his friends paying out the line. He took the eggs of the peregrines to exchange the priceless things for cash over the counter of a local taxidermist; then, at considerable peril, he climbed to the stunted pine. And here he found—an empty ravens' nest, lined by the buzzards, and ready for use!

Angry and disappointed, the keeper cursed his luck, then kicked the nest downwards into giddy space. Below him, on a shelf, he could see the glossy young ravens looking at him with their bright, inquiring eyes. To reach them was impossible, and he pondered a moment whether he should shower stones into the nest; but remembering that, whatever his own feelings, his employer had no quarrel with the ravens, he refrained from doing so, and shouted to the men above to haul him up.

High overhead, circling, watching, higher even than before, were the buzzards, and now and then a faint 'Kew-kew' wafted downwards on the breeze. The keeper knew that they had beaten him this year. He thought that they must be nesting on some other part of the crag which he did not know, for already the season was late, already the young grouse were a-wing. Little did he guess that it was the work of his own hands that had brought about this undesirable end, even as he had unknowingly produced a buzzard he could never trap.

A FAR-OFF VALLEY.

I THINK of a far-off valley,
Amid a lonely land,
Where, shadowed by a mountain,
Some wooden crosses stand.
There's no one in this valley
To tend the graves, where sleep
Those hearts from which there springeth
The flowers of peace we reap.
There's but the sun to scatter
Fair garlands where they lie,
The rain to weep above them,
The wind to breathe a sigh.

What of myself?—I live!
O God! why should I live
When nobler men must die?
O God! what can I give
My life to justify?
I think of a far-off valley,
Amid a lonely land,
Where, shadowed by a mountain,
Some wooden crosses stand.

Chambers's Journal

SEVENTH SERIES

THE 'IZZAT OF THE REGIMENT.

By Major W. R. FORAN.

I.

THE 'izzat of the Bhawelpur Light Infantry was the personal honour of every man in the regiment—and not without cause; for the word signifies prestige, honour, military reputation, *esprit de corps*, and a host of other things besides. Upon their colours, surrounding the crest—a dragon of fearsome aspect—were embroidered in letters of gold the names of eleven campaigns, and underneath ran their motto, in Persian, '*Taiyār Shiyā*,' which is to say, 'Ready and Fearless.'

It was essentially a regiment of the frontiers, made up of men of very different caste and race—Sikhs and Punjabis, Afridis, Pathans, and Waziris—and wherever war was being waged or unrest reported amongst the tribesfolk, there would the Bhawelpurs surely be found. Amongst the rank and file was a strong leaven of hillmen of the Border, who, coerced into submission in many grim and sanguinary little affairs of outposts, had, in the fullness of their admiration, sought service under the flag that had chastened their pride. The British officers, though mostly poor in this world's goods, were all rich in pride and a fierce exclusiveness, for it was traditional in the regiment that son should follow father in its service. Accordingly there existed between officers and men unbreakable ties of mutual affection and respect, which made greatly for efficiency. A corps wherein every man counts his life as of small value in matters which touch the honour of the unit does not include the word 'failure' in its vocabulary.

In the course of time it came to pass that Colonel Rice, who (like his father before him) had risen through all the stages from subaltern to the command, was placed upon the retired list, and journeyed home to a pension and distasteful idleness. He left behind him a great sorrow in the hearts of all who had served with him; for he was a man amongst men, sympathetic, yet a rigid disciplinarian, velvet or cold steel as the occasion demanded, stout of heart, and full of understanding. When he handed over to Major Trelawnay, his second in command, there were tears and lamentations in the native lines, and deep, inarticulate grief in the little Officers' Mess. The regiment was fit and trained up to

the very pink of condition, perfectly in tune, well-contented, and well-behaved—which last was in itself no mean achievement, for paragons of virtue do not flourish amongst the Bhawelpurs.

Trelawnay carried on with a quiet and thorough efficiency, and, because the heart of him was in soldiering, he felt a simple and comforting satisfaction in the fact that he was reaping the harvest of the faithful work of many years. He 'sensed' that he was approved of by all ranks under him; accordingly he waited for the confirmation of his appointment, and consequent promotion, to come through from Simla.

It happened, however, that the Commander-in-Chief held other views. He had long wanted to promote one of his Staff officers to a regimental command, and the retirement of Colonel Rice gave him an opportunity. In due course, therefore, word came to the Bhawelpurs at Wano, in Waziristan, that one Colonel Hosking had been gazetted to the vacancy.

Trelawnay was hit hard by this sudden shattering of his hopes, but he was too big a man to show bitterness at being superseded. At the same time, there crept into his secret heart grave misgivings. The regiment was difficult to handle, and he feared that long, unbroken service on the Staff was not likely to give an officer that delicacy of touch in handling men which was a fundamental essential. His doubts were shared by British and native officers alike, so that when Colonel Hosking arrived at Wano he was regarded with uneasy suspicion.

He proved to be a very polished gentleman, courteous and genial, mild-mannered and kind of heart; but the necessary underlying iron strength was lacking in him. His Staff work had developed him into a pattern of military theory, and had deprived him of every opportunity of controlling men. His breast was bright with the ribands of many decorations, yet they had not been won in the forefront of battle; his campaign medals he had earned not in the firing-line, but whilst serving on the Staff. In consequence his military experience had been gained almost exclusively from non-regimental sources; he had lost the knack of dealing with humanity in the raw; he thought in terms of units, not of individuals. This distinction is fine and somewhat subtle, but it is an important one nevertheless.

II.

Within a few days of his coming Colonel Hosking made his initial blunder. Instead of availing himself of the advice and the experience of his subordinate officers—which, in spite of personal opinions, were loyally at his service—he decided to rule the regiment after a system of his own devising. He ordered a full-dress parade, and announced his intentions in a speech of many honeyed words.

His unit, stiff and erect, in their turbans and scarlet tunics faced with emerald-green, listened to him in silence. They heard him promise to be their father and their friend, to be at all times accessible to all ranks, and learned that he desired their confidence above all things. Yet they were not impressed. They are strange men, these dwellers on the Border, and are full of an ingrained reticence; among them there are certain matters which may not be discussed.

The British officers exchanged glances, and held their peace; the native officers listened solemnly, and said no word; but a war-grizzled *hāvāldar* spoke swift words of anger to a sepoy who had whispered to his next file. When the parade had been dismissed, the men gathered into little groups and spoke of the matter. It was new to them, and in some subtle way it irritated them. They knew that the friendship and the strict justice of the British officers were theirs unasked, that the 'izzat of the regiment was their 'izzat too. It was a deep feeling that could not be shaped in words, and the colonel, their *kamān afsar sāhib*, had outraged their modesty in speaking of sacred personal things.

Colonel Hosking walked off the parade-ground with Major Trelawnay, and his bearing was jaunty and well satisfied; but the major's mind was full of forebodings that he could not voice. At the door of the Mess the colonel halted. 'I think now, Trelawnay,' he said with enthusiasm, 'that the men thoroughly understand me. I want them to look upon me as their best friend, and I propose to act on those lines myself. It's the whole secret of handling these fellows.'

The words surged up within Trelawnay, for he saw in the whole affair a confession of weakness; but he held them back, and his mouth twisted into a grim smile.

'My motto shall be kindness and gentleness in all things,' continued the colonel. 'Once let them know that they can bring all their private troubles to me, and be sure of my help and sympathy, and, by gad, Trelawnay, they'll follow me anywhere!'

Trelawnay felt constrained to protest. 'Justice they understand, sir, but kindness is usually translated as weakness amongst these men. In the hill-country, where most of our men are recruited, they don't have the word "kindness,"' he said.

Colonel Hosking looked swiftly at him; but the major was staring, his features set and his eyes unfocussed, out towards the rugged hills that cover the face of Waziristan. 'I'd like it clearly understood, Trelawnay, by all my officers, that I expect them to rule by kindness as well as by firmness, and I will not tolerate tyranny,' said the colonel bluntly. 'I shall hold a weekly *darbar*, where the men, irrespective of rank, can come to me with their complaints and worries. Kindly see that my wishes are made known.'

'Very good, sir,' answered Trelawnay stiffly, and saluted. He stood watching his commanding officer cross the Mess compound towards his own quarters. 'The Lord have mercy upon us!' he said softly. 'So "the old order changeth, yielding place to new;" and it's bound to lead to disaster. The colonel won't realise that he is dealing not with the glib-tongued Bengalis of Simla and Calcutta, but with men—and men of the Border.'

He sighed, and turned into the anteroom of the Mess. It was full, and there was the sound of many voices talking together. There came an awkward little hush as the second in command entered the room; and that, too, was a new thing amongst the Bhawelpurs. Briefly, Trelawnay repeated the colonel's orders, and turned to leave; but the adjutant drew him to one side.

'This will soon be no place for a self-respecting officer, sir,' he said. 'I'm thinking seriously of putting in for a transfer.'

Trelawnay studied the face of the younger man in silence. 'I shouldn't do that yet, Carter,' he advised at length. 'Better wait. I fancy that the colonel will soon find out that his policy is mistaken; and if he doesn't, we're going to want all the good men we've got to keep the 'izzat of the regiment safe.'

'All the same, sir,' said Carter uneasily, 'there's going to be hell to pay—you know that.'

'Don't squeal until you're hurt, my son,' advised Trelawnay gravely. He turned abruptly and left the Mess. He was passionately in sympathy with the adjutant, who voiced the general feeling, yet his loyalty and his fine sense of discipline kept him dumb.

III.

The first-fruits of the error of judgment came to light the following day. A certain sepoy, the recognised bad character of the regiment, but a fine soldier on service withal, one to whom fear was a thing unknown, appeared at orderly-room on a charge of using insulting language to a *naik*. The colonel heard the evidence, and the man, with thinly veiled insolence, admitted the charge. Then Colonel Hosking, as a special mark of clemency on taking over his command, dismissed the case with a warning as to future good conduct.

Trelawnay and Carter exchanged swift glances that were pregnant with dismay, knowing the inevitable result of ill-advised leniency, and the contagion of a bad example. Even the impassive faces of the native officers and the *hāvāldar* showed surprise and bewilderment.

It chanced that the adjutant, leaving the orderly-room for a moment, overheard the prisoner addressing the friends and kindred spirits who had gathered, half-afraid, to hear the consequences of his ill-doing.

'Ho, brothers!' exclaimed the sepoy boastfully, 'you see that I am free, for the *karnail sāhib*, hearing perchance of my great deeds, feared my anger. *Karnail Rice, sāhib bahadur*, was as a tiger in fierceness, and my fear for him and my love for him were great. This new *sāhib* is as mild as a she-goat, and we hillmen give neither fear nor love to she-goats—that is for women!'

He laughed loudly, and swaggered off towards his lines. On the way he met the *naik* who had put him on the charge-sheet, and he made a gesture of insult that put the black shame upon that proven warrior.

Sick at heart with helpless anger, Carter returned to the orderly-room. As he entered, two of the best *subadars* were making application to be allowed to retire on pension.

'We be old men, *karnail sāhib*, and have given over thirty years to the regiment, and now our *pension* is due to us; therefore let us go, *sāhib*.' They spoke in chorus with grave dignity.

Trelawnay and the adjutant were aghast at the swift development of the symptoms, for they foresaw a sequel of wholesale desertions, since the allegiance of the men of the Border, who are whimsy creatures, is hard to win, and harder to keep.

Trelawnay protested quickly. 'These two officers, sir,' he exclaimed, 'are most valuable men, of great experience and influence. It will be a most serious loss to the regiment if they leave us now, sir.'

'But they're both old men,' the colonel insisted. 'It is always bad policy to stand out against a lawful claim. Besides, it's a mistake to let any man think that he is indispensable. Nobody is.' He paused a second and looked into the non-committal faces of the two native officers. 'Requests granted!' he snapped.

Further protests were impossible. Trelawnay and Carter found something of great interest outside the screened windows, and their silence, and the silence of the other officers present in the room, was eloquent.

Orderly-room over, the colonel walked slowly across the parade-ground, and many eyes watched him. The British officers knew that he was stepping blithely to disaster; the natives, with their swift intuition, had weighed his qualities in the balance and found him wanting.

IV.

During the next seven days three veteran native officers applied for their pensions, and their applications were granted despite all objections; for Colonel Hosking, with the obstinacy of weakness, would not be turned from his mistaken principles.

Then the adjutant, writhing under the shame which was being put upon his beloved regiment, put in for a transfer to the Supply and Transport Corps, which, being strongly recommended by the colonel, in due course was sanctioned. The quartermaster applied for a Staff appointment, and, after a lapse of some weeks, went to it rejoicing. In a few months three of the British officers had departed on transfer to other regiments, with sorrow in their hearts, leaving heavier hearts behind them.

Trelawnay stood by the regiment, which was his world, and consoled the bitterness of his loneliness with the hope that something must soon occur to relieve the strain. The Bhawelpurs were consumed as by a great sickness. Discipline was relaxed, and slowly dwindled to vanishing-point; whilst crime increased daily. The unit, which had formerly been a model and a pattern, was an unhealthy mass of discontent and malpractice.

One by one the native officers resigned or took their pensions, until but two of the old-time men remained; and, what was worse, their places were filled by men of little worth who had fawned and lied their way to favour and promotion.

The new adjutant, one Roberts-Williamson, was a Staff officer friend of the colonel's, a man of weak character, utterly egotistical, and quite unfitted for the post—for an adjutant is a most important factor in moulding a regiment's moral. The new double-company commanders, with no real interest in the unit and its traditions, were men who preferred sport to soldiering. The best that could be said of the new quartermaster was that he meant well.

Before six months had passed, the Bhawelpurs were rotten with slackness. Colonel Hosking, always easily gulled by obsequiousness—a legacy from his life on the Staff at Simla—and blinded by his shibboleth of kindness, usurped the duties that belonged by right to other officers.

Trelawnay ate his heart out in silence. He saw that the colonel's passion for artificial popularity was the root of the evil; and the pity of it was that his intentions were of the best. In vain Trelawnay tried to pull things together; he was constrained to watch the decay of his beloved Bhawelpurs in an agony of helplessness.

The adjutant, like most weak men, was vindictive, and the Waziri sepoys had incurred his particular dislike. Accordingly he set to work to persuade the colonel that the two companies of Waziris were the source of all the trouble, and finally the companies in question were handed

over to him for a special disciplining. With his new powers, Roberts-Williamson proceeded to irritate his men by the constant imposition of fatigues and extra duties. Trelawney grieved to see the sepoy wearing surly faces, and smarting under the galling persecution; he overheard remarks in their lines that were significant, yet he was powerless to avert what was now inevitable. He protested to the colonel, who goaded him to bitter anger by treating him as well-intentioned but misguided.

'You seem to forget, Trelawney,' Colonel Hosking told him one day, when he had been urging discretion in handling the Waziris, 'that I am honestly fond of *all* my men, and I really believe that they reciprocate the feeling. The Waziris have always been bad men, and need more firmness than the others. Have you forgotten the last Waziri Expedition?'

'No, sir; I'm not likely to,' answered Trelawney, and he pointed to a long scar that furrowed the side of his head. 'I was adjutant then, and they gave me a little souvenir.'

'Then surely you realise that they are not particularly good characters?'

'I think they are all right, sir, when they are treated fairly; but that is not the case in this instance.'

'I disagree with you entirely, Major Trelawney; and I'm sorry that I must remind you that I am in command of the regiment,' retorted the colonel sharply, and abruptly ended the conversation.

That night a *jemaḍār*, going on leave, sought out the major in his quarters, and revealed to him in urgent words the perilous state of mind that was afflicting the Bhawelpurs; and his words were eloquent of the truth. Once again Trelawney went to the colonel, but succeeded merely in arousing his impatience and dislike.

Trelawney was afraid of actual mutiny.

The Waziris are not meek men, but high-stomached and full of pride. Their lives they count as of little moment, but their personal '*izzat*' is a sacred matter and at no man's service.

V.

Two weeks later occurred the anniversary of a battle wherein the Bhawelpurs had done much to turn defeat into victory, and had thereby covered themselves with glory. The colonel ordered that fitting celebration should take place. All parades were cancelled, bonfires were built upon the parade-ground, and the *subadar-major* was ordered to select athletes from the sepoys to perform their tribal dances.

The day dawned, and the regiment, delighted like children at the change from the usual routine, attended to a man. In the late afternoon a light was put to the bonfires, and as the yellow flames leaped hungrily towards the sky the colonel led his officers, dressed in the splendour of scarlet tunics, towards the dais

that had been constructed in the centre of the parade-ground. They seated themselves, and the colonel ordered the *subadar-major* to begin that part of the programme for which he was responsible.

Certain sepoys came forward with their instruments of music—*vinas*, with their sweet silver tinkling; *saringis*, strange stringed instruments; reed-pipes; and great kettle-drums.

The drums commenced to throb, and their changeless cadence smote and jangled upon Trelawney's nerves, though he was long familiar with the sound. Gradually a strangely mournful melody emerged from their pulsing background. A feeling of oppression stirred in Trelawney's heart, for the beat of the drums spoke to him a message that he could not interpret. He moved restlessly in his seat beside the colonel, and watched the faces of the sepoys. They seemed set in their usual impassive calm, but, as their blood stirred to the wild music, an air of subdued elation appeared upon them.

Then the throbbing monotone grew fainter and gradually died away. The makers of the music retired into the background, and the *subadar-major* approached the dais and saluted.

In a sonorous and flowery speech he extolled the virtues of the colonel, who sat back in his chair with a faint smile of satisfaction about his lips; for to him each word came from the heart, and was true. The oration concluded, he rose and made a brief reply of thanks; and again broke out the rolling crescendo of the drums. Again Trelawney's heart contracted with the prescience of evil; his hand fumbled nervously with his sword-hilt, and he found comfort in the rough grip. Into the circle of the fires came a troop of Waziri dancers, and in rushes and curious twisting evolutions they went through their tribal dances; and, above their shrill cries, rose and fell like waves the pulsation of the drums.

When the dance was concluded, a movement at the farther side of the circle of squatting sepoys caught Trelawney's eye.

Across the open space there came, marching erect and stiff, the tall figure of a young Waziri sepoy, dressed in full uniform, with his rifle at the slope. He came unflinching to the dais and saluted, then spoke in a ringing voice.

'*Karnail sāhib*,' he asked deliberately, 'is this a *darbar* of the regiment?'

Colonel Hosking, amazed at the man's sudden appearance, leaned forward in his chair. The adjutant half rose as if to interfere, but the colonel waved him back.

'It is!' answered the colonel quietly. 'If you have any favour to ask, or complaint to be redressed, speak freely. Have I not promised to give ear to all?'

'Then, *karnail sāhib*,' cried the sepoy, 'my '*izzat*' has been taken from me, and my head is bowed in shame. When *Karnail Rice*, *sāhib*

bahadar, took his presence from his children, I was *naik*, and my name was good amongst the *sibis* of the regiment. Then evil came upon me. I was arrested on a false charge by the *subadar-major*, who is an Afridi. Without a hearing, the stripes of *naik*—which were my pride—were taken from me. This is not justice, nor is it the way of the Bhawelpurs. My ears have been filled with tauntings and reproaches, and my 'izzat has been trampled in the dust of my own country.'

'What do you know of this case, Williamson?' the colonel asked the adjutant.

The adjutant stepped forward and saluted. 'This man was insolent, and spoke in the ranks on parade, sir. The *subadar-major* reported the facts to me, and I reprimanded him. He wished to give up his stripes, and I agreed to his doing so. The Waziri companies are out of hand, sir, and this man is the ringleader in all their devilry.'

With a surge of sudden anger Trelawney stepped forward. 'Excuse me, sir,' he said in deliberate tones, and his voice sounded cold and hard. 'This man was one of the best sepoy in the Waziri companies, and the best shot in the regiment. Until a week ago there has never, to my knowledge, been a complaint against him.'

'That's all very well,' said the colonel sharply; 'but the adjutant has inquired into the case, and finds the man guilty—discipline must be maintained.'

The sepoy waited patiently, glancing from face to face. There began again the insistent throbbing of the drums. Trelawney, watching closely, saw the light of strange fires burn and glow in the depths of the man's dark eyes—and he wondered.

'The evidence was perfectly straightforward, sir,' said the adjutant, with an angry glance at Trelawney. 'The *subadar-major* tells me that this man is the cause of a lot of mischief and dissent in the lines. I suggest, sir, that the appeal be dismissed.'

The talk had been in English until, in the last sentence, Roberts-Williamson used the vernacular for the sepoy's benefit.

They were the last words that the adjutant ever spoke. With startling suddenness, the sepoy dropped his rifle to his hip and sent a bullet crashing into his officer's heart. Uttering a shrill scream of fierce exultation, the Waziri turned and ran swiftly for the foothills.

The echoes of the shot reverberated and died away, and there fell upon the assembly an agonised silence, so tense and so deep that the throbbing of the drums seemed to be a part of it. The adjutant lay still in the dust, his scarlet tunic dark with the deeper red of his life-blood. On all the faces was frozen an expression of grim horror. The sepoy ran, unhindered, screaming his rage at the shame which he had bloodily avenged.

VI.

Trelawney was the first to recover, and he started in pursuit, calling upon the murderer, in Pushtu, to surrender. But the sepoy had a good start, and knowing that death was the price of his deed, resolved, in the manner of his race, to meet it fighting. As he ran he ripped off bayonet and scabbard, and thereby renounced his allegiance to the *sirkar*.

The soldiers, jostling each other aimlessly like frightened sheep, hindered Trelawney's passage, and when he burst through them the sepoy had reached a tall mound, surmounted by a black rock. There was no cover for many yards; and knowing that the man would wipe out his wrongs in blood, as is the fashion of the Waziris, Trelawney stopped, and waited for the coming of the armed party which had started in pursuit of the fugitive.

A *hāvāldar* snatched a rifle from a sepoy and ran towards the hillock. When within two hundred yards, he dropped on one knee and fired. The murderer, from behind the rock, fired almost simultaneously, and the *hāvāldar* dropped, with a bullet through his chest. Trelawney ordered the pursuing party to halt and lie down, for the open space before the mound, utterly bare of cover, was a death-trap. They opened up a scattering fire, which was utterly useless, since the Waziri has nought to learn of the art of taking cover. Trelawney commanded a *jemadār* and six men to encircle the mound and take the murderer in the rear. He, seeing that his hour was at hand, began to chant his death-song.

'Brothers,' he cried aloud, that all might hear, 'you know that the new *kamān afsar sāhib* has worked great wrongs upon the men of the Bhawelpurs, and our 'izzat has been taken from us. With shame in my heart, and the beating of the drums in my ears, I have been this day the avenger of my comrades. The *ajitan sāhib* I have slain because he has oppressed us Waziris beyond endurance, and therefore there is a great gladness in my heart. Presently I shall die; but if there be men amongst you, see that the *karnail sāhib* dies with me. This do for the 'izzat of the regiment.'

The colonel, who was standing at Trelawney's elbow, turned suddenly gray, and his face was the face of an old man; for the eyes of his men were upon him, and not upon the slayer.

'Men of the Bhawelpurs,' he cried, 'follow me, and we will take this murderer alive!'

But no man stirred, for the words of the sepoy were the words of one who stands in the shadow of death, and then the truth is spoken. In the silence, Colonel Hosking saw what he had done, and for a moment, in shame and remorse, he lost his head. Crying aloud that there was mutiny, he half drew his sword.

Trelawney reached out swiftly and thrust it back into the scabbard. 'Too late! Too late!' he said savagely. Then, turning, he spoke winged

words to the regiment. The bitterness that had been in his heart for many days gave him a strange power, and he played upon the feelings of his hearers as upon an instrument. He spoke of the 'izzat of the Bhawelpurs, and how the deed of that day would bring upon them the just scorn of the whole Indian Army. He touched the right chord; from their lips came a low murmur as of waves upon the beach, and to Trelawney came the knowledge that he had them in hand again, that the Bhawelpurs were a regiment once more.

He ceased. Colonel Hosking stood a little apart, his head bowed, his shoulders bent under his burden of shame.

Trelawney touched him lightly upon the arm. 'There is no mutiny, sir,' he said, and his eyes were hard and unsympathetic. 'The murderer will be arrested—but you must leave the regiment; you have heard the truth from the lips of one of your own men, and you know that it is the truth. The men know it also. Your career as a soldier is finished, sir!'

The colonel raised a tragic face to his and looked him full in the eyes; then he smiled—a little, twisted smile. 'It is true, Trelawney,' he said gently. 'It is finished. Without my 'izzat I am better dead.'

He turned and walked steadily towards the mound, his eyes turning neither to left nor to right, and his hands hanging empty at his side.

Trelawney quickly called for a storming-party,

and twenty men followed him. The murderer rose to his feet, aimed deliberately, and fired. Colonel Hosking stopped, and began to sway lightly backwards and forwards; then suddenly his legs crumbled beneath him, and he fell face downwards in the dust, a bullet in his brain.

Trelawney shouted orders to take the sepoy alive. The Waziri, standing erect and shouting defiance, began to empty his magazine rapidly, and in a moment four of the party lay cursing on the ground. When but one shot remained to him, he raised his rifle to his head, hesitated, then dropped it again to his shoulder and added yet another of his kin to the toll of his slaying.

The next moment Trelawney had his arms about the rebel, and the pair were rocking in a grim struggle. By a cunning twist the Waziri threw his officer, and as he fell plucked out his sword. Before the major could regain his feet, the sepoy placed the naked blade to his own breast and fell upon it heavily, so that the point protruded from between his shoulder-blades.

He lay, face downwards, heaving convulsively; then slowly he turned his head and looked up at the major, and from his blood-frothing lips came words. '*Huzūr*, it is fitting; my 'izzat is avenged!' and the life within him flickered and went out.

Trelawney stood and gazed on the dead face, set calm and serene in its long sleep. 'The 'izzat of the regiment is safe also,' he said softly. 'But, my God! the cost—the cost!'

ORCHID-COLLECTING IN BURMA.

By F. NICOLLS.

COMPARED with what took place in the nineteenth century, orchid-collecting in Burma seems to have gone somewhat out of fashion. In Burma, as in most tropical countries, orchids are chiefly epiphytal; that is, they grow upon forest trees apparently without deriving any nourishment from them, but taking advantage of their shade and of the dew or the rain which falls on them. The bulbs and the swellings on orchid-stems doubtless provide the plants with storage-places for water and such nutritive materials as they require.

At certain stages of their lives orchids seem able to live without air, and, packed in coconut fibre in deal boxes, to travel safely in the hold of a steamer during a voyage from the tropics to Europe. In the 'sixties of last century I was acquainted with a chaplain, a head of the commissariat department, and a commissioner in a town in Burma, all keen orchid-collectors, who had a staff of paid foresters in their employment to bring in specimens from remote places, and who annually added to their income several hundred pounds sterling from orchid-collecting. The number of orchid species is said to amount

to at least 5000, and though orchid-collecting never attained to the height of the 'tulipomania' of the seventeenth century, enormous prices were paid by wealthy British collectors for a new species. Hence there was always a keen search going on for fresh varieties, and if one came to hand extra men would be employed, and hundreds, if not thousands, of specimens would soon be brought in.

Those were times when jungle folk in Burma were very primitive and ignorant. They still collect and bring in orchids to be disposed of at the seaports; but they require now to be paid therefor in current coin of the realm, whereas formerly they would think themselves well rewarded if they obtained a couple of empty beer-bottles, or some discarded jam or sardine tins.

The three collectors I mentioned above would, were they now alive, find a very different state of things prevailing from the days when their names were given to new varieties which their collectors were the first to discover. In the case of such orchids, I believe, £100 apiece was often given for the first specimens that arrived in England. These species could now be had

in any number for perhaps a shilling a plant in Burma, and at a not very much higher price, probably, in England itself.

To the lover of nature and beautiful scenery orchid-collecting in Burma, and in the Shan States adjoining it, affords a delightful and fascinating occupation—even if there is no longer the additional attraction of making money by it, or of getting your name immortalised by having some newly discovered variety called after you. The country where orchids flourish offers to naturalists and sportsmen some of the most charming and interesting scenery in the world. The land is tropical and the sun is hot, but there is welcome shade in the forests, and the people generally are amongst the most good-natured, cheerful, and hospitable to be found in any part of the world. There are usually hills from 4000 to 5000 feet high within a day's march, where, however warm the day may have been, one is glad of a roaring fire in camp at night, and at least a couple of blankets in one's bed.

In the early morning a stroll with a gun will often enable one to get a varied bag in which jungle fowl, partridge, duck, pigeon, and sometimes a peacock may figure. Big game is scarce, although the Burmese say that where there are peacocks there are tigers. Tigers are not unknown in the Shan States, but are rarely met with. Bears are sometimes seen on the higher hills, and wild elephants are stated in some parts to do considerable damage to village plantations of rice and sugar-cane. But if you are after big game you require beaters and preparation, whereas you are almost certain to secure a meal any morning in an hour's walk in any direction you choose to take. In few other countries that I have seen or read of is bird-life of every kind so numerous.

The southern Shan States are also famous for

their orchids and wild flowers of every species, both on the ground and on forest trees. The rivers and the streams abound with fish, though they seem too wary to be caught with rod and line. Any one who is a lover of nature and interested in exploration should, if he can spare the time and the money, pay this little-known country a visit. A railway from Rangoon now enables the traveller to reach Kalaw, a charming station in the southern Shan States, where pine-trees grow and a cool climate is experienced throughout the year.

For many years now the northern Shan States have had a railway, and Maymyo, the summer capital of the Burma Government, is reached in a few hours from Mandalay, and in a day from Rangoon, by rail. But to enjoy a trip to the Shan States one should travel away from railways and civilisation, and see a delightful country and people in their primitive simplicity. Travelling in Burma is undoubtedly made more pleasant and cheerful by reason of the fact that the people are Buddhists and have no caste prejudices against associating with those of any nationality who treat them properly and do not put on 'side.' You feel this as you enter any house, however humble it may be. You are received with a cheerful smile, and the best of everything the owners possess is placed at your service as long as you are an inmate. Everywhere you find a marked difference from the exclusiveness shown in India to European travellers. This agreeable change may be attributed to the humane and tolerant principles inculcated by Gautama over twenty-four centuries ago. There is no zenana system amongst Buddhists as in Mohammedan countries. The women are as free as the men, and are treated not as slaves when they marry, but as comrades of equal standing and influence with the men.

THE PARTS MEN PLAY.

CHAPTER III.—ABOUT A TOWN HOUSE.

I.

IT was perhaps not inconsistent with the character of Lady Durwent that, although she had striven to secure the guiding of Malcolm's development, she should find herself totally devoid of any plan for the training of a daughter.

Vaguely—and in this she mirrored thousands of other mothers—there was a hope in her heart that Elise would grow up pretty, virtuous, amiable, and would eventually marry well. It did not concern her that the girl was permeated with individuality, that the temperament of an artist lay behind the changing eyes in that restless, graceful figure. She could not see that her daughter had a delicate, wilful personality,

which would rebel increasingly against the monotony of a social régime that planned the careers of its sons before they were born, and offered its daughters a mere incoherency of good intentions.

Full of the swift imaginativeness which makes the feminine contribution to life so much a thing of charm and colour, Elise pursued the paths which Youth has for its own—those wonderful streets of fantasy that end with adolescence in Society's ugly fields of sign-posts.

Lacking the companionship of others of a similar age, she wove her own conception of life, and dreamed of a world actuated by quick and generous emotions. She pictured love that would irradiate the gloom of everyday existence and make the night a thing of soft music and

Orient-shaded lights. With every pulsing beat of the warm blood coursing through her veins she demanded in her girl's mind that the world in which her many-sided self had been placed should yield the wines to satisfy the subtle shades of thirst produced by her insistent individuality.

And the world offered her sign-posts.

This must you do and thus must you talk; hither shall you go and here remain: these are the Arts with which you may enjoy a very slight acquaintance, but do not aspire to genuine accomplishment—leave that to common people; be lady-like, be calm and reserved; behold your brothers, how they swank!—but they are men and this is England; desire nought but the protected privileges of your class, and in good season some youth of the same social stratum as yourself will marry you, and, lo! in place of being a daughter in a landed gentleman's house, you will be a wife.

Into this little world of a kind-hearted, chivalrous aristocracy (whose greatest fault was their ignorance of the fact that the smallest upheaval in humanitarianism, no matter what distance away, registers on the seismograph of human destiny the world over) Elise Durwent found her path laid. Increasingly resentful, she trod it until she was fourteen years of age, when her mother, who had long been bored with country life, made an important decision—and purchased a town house.

Having done this, Lady Durwent sent her daughter to a convent, a move which enabled her to get rid of the governess discreetly, and left her without family cares at all, as both boys were now at Eton. Unencumbered, therefore, she said *au revoir* to Roselawn, and set her compass for No. 8 Chelmsford Gardens, London.

II.

Chelmsford Gardens is a row of dignified houses on Oxford Street—yet not on Oxford Street. A miniature park, some forty feet in depth, acts as a buffer-state between the street itself and the little group of town houses. It is an oasis in the great plains of London's dingy dwelling-places, a spot where the owners are rarely seen unless the season is at its height, when gaily cloaked women and stiff-bosomed men emerge at theatre-hour and are driven to the opera. Throughout the day the Gardens (probably so styled on account of the complete absence of horticultural embellishments) are as silent as the tomb; there is no sign of life except in the mornings, when a solemn butler or a uniformed parlour-maid appears for a moment at the door like some creature of the sea coming up for air, then unobtrusively retires.

No. 8 was exactly like its neighbours, consisting of an exterior boasting a huge oak door, with cold, stone steps leading up to it, and an interior composed of rooms with very high ceilings, an

insufficient and uncomfortable supply of furniture, large pictures and small grates, terrific beds and meagre chairs, and a general air of so much marble and bare floor that one could almost imagine that house-cleaning could be accomplished by turning on the hose.

After Lady Durwent had taken possession she sent for her husband, but that gentleman reminded her that he was much happier at Roselawn, though he would be glad if she would keep a room for him when business at the 'House' or with his lawyers necessitated his presence in town. Unhindered, therefore, by a husband, Lady Durwent prepared to invade London Society, only to receive a shock at the very opening of the campaign.

The Ironmonger had preceded her!

It is one of the tragedies of the *élite* that even peers are not equal. The law of class distinction, that amazing doctrine of timidity, penetrated even the oak door of 8 Chelmsford Gardens. The Ironmonger's daughter found that being the daughter of a man who had made an honest living rendered her socially the unequal of the daughters of men who, acting on a free translation of 'The earth is the Lord's,' had done nothing but inherit unearned substance.

Then there was her cheerfulness, and the menacing voice!

Turning from the aloofness of the exclusive, Lady Durwent thought of taking in famous performing Lions and feeding them. Unfortunately the market was too brisk, and the only Lion she could get was an Italian tenor from Covent Garden, who refused to roar, but left a poignant memory of garlic.

It was then that a brilliant idea entered her brain. Lady Durwent decided to cultivate *unusual* people.

No longer would she batter at oak doors that refused to open; no more would she dangle morsels of food in front of overfed Lions. She would create a little Kingdom of remarkable people—not those acclaimed great by the mealy mob, but those whose genius was of so rare and subtle a growth that ordinary eyes could not detect it at all. Her only fear was that she might be unable to discover a sufficient number to create a really satisfactory *clientèle*.

But she reckoned without her London.

For every composer in the Metropolis who is trying to translate the music of the spheres, there are a dozen who can only voice the discordant jumble of their minds or ask the world to listen to the hollow echo of their creative vacuum. For every artist striving to catch some beauty of nature that he may revisualise it on canvas, there are a score whose eyes can only cling to the malformation of existence. For every writer toiling in the quiet hours to touch some poor, dumb heart-strings, or to open unseeing eyes to the joy of life, there are so many whose gaze is never lifted from the gutter, so that when they

write, it is of the slime and the filth that they have smelt, crying to the world that the blue of the skies and the beauty of a rose are things engendered of sentimental minds unable to see the real, the vital things of life.

To this community of *poseurs* Lady Durwent jingled her town house and her title—and the response was instantaneous. She became the hostess of a series of dinner-parties which gradually made her the subject of paragraphs in the chatty columns of the press, and of whole chapters in the gossip of London's refined circles.

Her natural cheerfulness expanded like a sunflower, and when her son Malcolm secured a commission in the —th Hussars, her triumph was complete. Even the staggering news that Dick had been taken away from Eton to avoid expulsion for drunkenness proved only a momentary cloud on the broad horizon of her contentment.

When she was nineteen years of age Elise came to live with her mother, and as the fiery beauty of the child had mellowed into a sort of smouldering charm that owed something to the mystic atmosphere of convent life, Lady Durwent felt that an ally of importance had entered the arena.

Thus four years passed, and in 1913 (had peeresses been in the habit of taking inventories)

Lady Durwent could have issued a statement somewhat as follows:

ASSETS.

- 1 Husband; a Peer.
- 1 Son; aged twenty-five; decently popular with his regiment.
- 1 Daughter; marriageable; age twenty-three.
- 1 Town House.
- 1 Country Estate.
- The goodwill of numerous *unusual* people, and the envy of a lot of minor Peeresses.

LIABILITIES.

- 1 Son; aged twenty; at Cambridge; in perpetual trouble, and would have been rusticated ere now had he not been the son of a lord.
- 1 Ironmonger.

'My dear,' said Lady Durwent, glancing at her daughter, who was reading a novel, 'hadn't you better go and dress?'

'Is there a dinner-party to-night?' asked the girl without looking up.

'Of course, Elise. Have you forgotten that Mr Selwyn of New York will be here?'

'Is he as tedious as Stackton Duncleley?'

Lady Durwent frowned with vexation. 'My dear,' she said, 'you are very trying.'

THE EXPLOITS OF LIEUTENANT-COLONEL 'KLONDIKE' BOYLE.

By DOUGLAS WATSON.

PART I.

I.

SOME time ago a humorous weekly published a drawing of an inebriated gentleman in a hotel surveying a huge fish enclosed in a glass case. 'The man that caught tha' fish,' the 'i.g.' was saying after deep thought, 'is (hic) a liar.'

In writing of Joe Boyle, otherwise known as 'Klondike' Boyle—since the war Lieutenant-Colonel Boyle, wearing the Stanislaus, 4th class; the Vladimir, 4th class; the Order of Queen Anne with swords (all Russian decorations); the Order of the Crown of Rumania, the Star of Rumania and Grand Cross, and the Regina Maria, 1st class; a gentleman listed in the Rumanian Peerage as the Duke of Jassy—my only worry is in wondering how much of the truth I can write before the readers of *Chambers's Journal* charge me with invention.

As a matter of fact, Boyle's career is more extraordinary than any ever conceived by the vigorous pen of Jack London. With all his adroit genius for creating heroes of romance, Dumas never pictured a more engaging figure than this Canadian. In London, Petrograd,

and Paris, 'Klondike' Boyle is known as one of Europe's first gentlemen of adventure.

Without the least exaggeration it can be said of this native of Ontario that he juggled statesmen, diplomats, and generals as other men play with dice. In the tragi-comedy of Bolshevism he wandered on and off the stage at will, directing and changing the course of events by sheer force of a personality that could be felt even through the medium of an interpreter.

He is a man who has lived in the open, and has assimilated something of the vastness of nature's broad expanse. When I met him in the 'Ritz' in London, surrounded by Rumanian Staff officers, there was still an air of the North about his thick-set figure, with its powerful face and shaggy light-brown hair. He does not talk glibly; therefore, when he speaks, one listens.

'Colonel Boyle,' said the Queen of Rumania when she visited London, 'is Rumania's friend. Our country owes him a debt we never can repay.'

So much for so much, This is the true story of the exploits of 'Klondike' Boyle.

II.

Boyle was born in Woodstock, Ontario, the son of an Irishman who had settled in Canada many years ago. He is related to the Earl of Cork, and is devoted to the Empire—although possessed of his race's natural love for 'alarums and excursions.'

His first bid for fame was to start for the Klondike in 1897 as manager for a heavy-weight prize-fighter. Unfortunately for the completeness of this narrative, the name of the pugilist is unknown; but it can be assumed that he was knocked out, either by an adversary or by adversity, for his manager appears to have left him shortly after their arrival. At any rate, it was not in the nature of things that Boyle should remain a fighter's Boswell—one could as readily conceive of Lord Beaverbrook devoting his life to chronicling the activities of Ramsay Macdonald.

In the rush of '98 Boyle staked an eight-mile claim, subsequently selling it for a large sum. Now, if this were fiction the story would end here—any author knows that when his hero makes a million in the Klondike, his story is over. Give him a pretty wife, describe a sunset—and *voilà! C'est fini.*

Not so this adventurer of the North. Having achieved money, he started out to see what life held for him. He became heavily interested in railroads, in dredging, and invested money in various enterprises of Dawson City. In a short time he had ceased to be an individual, and had become one of the Yukon's sights of interest. It is not easy to dominate a mining-country, for the lure of gold draws men of jaw and character—but Boyle had both, and imagination besides. By common consent he was given the sobriquet of 'Klondike' Boyle, and his fame began to spread from Vancouver to New York. Probably the only place that hadn't heard of him as the 'Klondike King' was Woodstock, Ontario.

When the war broke out, Boyle gathered together two hundred choice spirits, called them 'The Yukon Pack Company,' took them to England at his own expense, and offered them to the British Government. Afterwards, as part of the Yukon Machine-Gun Battery, they did gallant work in France.

Some day, it is to be hoped, the full history of that little band will be written. It recalls old times described in Conan Doyle's *White Company*, when English knights used to raise bands of men, and crossing the Channel, waged chivalrous warfare upon the French, with much glory to themselves and their ladies' eyebrows.

But there is one difference—adventurous spirits as they were, the Yukon men went for a great cause; and to-night, in the wind-swept fields of Flanders, many of them are at rest. Is there any one whose imagination is so dead that there is not for him something gripping in the thought of those men of the North, who had

once wrestled with the earth for her riches, now lying asleep in her forgiving bosom?

III.

Possibly if Boyle had gone to France he would never have been heard of again; but the military authorities, in one of those flashes of intelligence which sometimes illuminate officialdom, decided that he should be sent with the Canadian Transport Mission to Russia. And that was the real beginning of the romance of 'Klondike' Boyle.

It was in June 1917, after consultation with the Russian General Staff, that he was sent to the south-western front to examine and report on the condition of their light-railway and horse-transport system. He took along with him the official interpreter of the General Staff, and had just completed six weeks' work when, on his way back to Stafka, there was a break in the line at Tarnopol. This struck Boyle as something which needed attention, so he entered the place to investigate. Things were in a 'pretty kettle of fish.' The officer commanding had be-thought himself and gone, the inhabitants were passing from a state of confusion to one of riot, and the enemy was preparing to exploit the situation.

'Assuming an authority I did not possess,' Boyle subsequently wrote in a charmingly naïve report, 'and with the assistance of two young Russian officers, I got a Russian Death Battalion (women) to throw a cordon round the town, and establish patrols, and restore some semblance of order.'

Having done that, Boyle stayed around for a day, during which time the place was twice attacked from the air, and feeling that everything was fairly satisfactory, proceeded on his way.

The incident needs no comment. D'Artagnan could not have done more.

After reaching Stafka, he was asked to attend a conference with the Government at Petrograd. He did so, made his report, and had the satisfaction of seeing his recommendations accepted in their entirety.

For the sake of space, as I want to write of his more spectacular exploits, it is necessary to pass over his work of the next few months. It is sufficient to note that he began to interest himself in Rumanian as well as Russian transportation, being furnished with a special train or a destroyer whenever he wished one. At that time Russia had about a million men in Rumania, and had not shifted a pound of flour for some weeks, whereas the army was eating a bread ration of two pounds a day per head. The Rumanian wheat was disappearing fast, and experts estimated they would be at the end of their supplies by January 1918.

Enter 'Klondike' Boyle.

He promptly arranged for eight draught

boats for Lake Yalpuh, prepared a system which was subsequently carried out, and for several months five hundred tons of flour per day were delivered from Russia to Rumania.

Having adjusted that trifling matter, the worthy Klondiker then hurried to Stafka and interviewed Kerensky, who, after the Korniloff trouble, had invested himself with the rank of Commander-in-Chief. At the conference with Boyle and Kerensky were General Alexieff and General Doukhonin, who later became the Commander-in-Chief of the Russian forces. Owing to General Alexieff's approval of Boyle's suggestions, the Canadian was placed in complete charge of reorganisation and construction-work on the Bessarabian railways.

At this stage in Boyle's career officialdom decided that he had been a free-lance long enough, and the general who was chief of the British Transport Mission informed him that he was under the Mission for orders. This struck Boyle as absurd, and he protested; but the British Ambassador at Petrograd and the War Office informed him that he was subject to regulations.

It is difficult to harness a hurricane.

Lieutenant-Colonel Boyle tendered his resignation to the Russians, offering first to complete his Bessarabian work, and then steal silently away. The Russians were much perturbed, and invited him to Petrograd to confer with the Minister of War, the Minister of Ways and Communications, and the Minister of Foreign Affairs.

'Gentlemen,' said Boyle, who felt that his knowledge of local affairs made supervision not only irritating, but unnecessary, 'I am tired of working in the position I occupy, not because of any effect it has on my work, but because of constant annoyances from the British and American Transport Missions.'

The matter was adjusted by the 'Stevens' Mission and the British one being kept to the civil area, while the man from Canada was placed in complete charge of the military area.

IV.

After a period of modified calm, punctuated by trying moments, he kept at the work until the Russians signed an armistice. As no one wanted to do any further work after that, Boyle went to Petrograd, and was among those present when the Bolsheviks seized the wheel and started their joy-ride.

To a man with a natural love for moulding chaos, the Bolsheviks offered an enticing prospect for further adventure. There was street-fighting for six days in Moscow, resulting in a freight blockade and a threat of general starvation. The Northern Army was starting for home, amusing itself by destroying estates, burning villages, and, to celebrate the new freedom, massacring peasants *en route*.

Realising that the plot of their drama was becoming somewhat obscured by the enthusiasm of the actors, the Bolsheviks did a wise thing. They took General Maniekouski, Minister of War, from the prison where they had incarcerated him, and, with an aplomb one is forced to admire, replaced him in the War Ministry and told him to feed the army.

'*Tschk!*' said the general. 'Send for Colonel Boyle.'

The general, being a soldier, knew that the military art consists in shoving responsibility on to other people's shoulders. He asked Boyle to go to Moscow and untie the knot; and Boyle, not being a *pucka* soldier, promptly agreed to do so.

Nothing daunted by the news from that city, he entered its bullet-harassed streets. In forty-eight hours freight was moving out of Moscow; and in a week things were running fairly smoothly.

How did he do it? It is difficult to state, but presumably even a Bolshevik stands aside for a man who knows where he is going. What a pity the Allies at large did not realise that elemental bit of psychology!

In case time hung heavy on his hands, Boyle was then placed in charge of the protocol between Russia and Rumania for both food and clothing. Up to that time Russia had delivered only promises. The Wizard of the Klondike waved his wand, and in eight weeks more than two-thirds of the promised goods were delivered. Some idea of the magnitude of this achievement may be gathered when it is realised that the protocol covered equipment for 350,000 men.

Having performed this herculean task, Boyle was just taking a breather, and wondering whose stables would have to be cleaned out next, when he was visited by the much-perturbed Rumanian Consul-General at Moscow. That official had received orders that he was to send to Rumania the archives of the Foreign Office, which had been deposited in Moscow when the evacuation of Rumania was contemplated; and also he was to send all the Rumanian paper money that was being printed there.

The proposition was a difficult one, as the load weighed twenty tons, and it was necessary to pass through the lines of the Bolsheviks and the Ukrainians, who were fighting. It was at this stage that Boyle's admiration of Rumania took definite and permanent form. As an ex-manager of a heavy-weight prize-fighter, he had felt for a long time that Rumania was a game little bantam, trying to hold her own in a ring crowded with heavy-weights. From what he could gather, she was getting the worst of it from friend and foe alike, so he decided to lend our little Ally a helping hand.

Having almost absolute authority on the railroads, he took charge of the archives and a vast sum of money, and after twice passing through the lines where the Bolsheviks and the Ukrainians

were at war, he reached Jassy in safety. After that he returned to Russia, and continued his work as chairman of the All Russian Food Board, which had been formed in November 1917.

It was during this period that Boyle paid a visit to Antonof, the leader of the Bolsheviks against the Cossacks, to ascertain the exact state of mind of that evil-reputationed general in case the Germans advanced. To the Canadian's surprise, he found the Russian an excellent leader and decidedly anti-German. Boyle and he had a most amiable meeting, and on parting swore eternal hatred of Germany. And history records that as long as his men held together Antonof never went back on his oath of war on the Hun.

Armed with Antonof's authority, Boyle then proceeded to Sebastopol. As his train arrived it was surrounded by a Bolshevik leader named Speiro and a committee of sailors.

'What does this mean?' demanded Colonel Boyle.

Speiro explained that a local newspaper had just announced that Britain had made peace with Turkey; the British Fleet had entered Constantinople, and was about to invade the Black Sea for the purpose of crushing the Black Sea Fleet, as a punishment for the Bolsheviks making war on Rumania. Therefore a resolution had been passed to arrest all Allied subjects, so that for every sailor of theirs killed they might execute ten Allied prisoners. They implied that Boyle would make a pleasant addition to their list.

Summoning his interpreter, Boyle addressed

them in a very few words, but with plenty of emphasis. He explained that the whole thing was untrue, that the newspaper was owned by German propagandists, and he called for volunteers to go and demolish the said newspaper.

This appealed to the mob as an idea of considerable originality, so they adjourned to the newspaper-office, arrested nineteen members of the staff, and then wrecked the place.

At the invitation of the committee, Boyle waited until next day, when large meetings took place. Speiro referred to Britain as Russia's best friend (this being received with wild applause). Later Boyle attended a meeting of all the committees of the Black Sea Fleet, and through an interpreter (Captain G. A. Hill of the 4th Manchesters) he explained that Britain never forsook her friends, that she did not want to interfere with Russian politics, but merely wished to stop Russians from killing each other, so that they could devote their energies to the much nobler task of killing Germans.

'The Huns,' he said, 'are sure to advance into your country for the purpose of making you more their slaves than you have ever been before.'

This caused a furore of appreciation, and the appearance of a British naval officer in uniform was a signal for wild applause.

The episode is not lacking in humour, but it turned the whole Black Sea Fleet solidly pro-Ally at the very moment when it seemed to be assuming an attitude of friendship towards Germany.

(Continued on page 56.)

GERMANY'S STORY IN STAMPS.

By DOUGLAS B. ARMSTRONG.

THE advent of the first postage-stamps commemorative of the German Republic, in designs symbolical of the rebirth of the Teutonic nation, marks the latest phase in Germany's history as exemplified in postal issues. The history of modern Europe and of the events which led up to the world war of 1914-18 are vividly recorded in the pages of the stamp-album, wherein may be traced the rise and the fall of the German Empire, and its disastrous bid for world domination. The story of Prussian aggression is brought home to the stamp-collector in no uncertain manner through the medium of his chosen hobby, the political developments being marked, almost without exception, by corresponding changes in the stamps of the affected countries.

The year 1849, which witnessed the general endorsement of the convenience of the postage-stamp by the nations of Europe, found Germany a loosely knit group of petty states, of which the most powerful was Prussia; France was once

more a republic, following upon the abdication of Louis-Philippe; Leopold I. of Saxe-Coburg occupied the throne of the now independent Belgium, whose neutrality was guaranteed by the Great Powers. At that time Bavaria alone amongst the German states had issued adhesive postage-stamps, but in 1850-51 she was joined by Baden, Hanover, Prussia, Saxony, and Württemberg. The early stamp issues of these states include a number of outstanding philatelic rarities, and are still much sought after by stamp-collectors the world over.

In 1880 a German-Austrian Postal Union was established, which was joined by a number of German states. The Baden, Thurn and Taxis, and Württemberg stamps of the period bore the inscription, '*Deutsch-Oestr. Postverein.*'

In 1864 Prussia and Austria together made war on Denmark, wresting from her the duchies of Schleswig and Holstein, which event was signalled by the issue in the following year of special stamps under the joint administra-

tion of the two allies. Subsequently the provinces were divided, Austria taking Holstein and Prussia Schleswig; and this partition was marked by the appearance of two distinct series of postage-stamps, one for each province.

A dispute over the division of the spoils led to the Austro-Prussian war of 1866, when several of the German states threw in their lot with Austria. Military postmarks employed in this campaign, culminating in the defeat of the Austrians at Sadowa, exist on the stamps of the period in use by Austria, Prussia, Bavaria, Württemberg, Saxony, and Hanover. The most important result of the Austro-Prussian war was the welding of the German states lying north of the Main into the North German Confederation. Two years later a general series of postage-stamps for the North German Confederation superseded the individual issues of Prussia, Brunswick, Mecklenburg-Schwerin, Mecklenburg-Strelitz, Oldenburg, Saxony, and Schleswig-Holstein, as well as those of the free Hanseatic towns of Hamburg, Lübeck, and Bremen. The stamps of the North German Confederation were supplied in two currencies, 'groschen' for the northern district, and 'kreuzer' for the southern. The kingdoms of Bavaria and Württemberg, and the grand-duchy of Baden, although in alliance with the other states, retained their independence, and continued to issue stamps of their own.

Of the grim struggle between France and Germany in 1870-71 the stamp-collector possesses many striking souvenirs. On the German side, apart from the distinctive cancellations of the field post-offices, special stamps were provided for use by the civil population in the occupied French territory. In design these labels were of the simplest possible description, consisting merely of the word '*Postes*' and a value in 'centimes' superimposed upon a reticulate ground. They were first brought into use on 6th September 1870. By means of dated postmarks on these stamps philatelic students have been enabled to follow the progress of the German armies in their march on Paris. The stamps of the German army of occupation were withdrawn in all districts excepting the conquered provinces of Alsace and Lorraine on 24th March 1871.

On 18th January 1871 the German Empire was proclaimed in the famous Hall of Mirrors at Versailles. Following on this event, a general issue of postage-stamps for the whole of Germany (with the exception of Bavaria and Württemberg) made its début on 1st January 1872, embossed with the device of the Prussian eagle and inscribed '*Deutsche Reichs-Post*.' Württemberg, however, exercised the right to issue its own stamps down to 1st April 1902, and Bavaria to the present day.

An early indication of Germany's foreign policy and the commencement of the celebrated

'*Drang nach Osten*' is afforded by the establishment of a postal agency of the North German Confederation in Constantinople on 1st March 1870, to which distinctive postage-stamps were later supplied.

Germany's colonial aspirations took definite form between the years 1884 and 1888, when the contemporary German postage-stamps began to be used by the post-offices of the newly acquired overseas possessions of the Cameroons, Kaiser Wilhelm's Land, Togoland, and South-West Africa. To these was added in 1890 German East Africa; and about the same time the stamps used in the various colonies were overprinted diagonally with the name of the colony, thus appropriating them to colonial use. The ceding of Heligoland by Great Britain on 9th August 1890 caused the stamps of that islet showing the national arms surmounted by the British crown to be superseded by those emblazoned with the arms of Prussia, first issued in October 1889, a year and more after the accession of Kaiser Wilhelm II.

In 1897 the German 'mailed fist' made itself felt in the Far East by the dramatic seizure of the port of Kiauchau on the Shantung Peninsula. Simultaneously the current German postage-stamps were issued there, overprinted diagonally with the single word 'China.'

The year 1899 saw the German flag carried into the Pacific; the appearance of German stamps overprinted 'Samoa' signalled the annexation of the 'Pearl of the South Seas.' About the same period Germany entered the field of Moroccan politics as a rival of France, German postal agencies being opened in a number of Moorish towns on 20th December 1899 as an adjunct to commercial and political penetration.

The German militarist movement which culminated in the final bid for world supremacy may be said to have originated about the time of the British reverses in South Africa. In the stamp-album it is marked by the introduction, early in 1900, of patriotic postage-stamps, the low values of which were adorned with a mail-clad figure of the titular deity 'Germania,' grasping a sword-hilt. The inspiration of this martial design is commonly attributed to the ex-Kaiser himself, who was so strongly impressed by the dramatic portrayal of this character by Fraülein Anna Führung of the Imperial Opera that he commanded her likeness to be presented upon the national stamps. Another patriotic design figures on the two marks value of the same series, which was taken from an allegorical painting by Anton von Werner, typifying the union of North and South Germany, which is described as follows: 'The two factions are represented by two warrior heroes of ancient Germany, clasping hands and burying the old ill-will of the race. In the background at the left are seen the Alps, with

the Rhine at their base; and likewise at the right is the Baltic Sea, with the cliffs of the island of Rügen, the limits of the German Fatherland; whilst above the reunion of North and South hovers the goddess of Victory, holding aloft the Imperial Crown, which sheds its lustre over all. At the bottom is the legend, "*Seid Einig, Einig, Einig!*" ("Be united, united, united!")'

The unveiling of the magnificent Kaiser Wilhelm I. memorial in Berlin forms the subject of the design of the three marks value (after the painting by W. Pape); whilst the same artist's picture of Wilhelm II. delivering an address to the Reichstag on the anniversary of the constitution of the German Empire is shown on the highest denomination, five marks. The War Lord is depicted surrounded by his staff and representatives of the Imperial Government, grasping in his hand the standard of the 1st Regiment of Guards, in the act of concluding his oration with the words '*Ein Reich, Ein Volk, Ein Gott*' ('One Empire, one People, one God').

Coincident with the appearance of these national postage-stamps, a general type of stamp was adopted for the German colonies, bearing a representation of the Imperial yacht *Hohen-*

zollern. This design was chosen as emblematic of the newly founded German Navy League, for the *Hohenzollern*, although used as a royal yacht, was in reality an armoured cruiser, owing to the fact that the Reichstag declined to vote money for the construction of a purely pleasure-craft.

The outbreak of the world war and the violation of Belgian neutrality are perpetuated for all time in the sinister Gothic overprint 'Belgien' imposed upon the German stamps issued under the Imperial Governor-Generalship. Later issues, with the name omitted, but surcharged with new values in 'centimes' and 'francs,' were also employed in northern France during the German occupation. Similar overprints marked the temporary military successes in Poland, Russia, and Rumania.

The passing of the German colonies and the beginning of the end are betokened by the overprinting of the former German colonial stamps in Samoa, New Guinea, Togoland, Cameroons, East Africa, &c., under Allied administration, and the break-up of the German Empire is proclaimed by the addition of the legends '*Volksstaat Württemberg*' and '*Freistaat Bayern*' to the stamps issued under the Revolutionary Governments of those erstwhile kingdoms.

THE FATE OF OLD MANUSCRIPTS.

By Rev. N. FARQUHAR ORR, B.A., B.D.

OF those literary treasures which classical authors bequeathed to the world, only a small portion have been preserved. Time, spite, and ignorance have contrived for us, the heirs, an irreparable loss; and if it be asked how this has happened, it can be replied, 'The character of the destroyer suits equally well the bigot, the blockhead, and the barbarian.' How great is the loss may be surmised when we recollect that Livy's *History* originally consisted of one hundred and forty-two books, of which but thirty-five remain. Of the twelve books of Tacitus's *Histories* there are only four extant. Chance has saved for us nineteen out of the eighty or ninety dramas of Euripides. Plautus is credited with one hundred and thirty comedies, and of these one hundred and ten have been lost. The same fate has overtaken the autographs of the Bible; and we are dependent in some instances upon manuscripts prepared many centuries after the books were first written. Nor has fortune been much kinder in the case of the writings of certain modern authors. Louis XIV. destroyed with his own hands works of Fénelon. The letters of Lady Mary Wortley Montagu were burned by her mother, though her Turkish correspondence was saved. Some valuable family manuscripts belonging to the Duke of Bridgewater were also destroyed by fire because, it is reported, he wished to conceal his descent from mean antecedents.

Of all the wealth of literature, far more has perished than industrious research is ever likely to recover. Yet, much as we regret the loss of so many works of genius, we are at the same time provided with the very interesting story which attaches to their fate. The splendid library at Alexandria was destroyed by religious fanaticism, both Christian and Mohammedan. Four thousand manuscripts (so the story goes) were used for heating the stoves by the master of the baths in the time of Caliph Omar. At Granada Ximenes burned five thousand Korans. Twelve thousand copies of the Talmud perished in the flames at Cremona. The Persians destroyed the literature of Phœnicia and Egypt, the Jesuits that of Bohemia. Many manuscripts in the quaint Peruvian picture-writing were lost for ever owing to the bigotry of Roman Catholic priests. The brilliant writings of Origen were burned by the orthodox. The ancient learning of the Irish monasteries suffered at the hands of invaders. And the ruin of what escaped the malice of man was completed by the not less certain process of decay. Part of our impoverishment is due to neglect. In his *Monasteries in the Levant* Curzon draws a pathetic picture of the fate which overtook the manuscripts stored in the monastery of Pantocratoras. He was told that he would find all that was left of the library in the great square tower. 'I went to look at the place, and leaning

through a ruined arch, I looked down into the lower storey of the tower, and there I saw the melancholy remains of a once famous library. By the dim light which streamed through the opening of an iron door in the wall of the ruined tower, I saw above one hundred ancient manuscripts lying among the rubbish which had fallen from the upper floor, which was ruinous, and had in great part given way.' He rescued at great risk to himself one or two folios from the heap, but found that the rain had washed the outer covers quite clean, while the rest of the books were glued into a solid mass by the damp. In another monastery he found valuable manuscripts being used as covers for large pots containing preserves. Sometimes the loss of manuscripts has been brought about by a misfortune which no care could have foreseen or provided against. Such was the case with Hudde, a rich burgomaster of Middelburg. For thirty years he had travelled through China gathering many literary treasures. Having mastered the language and made a collection of singular importance, he was unfortunately shipwrecked on his way home, and the library thus laboriously acquired was lost for ever. The same unhappy fate overtook Guarino Veronese after he had searched Greece for literary spoils. As he was returning to Italy richly laden he was wrecked, and all his treasures found a grave in the deep. The loss so affected him that it is said his hair turned white. Another great library which filled three vessels was seized on its way to Naples by pirates, who could not be expected to appreciate their prize, and threw every book overboard. In this manner must many priceless cargoes have found their way to the bottom of the sea as they were being carried by conqueror or book-lover from one shore to another.

But the Fates have not always proved hostile. The discovery of lost manuscripts yields just as fascinating a story. By some queer trick of Fortune's hand the bigotry and the neglect of man have often been defied. The same inscrutable chance which has robbed the world of its treasures, after cheating us, has restored a portion. So thought Poggio the Florentine when, from under a heap of rubbish in a decayed coffer in a tower belonging to the monastery of St Gall, he unearthed a copy of Quintilian. The best manuscript of Tacitus was preserved in another monastery in Westphalia. A precious volume was rescued from a printer about to use it to line the covers of his books, another from the hands of a fishmonger, a third from a maker of battledores. An original Magna Carta, with all its seals intact, was spared the ignominious end of being cut up for measures by the scissors of a tailor. For a long time the letters of Cardinal Granvella lay forgotten in a garret, and they were only brought to light when sold to the grocers for waste-paper. The falling of a false ceiling in a chamber

in Lincoln's Inn revealed a vast collection of State papers gathered together by Thurloe, the secretary of Cromwell. Most interesting of all, perhaps, was the discovery that beneath the writing of certain manuscripts there lay the work of an earlier and more important author. Such manuscripts are called *palimpsests*. So scarce was writing material in the Middle Ages, and so durable the parchment of the old manuscripts, that the monks were often tempted to expunge the old writing and use the books again for their breviaries and liturgies. But fortunately they did not in all cases do their work so thoroughly that all traces of the original were lost. After being chemically treated, the palimpsest of Ephraim the Syrian was found to yield an important version of the Scriptures. It is not long since a parchment was discovered at Rome on which part of a book of Livy had first been written and then effaced.

Of recent years most fruitful and surprising results have attended the manuscript-hunter. But it has been mainly in one direction. The monasteries were so thoroughly ransacked by scholars after the great Revival of Learning that very few classical treasures could have escaped their eyes. Until a century ago, however, they still contained many rare and important copies of the Bible. Egypt and Syria then became the centre of a new exploration. The climate, the seclusion of the monasteries, the jealous guard of the monks, contributed to the preservation of many remarkable volumes. In 1837 Curzon paid a visit to the famous monasteries of the Nitrian desert. His object was to ascertain the whereabouts of an oil-cellar in the monastery of Souriani, where he had been told were many manuscripts. On arriving he feigned an interest in the cellar, and asked to be conducted thither. No trace of any book was to be seen. Then he spied a narrow low door, which led him into a small stone vault, where, piled to a depth of two or three feet in a promiscuous heap, lay a number of Syriac manuscripts. Most of the leaves were loose, and the heap, on being disturbed, scattered clouds of pungent dust. Curzon secured four volumes, and the monks brought out another, very large and very heavy. So bulky was this one that Curzon was obliged to leave it behind. The regret which he felt on abandoning it was deepened when he subsequently learnt it was a very important manuscript of the fifth century. The contents of the cellar were afterwards purchased by Dr Tattam in 1842, and sent to the British Museum. Here Mr Cureton, with infinite patience and labour, succeeded in arranging a great many volumes. Altogether the manuscripts, both perfect and imperfect, numbered about a thousand. The labour of sorting out fragments of leaves from some twenty bundles and piecing them together must have been immense. These bundles contained the sweepings from the floor of the room where the manuscripts

had lain for ages. Concerning the chief manuscript of the collection, Cureton writes: 'Among all the curiosities of literature, I know of none more remarkable than the fate of this matchless volume. Written in 411 A.D. in the country which was the birthplace of Abraham, it was at a subsequent period transported to the Valley of the Ascetics in Egypt, probably in 931. In 1839 it was brought from the solitude of the African desert to the most frequented city in the world. Thus, after various fortunes in Asia, Africa, and Europe, it has already survived one thousand four hundred and thirty-six years.'

Egypt has also been the scene of more recent discoveries. There, recently, a new impetus was given to the search for old manuscripts by the unearthing of many interesting documents. From old rubbish-heaps wills, invitations to dinner, homely letters, farming transactions, and the like have been recovered. Occasionally the find has been of great importance. The *Mimes* of Herodas, a little-known Greek writer, is an example, and on examination proves to have an almost modern tone. Mr Whibley in an article (*Nineteenth Century*, 1891) selects one extract, which may be given here:

'There are three *dramatis personæ*—Metriche, a "grass-widow;" Threissa, her maid; and Gyllis, an old lady.

'Metriche. Threissa, there is a knock at the door; go and see if it is a visitor from the country.

'Threissa. Please push the door. Who are you that are afraid to come in?

'Gyllis. All right, you see, I am coming in.

'Threissa. What name shall I say?

'Gyllis. Gyllis, the mother of Philainis. Go indoors, and announce me to Metriche.

'Threissa. A caller, ma'am.

'Metriche. What, Gyllis; dear old Gyllis! Turn the chair round a little, girl. What fate induced you to come and see me, Gyllis? An angel's visit, indeed! Why, I believe it's five months since any one dreamt of your knocking at my door.

'Gyllis. I live such a long way off, and the mud in the lane is up to your knees. I am ever anxious to come, for old age is heavy upon me, and the shadow of death is at my side.

'Metriche. Cheer up! don't malign Father Time; old age is wont to lay his hand on others too.

'Gyllis. Joke away; though young women can find something better to do than that. But, my dear girl, what a long time you've been a widow! It's ten months since Mandris was despatched to Egypt, and he hasn't sent you a single line; doubtless he has forgotten you, and is drinking at a new spring. For in Egypt you may find all things that are or ever were—wealth, athletics, power, fine weather, glory, goddesses, philosophers, gold, handsome youths, the shrine of the god and goddess, the most excellent king, the finest

museum in the world, wine, all the good things you can desire, and women, by Persephone, countless as the stones and beautiful as the goddesses that appealed to Paris.'

(Gyllis now reveals the purpose of her visit.)

'Gyllis. Listen to the news I have brought you after this long time. You know Gryllus, the son of Metachene, who was such a famous athlete at school, got a couple of blues at his university, and is now amateur champion bruiser? Then he is so rich, and he leads the quietest life; see, here is his signet-ring. Well, he saw you the other day in the street, and was smitten to the heart. And, my dear girl, he never leaves my house day or night, but bemoans his fate, and calls upon your name; he is positively dying of love.'

(Metriche, however, proves insensible to these flattering advances and remains faithful to Mandris.)

'Metriche. By the Fates, Gyllis, your white hairs blunt your reason. There is no cause yet to deplore the fate of Mandris. By Demeter, I shouldn't like to have heard this from another woman's lips. And you, my dear, never come to my house with such proposals again. For none may make mock of Mandris. . . . Threissa, let us have some refreshments; bring the decanter and some water, and give the lady something to drink. Now, Gyllis, drink, and show that you aren't angry.'

So the quarrel ends. The dust-heaps of Egypt held this new-old romance for a millennium and a half. And when at last it is brought again to the light of day, a few sentences are sufficient to give us more insight into the daily life of the Egypt of long ago than the most laborious researches and precise statements of the scholar.

'REJOICE, AND AGAIN I SAY, REJOICE.'

My song shall be of birds and flowers

And all the lovely things of earth;

The little leaves that clap their hands,

The health and wholesomeness of mirth;

The wonder in a baby's eyes,

The clinging clasp of loving hands;

The glee of frolic waves, that chase

Each other up the golden sands.

The morning stars together sang

When this old earth of ours was young;

'Tis we have lost the 'hearing ear,'

Not they who leave their songs unsung.

Some poets dip their pens in tears,

And some in wormwood and in gall—

With ev'ry 'bush afire with God'

And love the banner over all!

Oh, were my quill a feather dropp'd

From some bright angel in his flight,

My muse might soar on higher wing

To spread the gospel of delight!

M. HEDDERWICK BROWNE.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

A VERY remarkable book has been published.

It consists of the thoughts and ideas—embellished with a little exuberance, some invective, and occasional violent epithets—of a man who has always been sincere in his public statements and conduct. This book is of himself, and therefore it is a sincere statement. That is one of the chief reasons why it is remarkable, and why it grips the persons who read it, catches not merely at their minds, their reason, and their taste—it might not do all that—but, as truth and honesty, lays hold of something else within them. Looking back along the literary annals of his time, every casual reader knows that there comes now and then—not often, perhaps not once in a decade or even a generation—some book which, for a reason that it is difficult to define, runs through the life of the people—and other peoples too—like a flash of fire. It is rarely that any book does this on the strength of literary or artistic value, or because of the information that it contains, or because of revelation. Sometimes it is because of opinion. It is hard to seize on the point of quality that makes these works great in the minds of their admirers; it is often elusive or indefinable. But is it not the fact that if you make a close examination of such works you find that a dominant quality common to most of them is sincerity? Nothing ever did appeal to the minds of readers so keenly as plain sincerity; nothing ever will appeal to them so much. Literature in general was sincerer in the past than it is to-day, when the vices of opportunism and posing are so much practised; writers of old did not pretend so much. So now, when, not in books so much as in public words and actions, there is such insincerity, such deception; when even the most responsible persons express a sort of truth with the most important reservations, and snatch always at the opportunism of a moment, a book of sincerity is grateful, like a draught of sparkling water to lips that are parched and thick with thirst. This new book is the *Memories* of Lord Fisher. Catching the people who are vaguely meditating upon the general neglect of truth and honesty in affairs, this book with its sincerity, so unbridled that sometimes it becomes indiscretion, achieves a

remarkable effect. It is not well written—far from that (as to which an explanation to come). It is one of the worst-written books ever published, and it embraces some features that, but for the sincerity of this swearing sailor, would be merely ludicrous. Again, very many will disagree with opinions and ideas that Lord Fisher expresses on non-technical matters such as they can understand. Thus, rightly or wrongly, from the point of view of the good of the nation, a large proportion of our people will dissent from a plan that he seriously propounded and submitted many years ago to King Edward and others—the plan of sending our navy into the harbour of Kiel, and definitely ridding ourselves of the increasing menace of the German Fleet there and then, without any warning and without any declaration of war. That might—or it might not—have averted the world war; it might—or it might not—have postponed it. But even if such a plan ever was seriously thought of by any one in authority in this country, and then abandoned, as it must have been, is this the moment to disclose it, or would it better have been left forgotten in its abandonment? The nation holds rightly that though it made the most serious mistakes, and though its general policy, especially that horrible ‘balance of power’ arrangement, was stupid, it did not desire the war, and did nothing in the last resort to provoke it. This talk, then, of the scheme for ‘Copenhagening’ the German Fleet in Kiel harbour gives an uneasy twitch. It was a proposal for a bad thing—although Lord Fisher may not admit any badness about it—to avoid a worse evil that might befall us. There is worldly justification for such courses, but they have nothing whatever to do with morals and right. But, then, it is a point for Lord Fisher that hardly anything we have seen in these latter days has had much to do with pure and elemental right, though there has been the pretence of it. Again, much of the book is written in the manner of hasty, careless impulsiveness; it is a statement of thoughts as they rose in the writer’s own secret mind, all unpolished and unprepared for exportation to the people. So it is inevitable, this sailor being what he is, that much of the book should be in a form that village folks of the last generation

might have considered vulgar, because it is so far removed from their pretty conventionalities. Lord Fisher from time to time uses what many of those people would call 'bad language.' Here, anyhow, is a volume containing strange revelations, much history of Britain and her glorious navy, the views, the opinions, the earnest desires, the veritable naval passions, of this adventurous sailor, his animadversions upon the management of the navy at the present time, and his ideas for the future, and they are flavoured with unqualified sincerity. This, then, of necessity is a great book. Because of its dominating quality it abounds in blazing indiscretions. Lord Fisher has ambled well with kings—and the tales he tells of them! . . . 'On another occasion I was driving with him (King Edward) alone, and, utterly carried away by my feelings, I suddenly stood up in the carriage and waved to a very beautiful woman who I thought was in America! The king was awfully angry, but I made it much worse by saying I had forgotten all about him! But he added, "Well, find out where she lives and let me know," and he gave her little child a sovereign and asked her to dinner, to my intense joy!' Pretty proceedings, these, they would say in the villages where conventions rule and kings are praised and prayed for. But that is nothing, merely in passing.

* * *

Being a sailor, and a very special sailor, too, there is a considerable exuberance about Lord Fisher, beyond his candour. Likewise there is an ebullient humour which saves some of his harshest criticisms and condemnations from savagery. It is in a way a book of hornpipes and marlinespikes; the ocean wind blows through all its pages; it lashes to a foam; the salt spray is all about us; we roll on the North Sea, and do not rest in town; one feels wet, and seems at times to need some sort of spiritual oilskin. But, for all that, it is a deeply serious book, one in which high policy is set forth, and a path is pointed for an empire. We spoke of an almost ludicrous side of it. Well, see. Besides a Preface there is a 'Preamble' to the book, and the type of that 'Preamble'—some of it—half-an-inch in height, carefully measured, is the biggest we have seen in any book save some of the older Bibles used in churches. Let us quote that 'Preamble,' for it is a text. 'There is no plan nor sequence! Just as the thoughts have arisen, so have they been written or dictated! The spoken word has not been amended—better the fragrance of the fresh picked flower than trying to get more scent out of it by adding hot water afterwards! Also, it is more life-like to have the first impulse of the heart than vainly to endeavour after studied phrases! Perhaps the only curiosity is that I begin my life backwards, and leave my birth and being weaned till the end! "The last shall be first" is good for autobiography! I think a text is a good thing!

So I adopt the following (from R. L. Stevenson) as being nice for the young ones to read what follows: "To be honest, to be kind, to earn a little and to spend a little less, to make upon the whole a family happier for his presence, to renounce when that shall be necessary, and not be embittered, to keep a few friends, *but those without capitulation*, above all on the same grim condition to keep friends with himself, here is a task for all that a man has of fortitude and delicacy." We are told in a Note even before the 'Preamble' and the Preface, a Note that comes either from publisher or friend, that had Lord Fisher been allowed his own way there would have been no book. The volume consists in the main of the author's *ipsissima verba*, dictated during last September. One or two chapters were put together from fugitive writings which Lord Fisher had collected and printed ('in noble and eloquently various type') as a gift to his friends after his death. He himself in the Preface tells us that a gentleman he had never heard of once sent him a cheque for two thousand guineas, and asked him to let him have a short article on any subject. Lord Fisher returned the cheque. One is not surprised to hear that he has had 'some generous offers from publishers.' Sir George Reid said to him, 'Never write an autobiography. You only know one view of yourself—others see you all round.' But, says Lord Fisher, 'I don't see any harm in such *Memories* as I now indite! In regard to Sir G. Reid's observation, there's one side no one else can see, and that's the "inside." He has just talked this book to a typist as he thought it in more or less disjointed bits, with all the interjections included, thus: 'Again, this is a digression—but such must be the nature of this book when speaking *ore rotundo* and from the fullness of a disgusted heart, that such Lions should be led by such Asses.' The book can't convey my feelings, however carefully my good friend the typewriter is taking it down. All the quill-drivers, the ink-spillers, and the Junius-aping journalists will jeer at you as the editor, and say, "Why didn't you stop him? Where's the argument? Where's the lucid exposition? Where's the subtle dialectician who will talk a bird out of a tree?" . . . We'll get along with the Dardanelles now.' . . .

* * *

Let us for expediency catch the habit of the author and take him in items here and there. So only a trifle of his war thoughts and policies may be disclosed; but then the whole, such as it is, could be represented in nothing less than the book itself. His criticism of some of the war methods applied to the navy is not nice. All heard vaguely, some time after they had begun their speedy operations, of the 'Hush-Hush' ships, though according to war-time secrecy the facts were not permitted to be noised about. But *the* feature of these ships with big

guns was their tremendous speed, and Lord Fisher argued that that speed was armament in itself. The authorities, however, crippled the speed eventually in order to add real steel armour to the ships. So Lord Fisher speaks of them in this wise: 'One of the charms of the Christian religion is that the Foolish confound the Wise. The Atheists are all brainy men. Myself, I hate a brainy man. All the brainy men said it was impossible to have aeroplanes. No brainy man ever sees that speed is armour. Directly the brainy men got a chance they clapped masses of armour on the "Hush-Hush" ships. They couldn't understand speed being armour, and said to themselves, "Didn't she draw so little water that she could stand having weight put on her? Shove on armour!" and so bang went the speed, and the "Hush-Hush" ships, whose fabulous beauty was their forty shore-going miles an hour, were slowed down by these brainy men. Don't jockeys have to carry weights? Isn't it called handicapping? Isn't it the object to beat the favourite—the real winner? There really is comfort in the 27th verse of the 1st chapter of 1 Corinthians, where the Foolish are wiser than the Wise.' And then he proceeds to make strange disclosures about Admiralty ideas: 'Yes! and we still have ancient admirals who believe in bows and arrows. There's a good deal to be said for bows and arrows. Our ancestors insisted on all churchyards being planted with yew-trees to make bows. There you are! It's a home product! Not like those damn fools who get their oil from abroad! And I have now the Memorandum with me, delivered to me when I was Controller of the Navy by a member of the Board of Admiralty desiring to build sixteen sailing-ships! Again, didn't the Board of Admiralty issue a solemn Board Minute that wood floated and iron sank? So what a damnable thing to build iron ships! Wasn't there another solemn Board Minute that steam was damnable and fatal to the supremacy of the British Navy? Haven't we had admirals writing very brainy articles in magazines to prove that there was nothing like a tortoise? You could stand on the tortoise's back; you weren't rushed by the tortoise, whereas these "Hush-Hush" ships, they were flimsy, and speed was worshipped as a god. One mighty man of valour (only "he was a leper" as regards sea-fighting) told me at his luncheon-table that when one of these "Hush-Hush" ships encountered at her full strength of nearly a hundred thousand horse-power a gale of wind in a mountainous sea, she was actually strained! It's all really too lovely; but of course the humour of it can't be properly appreciated by the ordinary shore-going person. Yes, the brainy men, as I said before, crabbed the "Hush-Hush" ships; they couldn't understand that speed was armour when associated with big

guns because the speed enabled you to put your ship at such a distance that she couldn't be hit by the enemy, so it was the equivalent of impenetrable armour although you had none of it, and you hit the enemy every round for the simple reason that your guns reached him when he could not reach you. . . . What these splendid armour-bearers say is, "Give me a strong ship which no silly ass of a captain can hurt." . . . It all really is very funny—if it wasn't disastrous and ruinous!'

* * *

Let us take his naval and resourceful lordship in one of the patches of his casual revelation upon matters of the past. He was along the Mediterranean, and came into touch with Abdul Hamid, for whom, he tells us, personally he had a great regard, as the ambassadors had not. One who knew of these matters, he says, considered Abdul Hamid the greatest diplomat in Europe. 'Abdul Hamid,' he dictates to the typist, 'was exceeding kind to me and invited me to Constantinople, and he descanted (the Boer War then being on) what a risk there was of a big coalition against England. Curiously enough, his colleague the Pope had the same feeling. It is very deplorable, not only in the late war but also in the Boer War especially, how utterly our spies and our intelligence departments failed us. I was so impressed with what the Sultan told me that I set to work on my own account; and through the patriotism of several magnificent Englishmen who occupied high commercial positions on the shores of the Mediterranean, I got a central forwarding station for information fixed up privately in Switzerland; and it so happened, through a most providential state of circumstances, that I was thus able to obtain all the cypher messages passing from the various foreign embassies, consulates, and legations through a certain central focus, and I also obtained a key to their respective cyphers. The chief man who did it for me was not in Government employ; and I'm glad to think that he is now in a great position—though not rewarded as he should have been. No one is. But as to any information from an official source reaching me, who was so vastly interested in the matter, in the event of war where the Fleet should strike first, all our diplomats and consuls and intelligence departments might have been dead and buried.' Here is another revelation of a different kind and of much more recent date. All British people know how the *Queen Elizabeth* was the pride of the navy during the war. Now that peace—of a kind—is here, there is a bigger and a grander ship, the wonder of the world, the *Hood*, afloat. Please Providence, and the *Hood* will not need to do such fighting and face such risks as 'Q.E.' as they called her in the navy, did. Nor, then, will the *Hood* have such a moment of supreme glory as that of which we were witness when, in the

North Sea on a November day, Beatty stood on her quarter-deck and took the salute of the Grand Fleet that went sailing by in his honour—with the German Fleet prisoners among them. We remember the pride of a seafaring nation when in whispers we heard something of the steaming, shooting, tonnage, magnificence, of the *Queen Elizabeth*, but the pride was tempered by certain tremors as the news was known that she had gone to the Dardanelles. One submarine, one torpedo, one big ship, however big, and, alas! sometimes catastrophe. There were anxious moments then. So hear Lord Fisher at the end of a letter to Lord Cromer: 'As to the *Queen Elizabeth*, Mr Churchill is right in saying there was great tension between Kitchener and myself. He came over to the Admiralty, and when I said, "If the *Queen Elizabeth* didn't leave the Dardanelles that night I should!" he got up from the table and he left! and wrote an unpleasant letter about me to the Prime Minister! *Lucky she did leave!!* The German submarine prowling round for a fortnight looking for her (and neglecting all the other battleships) blew up her duplicate wooden image.'

* * *

Here and there he touches upon various points of comparison between sea-war and land-war. We are given to understand that if Britain had concentrated on the sea-war during the fateful five years, it would have been better for Britain. 'I was the originator,' he says, 'of the Naval War College at Portsmouth—that's quite a different thing from an Imperial General Staff at the War Office. The vulgar error of Lord Haldane and others, who are always talking about "clear thinking" and such-like twaddle, is that they do not realise that the army is so absolutely different from the navy. Every condition in them both is different. The navy is always at war, because it is always fighting winds and waves and fog. The navy is ready for an absolute instant blow; it has nothing to do with strategic railways, lines of communication, or bridging rivers, or crossing mountains, or the time of the year when the Balkans may be snowed under, and mountain passes may be impassable. No! The ocean is limitless and unobstructed; and the fleet, each ship manned, gunned, provisioned, and fuelled, ready to fight within five minutes. The army not only has to mobilise, but—thank God! this being an island—it has to be carried somewhere by the navy, no matter where it acts.' Then a little later there is this breezy incident related: 'On one occasion I got into a most unpleasant atmosphere. I arrived at a country house late at night, and at breakfast in the morning, I not knowing who the guests were, a Cabinet Minister enunciated the proposition that sea and land war were both in principle and practice alike. At once getting up from the breakfast table, in the heat of the moment, and not knowing that distinguished

military officers were there, I said, "Any silly ass could be a general." I graphically illustrated my meaning. I gave the contrast between a sea and a land battle. The general is somewhere behind the fighting-line, or he ought to be. The admiral is *in* the fighting-line, or he ought to be. The admiral is indeed like the young subaltern, he is often the first "over the top." The general, at a telescopic distance from the battle-scene and surrounded by his Kitcheners, and his Ludendorffs, and his Gross von Schwartzhoffs, has plenty of time for the "clear thinking" à la Lord Haldane; and then, acting on the advice of those surrounding him, he takes his measures.' But there is another view of the question of army and navy to be taken. In 1904 he had been to see what the submarines could do in the English Channel, where they had been practising and manœuvring, and he is enormously enthusiastic upon the courage and resource of the young commanders. He would like to 'shove the same ginger into the young military aspirants . . . but the whole secret is to catch them very young and mould them while they are then so plastic and receptive to be just what you want them.' He writes to his close friend, Lord Esher, saying that they should 'embark an army corps every year and give them sea-training.' But once adventure forth with Lord Fisher into the possibilities and the likelihoods of the future, and we see strange visions. He believes, as we know, most fervently in oil, though there is nothing very visionary in that. And here is a prophecy: 'Now we've reached the Epoch—prodigious in its advent—when positively the Air commands and dominates both Land and Sea; and we shall witness quite shortly a combination in one structure of the aeroplane, the airship, the parachute, the common balloon, and an aerial torpedo, which will both astound people by its simplicity and by extraordinary possibilities, both in war and commerce (the torpedo will become cargo in commerce). The aeroplane has now to keep moving to live—but why should it? The aerial gyroscopic locomotive torpedo suspended by a parachute has a tremendous significance.'

* * *

The business side, as we may call it, of Lord Fisher's book has so much importance and significance that the lighter side, that of simple but rare anecdote, more or less detached from high service affairs and dealing with great personages, may be too much neglected, though it occupies so many of the pages. King Alfonso has been much in the public eye of late. King Edward went with Lord Fisher to Cartagena many years ago, and there Don Alfonso was very cordial to Lord Fisher because, we are assured, Britain had seven Dreadnoughts ready before the Germans had one. 'In fact,' says Lord Fisher, 'when I told him this piece of

news, as we were walking up and down the deck, with King Edward and Queen Alexandra watching us from two deck-chairs, King Alfonso was so delighted that he threw his arms round my neck, cried "You darling!" and kissed me. Then he put his hand in his waistcoat pocket, took out a chocolate, and popped it into my mouth.' Those who read history merely in history-books never imagine, perhaps, that kings could be so gay. But the Fisherian anecdotes of King Edward are the most entertaining things. It is hard to fancy that august and very popular

monarch, 'white with anger,' putting to Lord Fisher the very pertinent question, 'Look here, am I the king, or are you?' or the admiral telling His Majesty that 'kings don't count;' or his remarking once, 'Sir, that was a real low form of cunning on your Majesty's part sending to ask after Keir Hardie's stomach ache!' and the king, turning on him 'like a mad bull,' and saying, 'You don't understand me. I am the king of ALL the people! No one has got me in their pockets, as some of them think they have!' The admiral was much devoted to the king.

THE PARTS MEN PLAY.

CHAPTER IV.—PROLOGUE TO A DINNER-PARTY.

I.

EVEN *unusual* dinner-parties begin like ordinary ones. There is the discomfiture of the guest who arrives first, subjected to his hostess's reassurances that he is not really early. After what seems an interminable length of time, during which a score of conversational topics are broached, and both hostess and guest are reduced to a state bordering on mutual animosity, the remainder of the party arrive *en masse*, as if by collusion. The butler (who likes to chew the cud of reflection between the announcements) is openly pained, while the distracted hostess must manage the introductions, and, as friendships are begun or enmities renewed, endeavour to initiate the new-comer into the subject of conversation immediately preceding his or her entrance. As the good woman's subconscious mind is in the kitchen, and as she is constantly interrupted by the necessity of greeting new arrivals, she usually succeeds in mystifying every one, and creating that atmosphere of 'nerves' so familiar to denizens of the best sets.

But we had almost forgotten—there is always one guest who is late.

The fateful hour mentioned in the dinner invitation arrives, strikes, and floats down the mists to the eerie catacombs of the Past. The hostess knows that the cook, with arms akimbo, is breathing rebellion, but tries to blot out the awful vision by an extra spurt of hollow gaiety.

Ten minutes pass.

Conversation flags. The portly bachelor who lives at his club wonders why he didn't have a chop before he came. His fellow-diners try to refrain from the topic, but it is as hopeless as trying to talk to an ex-convict without mentioning jails. Finally, in an abandon of desperation, they all turn inquiringly to the hostess, who, affecting an ease of manner, says pleasantly, 'Dear me! What *can* have detained Mr So-and-so? I wonder if we had better go in without him?'

And then he arrives—the jackass—and in a

sublime good-humour! He tells some cock-and-bull story about his taxi breaking down, and actually seems to think he's done rather a smart thing in turning up at all. In short, he brings in such an air of geniality and self-appreciation that the guest who arrived first has more than a notion to 'have him out' and send him to a region where dinner-parties are popularly supposed to be unknown.

No—the lot of a lady who gives dinners is not a happy one.

II.

On this Friday night of November in the year 1913, Lady Durwent sat by the fire in the drawing-room and discussed music with Norton Pyford. Having sacrificed his watch on the altar of art, he had been compelled to rely on appetite, with the result that he arrived just as eight was striking. Lady Durwent did her best, but as she knew nothing of music, nor he anything of anything else, the situation was becoming difficult, when the entrance of Madame Carlotti brought welcome relief.

That lady was wearing a yellow gown rather too tight for her, so that her somewhat ample flesh slightly overran the confines of the garment, giving the effect that she had grown up in the thing and was unable to shed it. This impression was heightened by a mannerism, repeated frequently during the evening, of grasping her very low bodice with her hands, exhausting her breath, pulling the bodice up, and compressing herself into it. It was an innocent enough performance, but invariably left the feeling that she should retire upstairs to do it.

She wore a yellow flower in her hair; her stockings were a rich yellow with a superimposed pattern like strands of fine gold, and her dainty feet were enclosed in a pair of bronzed shoes. As her lips were heavily carmined and her eyes brilliantly dark, Madame Carlotti's was a distinctly illuminating presence.

But the sunniness of her entrance was dimmed by the lack of audience. She had not expended

her genius to throw it away on a strangely dressed young man whose hair fell straight and black over a large collar that had earned a holiday some days before, and whose velvet jacket was minus two buttons, the threads of which could still be seen, outstretched, appealing for their owners' return.

'Lucia, my dear,' said Lady Durwent, just like an ordinary hostess, 'you look' (*sotto voce*) 'simply wonderful! I think you have met Mr Norton Pyford, the Norton Pyford, haven't you?'

'Hah d' ye do?' said the Pyford.

'Chaired,' minced Madame Carlotti.

'Lucia, take this chair by the fire. You must be frozen.'

'Ah, grazie, Sybil. What a perfectly mesurable climate you have in this London!'

'Just what I tha-a-y,' bleated Mr Pyford, sinking into his chair in an apparently boneless heap. 'The other night, at a fella's thupper-party, I'—

'MRS LE ROY JENNINGS.'

The resolutionist swept into the room clothed in black disorder, much as if she had started to dress in a fit of temper and had been overtaken by a gale.

She knew Madame Carlotti.—She did *not* know Mr Norton Pyford, the Norton Pyford.—She was glad to know him. He muttered something inarticulate, and glancing at the ring of women about him, shrank into his clothes until his collar almost hid his lower lip.

'We were discussing,' said Lady Durwent, vaguely relying on the last sounds retained by her ear—'discussing—suppers.'

'Don't believe in 'em,' said Mrs Jennings sternly; 'three regular meals—tea at eleven and four, and hot milk with a bit of ginger in it before retiring—are sufficient for any one.'

The Italian took in the forceful figure of the New Woman and smiled with her teeth.

'Madame Jennings,' she said, 'perhaps finds sufficient distraction in just ordinary life,—and *una tazza di tè*. But we who are not so—*comment dirai-je?*—so self-complete must rely on frivolous things like *una buona cena*.'

'Don't believe in 'em,' reiterated the resolutionist; 'three regular'—

'Ah, *c'est mauvais*,' gesticulated Madame Carlotti, who alternated between Italian and French phrases in London, and kept her best English for the Continent.

'Mr Pyford,' put in Lady Durwent, desecrating a storm on the yellow and black horizon, 'has just written'—

'Mr H. Stackton Dunckley,' announced the butler, with an appropriate note of *mysterioso*. Lady Durwent summoned a blush, and rose to meet the ardent author, who was dressed in a characterless evening suit with disconsolate legs, and whose chin was heavily powdered to conceal the stubble of beard grown since morning.

'You have come,' she said softly and dramatically.

'I have,' said the writer, bowing low over her hand.

'I rely on you to be discreet,' she murmured.

'Eh?'

'Discreet,' she coquetted. 'People will talk.'

'Let them,' said Mr Dunckley earnestly.

'Madame Carlotti, I think you know Mr Dunckley—H. Stackton Dunckley—and you too, Mrs Le Roy Jennings; you clever people ought to be friends at once. And I want you to meet Mr Pyford, the'—

'Hah d' ye do?'

'How are you?'

'Ro—splendid, thanks.'

'We were discussing,' said Lady Durwent—'discussing'—

'MR AUSTIN SELWYN.'

Every one turned to see the guest of the evening, as the hostess rose to meet him. He was a young man on the right side of thirty, with dark, closely brushed hair that thinned slightly at the temples. He was clean-shaven, and his light-brown eyes lay in a smiling setting of quizzical good-humour. He was of rather more than medium height, with well-poised shoulders; and though a firmness of lips and jaw gave a suggestion of hardness, the engaging youthfulness of his eyes and a hearty smile that crinkled the bridge of his nose left a pleasant impression of frankness, mingled with a certain *naïveté*.

'Mr Selwyn,' said Lady Durwent, 'I knew you would want to meet some of London's—I should say some of England's—accomplished people.'

'Oimè! I am afraid that obsolescences me,' smiled Madame Carlotti, whose social charm was rising fast at the sight of a good-looking stranger.

'No, indeed, Lucia,' effused the hostess. 'To be the personification of Italy in dreary London is more than an accomplishment—it—it'—

'It is a boon,' said Dunckley, coming to the aid of his floundering loved one.

'Exactly,' said Lady Durwent with a sigh of relief. 'Madame Lucia Carlotti—Mr Selwyn of New York.'

'Buona sera, signora.'

'Buona sera, signore.'

He stooped low and pressed a light kiss on the Neapolitan's hand, thus taking the most direct route obtainable by an Anglo-Saxon to the good graces of a woman of Italy.

'How well you speak Italian!' cooed Madame Carlotti; 'so—like one of us.'

The American bowed. It was rarely he achieved a reputation with so little effort. The remaining introductions were effected; the clock struck eight-thirty; and there followed an awkward silence, born of an absolute unanimity of thought.

'Of course, you two authors,' said Lady

Durwent, forcing a smile, 'knew of each other, anyway. It's like asking H. G. Wells if he ever heard of Mark Twain.'

The smile in the American's eyes widened. 'Lady Durwent flatters me,' he said. 'I am not widely known in my own country, and can hardly expect that you should know of me on this side of the Atlantic.'

'What,' said Mr Dunkley—'what does New York think of "Precipitate Thoughts"?''

The American considered quickly. He wished that in conversation, as well as in writing, people would use inverted commas.

'Whose precipitate thoughts?' he ventured.

'Mine,' said H. S. D., with ill-concealed importance.

'Oh yes, of course,' said Selwyn, wondering how any one so stationary as the other could project anything precipitate. 'New York was keenly interested.'

'Ah,' said the English author benignly, 'it is satisfactory to hear that. Of course, the great difference between there and here is that in New York one impresses: in London one is impressed.'

An ominous silence followed this epigrammatic wisdom (which Dunkley had just heard from the lips of a poet who had succeeded in writing both an American and an English publishing house into bankruptcy) while the various members of the group pursued their trains of thought along the devious routes of their different mentalities.

'Dear me!' said Lady Durwent anxiously, 'what can have detained'—

'MR JOHNSTON SMYTH.'

With a jerky action of the knees, the futurist briskly entered the room with all the easy confidence of a famous comedian following on the heels of a chorus announcing his arrival. He looked particularly long and cadaverous in an abrupt, sporting-artistic, blue jacket, with sleeves so short that when he waved his arms (which he did with almost every sentence) he reminded one of a juggler requesting his audience to notice that he has absolutely nothing up his sleeves.

'Lady Durwent,' he exclaimed, striking an attitude and looking over his Cyrano-like nose with his right eye as if he were aligning the sights of a musket, 'don't tell me I'm late. If you do, I shall never speak to the Duke of Earldub again—never!'

As he refused to move an inch until assured that he was not late, and as Lady Durwent was anxious to proceed with the main business of the evening (to say nothing of maintaining the friendship between Smyth and the Duke of Earldub, whose part in his dilatory arrival was rather vague), she granted the necessary pardon, whereupon he straightened his legs and winked long and solemnly at Norton Pyford.

'Good gracious!' cried Lady Durwent just

as she was about to suggest an exodus to the dining-room, 'I had forgotten all about Elise!' She hurriedly rang the bell, which was answered by the butler. 'Send word to Miss Elise that'—

'Milady,' said the servitor, addressing an arc-light just over the door, 'the Honorable Miss Durwent is descending down the stairs this werry minute.'

III.

There are moments when women appear at their best—fleeting moments that cannot be sustained. Sometimes it is a tremor of timidity that lends a fawn-like gentleness to their movements, and a frightened wistfulness to the eye, too subtle a thing of beauty to bear analysis in words. A sudden triumph, noble or ignoble, the conquering of a rival, the sound of a lover's voice, will flush the cheek and liberate the whole radiance of a woman's being. Such moments come in every woman's life, when the quick impulse of emotion achieves an unconscious beauty that defies the ordinary standards of critical appreciation. It is that little instant that is the torch to light a lover's worship or a poet's verses—to send strange yearnings into a young man's breast and set an old man's memory philandering with the distant past.

It was such a moment for Elise Durwent as she stood in the doorway, the overhanging arc touching her hair and shoulders with the high lights of some master's painting. Conversation ceased, and in every face there was the universal homage paid to beauty, even though it be tendered grudgingly.

She was dressed in a gown of deep blue, that colour which renders its ageless tribute to the fair women of the world, and from her shoulders there hung a black net that subdued the colour of the gown and left the graceful suggestion of a cape.

'I am so sorry, mother,' she said. 'I was reading—and quite forgot the time.'

Austin Selwyn stroked the back of his head, then thrust both hands into his pockets. There was something in the girl's appearance and the contralto timbre of her voice that left him with the odd sensation that she was out of place in the room—that her real sphere was in the expanse of unbridled nature. He could see her wealth of copper-hued hair blown by the western wind; he could picture her joining in Spring's minuet of swaying rose-bushes.

'My daughter Elise—Mr Austin Selwyn.'

He bowed as the words penetrated his thoughts; then, glancing up, he felt a sudden contraction of disappointment.

The girl's eyes had narrowed, and were no longer sparkling, but steady—almost to the point of dullness. Her lower lip was full, and too scarlet for the upper one, which chided its sister for the wanton admission of slumbering passion;

and her voice was abrupt. He almost cried out '*Legato, legato,*' to coax back the lilt which had caressed his ear a moment before.

He was dimly conscious that dinner was announced, and that amidst a babel of tongues he was being led by, or was leading, Lady Durwent into the dining-room. He heard the resolutionist and Dunckley both talking at once, and felt the melancholy languor of Pyford floating like incense through the air. He had an obscure recollection of sitting down next to his hostess; that the table, like Arthur's, was a round one; that Johnston Smyth was seated beside Miss Durwent and was ogling one of Lady Durwent's maids. Then he remembered that he had heard some voice in his ear for several minutes past, and, growing

curious, took a surreptitious glance, to find that it belonged to Madame Carlotti.

'Meester Selwyn,' she said indignantly, 'you have not been listening to me.'

'That is true, signora,' he said, 'but I have been thinking of you.'

'Yes?' she purred, leaning towards him. 'What did you thought?'

He turned squarely to her in an impassioned counterfeit of frankness. 'Are all Italian women beautiful?' he murmured.

'Hush-sh!' Her hand touched his beneath the table, reprovingly and tenderly.

'Mr Selwyn,' said Lady Durwent, 'you have not tasted your soup'—

(To be continued.)

'KLONDIKE' BOYLE.

PART II.

V.

IN the next and most important phase of Boyle's labours, it will be seen that, largely through him, peace was arranged between the Bolsheviks and Rumania. We have forgotten too soon how pluckily Rumania fought on when the Allies let disaster grip her by the throat. Tortured, robbed, betrayed, she believed in Britain, and her gallant army was ready to retire into Russia and fight on, even if the Germans occupied all Rumania. And then, to fill her cup, the spectre of Bolshevism raised its skeleton's grin on her borders, and the Russia she had always known as her friend became her enemy.

At the risk of his life, a Canadian from the Yukon braved the anger of Rackovski, the most powerful member of the Russian Supreme College. This man, who was himself a Rumanian, would not hear of peace with Rumania; but by deliberate intrigue Boyle turned the man's associates against him, and secured an offer of peace, which he took to Rumania, passing through the lines, and being fired at by Bolshevik gunners. In the subsequent negotiations Boyle had to act as intermediary; and on one occasion, while he was flying just above the Dniester in an aeroplane, a Rumanian battery fired at him, and death was missed by a matter of inches.

Eventually peace was signed, and Boyle's greatest achievement was completed.

VI

But though his greatest achievement had been performed, his outstanding exploit was yet to come.

Both Rumania and Russia were holding prisoners, and in Odessa there were some fifty odd Rumanians who had been detained, prac-

tically as hostages. Included among them were generals, a number of high naval officials, a few senators and members of parliament, and various wealthy business men. Colonel Boyle was given authority to effect the exchange of this party for a similar number of Russians, and, as well, to superintend the safe-conduct of 100,000 Russian troops who were being disarmed and returned to their own country.

Rackovski gave him authority for a special train to take the Rumanians from Odessa to Benderi; but this man, one of the Bolshevik leaders, was a German agent, and not only lied to Boyle about the position of the enemy, but left Petrograd secretly a day before Boyle. As a result, early one morning a gang of Bolsheviks, known as the Rumanian Revolutionary Battalion (in reality a number of Bulgarian escaped criminals), went to the prison, and taking the Rumanian prisoners, placed them on board the steamship *Imperator Traian*.

At nine that morning Boyle received this information from Madame Pantazi, a Canadian woman married to the Director of the Rumanian Navy, who was himself one of the fifty prisoners. Pluckily offering her services as interpreter, she accompanied the 'Klondike King' as he proceeded to turn things upside-down.

He first procured an order of release from the Bolshevik leader Brashanaw, and succeeded in getting the prisoners from the ship to the dock, although they were still guarded. At that time they were loading the *Imperator Traian* with the villainous Rumanian Revolutionary Battalion, and things began to assume an ugly aspect. This band of men delivered the ultimatum that the fifty prisoners should accompany them to the Crimea, or be shot where they stood.

Boyle held his ground until a riot started and about eighty armed men lined the side of the ship, when he ordered the prisoners on board;

then, though the revolutionary leaders tried to stop him, he forced his way on to the ship as well, conscious of the fact that what little chance the captives had of life rested entirely in his hands.

In passing, it is pleasant to be able to relate that Madame Pantazi's fearless conduct resulted in her being personally decorated by the King of Rumania.

Eventually the ship reached Theodosia, in the Crimea, where Boyle and his party were interned in the Naval Quarantine Grounds, close to the docks. Boyle at once got in touch with the British vice-consul, who turned out to be a splendid type of man, and together they discussed the confused political situation of the town, and how best to exploit it. As usual, various Bolshevik parties were fighting for supremacy. The Rumanian revolutionary scoundrels were plotting with some local anarchists to get control, but up to the moment the real leader was a working-man, who dominated everything by innate personality.

Boyle went to see this man, who not only expressed his desire to help the prisoners, but secretly gave the Canadian permission to leave the town, and to procure twenty Chinese members of the International Army. While these Oriental gentlemen were known by this euphonious name, they were actually paid murderers of absolutely unbiassed minds. With this merry band Boyle returned to the town, and contrived to make arrangements with a little ship, the *Chernamore*, to take the prisoners to Sebastopol. One hour before sailing-time he cut the telephone-wires to the town, marched his party to the ship, and leaving ten Chinamen at the entrance of the dock to hold it against attack by the revolutionaries, he managed to get away with his fifty prisoners and ten Chinese.

On arrival at Sebastopol he was notified that the prisoners belonged to the Black Sea Fleet, who would take charge of them, but that he could have a special train for himself to any destination he chose. As this meant certain death for his charges, Boyle lined up his ten warriors and addressed them something after this fashion: 'Gentlemen, there is going to be a scrap, and I intend it to be a fight to the finish. Will you stand by and help me?'

A huge fellow on the right with two knives in his belt was appointed spokesman.

'You pay us two roubles a day?' he said.

'Yes,' said the colonel.

'Very well; we fight.'

With this substantial backing, Boyle refused to give up his prisoners, and after some heated controversy the fleet agreed to let him continue his journey, provided he could get a safe-conduct from General Mackensen. To secure this he telephoned to the Prime Minister of Rumania, who was successful in getting it from Mackensen.

Armed with the document, Boyle set sail, and landed his prisoners at Sulina (at the mouth of the Danube), where the Russians from the Rumanian prisons were waiting under guard of two officers.

The Klondiker announced his intention of sailing with his new cargo on the Thursday morning, it being then Tuesday, when a fresh and formidable situation presented itself.

The port was in the hands of the Austrians, who had four monitors and two large seaplanes there. One small Rumanian cruiser was also anchored in the harbour, and on Tuesday evening the commander of this ship notified Boyle that the Austrian commander had ordered him to inform the Canadian that he could not sail. The reasons given were that it was a Bolshevik ship, that Austria was at war with the Bolsheviks, and that a British officer was on board.

Boyle protested that he had Mackensen's safe-conduct. The Austrian was not only adamant, but arrogant. Boyle demanded that the Austrian's case be put in writing. The commander did so, amidst a verbal duel which was marked by lack of politeness on both sides. The Austrian claimed that he was under orders from the Austrian High Command, and not from Mackensen.

Nothing daunted, Boyle refused to change his sailing, and sent the following historic message to his enemy: 'I am a Briton, and therefore I keep my word. I say I am going to sail at ten o'clock to-morrow morning, and I will sail at ten o'clock to-morrow morning. You are an Austrian, and therefore you will not keep your word. You say you will prevent me. You shall not prevent me.'

Early on Thursday morning Boyle got steam up, and the four monitors cleared for action. One dropped down-stream, one took position on the opposite side of the canal, and the remaining two drew up directly in front of his little ship. In addition to these manoeuvres, the two seaplanes were manned, and their machine-guns trained on the adventurer.

'I sized the situation up,' Boyle said to a friend of his in London some months afterwards, 'and figured that from a fighting standpoint I hadn't much chance. My boat was only a poor little freighter with one 2-inch gun in the stern, but I thought that if they sank me it would be excellent propaganda in stirring up trouble between the Germans and the Austrians. So I put my prisoners on shore, cleared all the lines but one at the bow and one at the stern—and waited for ten o'clock.'

At 9.30 a message arrived asking the colonel to meet the Austrian commander on board the Rumanian cruiser, and as the Canadian had suggested that ship as a suitable meeting-ground, he went aboard. The Austrian was extremely nervous, and in jerky sentences informed Boyle that he had received confirmation of Mackensen's

telegram, and his party would be allowed to proceed.

'Very well,' said the colonel; 'but I want you to understand that I should have sailed with or without your permission.'

And having thus had the last word, he boarded the *Chernamore* with his prisoners, and steamed from the harbour. Throughout the affair Commander Lazv, of the Rumanian cruiser, proved a staunch and fearless friend.

Words are strange things. The most carefully planned phrases frequently fail to convince. Occasionally a man writes a sentence almost without thought of construction, and it lives for centuries.

'I am a Briton, and therefore I keep my word.'

We shall not soon forget that.

VII.

Boyle's subsequent activities were confined to Rumania and south Russia, but his later work was of a political nature, and the War Office will not authorise its publication. In Rumania he took charge of the food situation, and performed such a number of offices for our Ally that he has been called 'The Saviour of Rumania;' and Joe Boyle of Dawson City was created Duke of Jassy.

There is no space to deal with his last great exploit when he organised an expedition to save the Russian royal family. As usual, he broke down all obstacles, and nothing but the unwillingness of the ill-fated royalties to venture

from their palace-prison in the Crimea stood in the way of their freedom. The King of Rumania had asked Boyle to undertake the task, and intended to place the Palace of Sinaia at the ex-Tsar's disposal.

And that is the story of 'Klondike' Boyle. It is doubtful if Canadian history can show a man more fearless and audacious, or one whose adventures have been more debonair and chivalrous.

As I finish this little sketch word comes that the Canadian Government is to give Rumania an open credit for \$25,000,000 for trade with Canada. On more than one occasion I saw Lieutenant-Colonel Boyle making his way to the Canadian Trade Commissioner's office in London, so it is not difficult to trace the hand of the 'Klondike King' in this matter. This is but one little result of the work of the man who so honourably wore 'CANADA' on his shoulders, and made that name stand for absolute integrity. I believe Boyle is to become a permanent resident in Rumania, where he will act as guardian to Rumanian-Canadian interests.

I had almost forgotten this. The French Government bestowed the Croix de Guerre on 'Klondike' Boyle for invaluable services in connection with the French. But that exploit is something that will have to remain a mystery until the 'Klondike King' talks. And, from my knowledge of him, I think that will not be for a long, long time.

THE END.

THE CANDLESTICK.

By T. PARSON.

I.

EARNSHAW was out; but when I gave my name, his housekeeper beamed intelligently, and directed (rather than invited) me to wait.

'He expected to be in by four, I know,' she explained; adding the benevolent afterthought, 'I'll bring you a cup of tea.'

Accordingly I found myself standing by a sizzling wood-fire in a comfortable study, and as I drank the tea I half-enviously wondered where my friend procured it, his furniture, his housekeeper, and his other appurtenances. The whole place seemed comfortable; the room possessed just that degree of shabbiness which is attained only by good old furniture, and which invites repose.

I sat down in the grandfather-chair by the sheepskin rug and looked about me. The room faced west into a well-kept shrubbery, where an elderly man was working with a leisureliness born of long practice. The light came through this window with a glow that made me feel drowsy after my long walk from the station.

My attention wandered among the objects caught by the sinking sun and by the leaping flames in the hearth. Earnshaw's taste did not lead him to the collection of knick-knacks, though I knew that the drawing-room contained china handed down from his forebears. But here, where the bachelor did his work and spent much of his leisure, there was little to arrest the eye—two large book-cases, a well-covered writing-table, a fine clock on the mantelpiece, which chimed the third quarter as I turned towards it; and the other ornaments beside it were of the same grave and respectable sort.

The sunlight grew dimmer and began to retreat in a thin streak of gold along the carpet. I watched it move until it touched something that glittered brightly on the writing-table. The next moment the glint had vanished, and since at the same time the leisurely gardener also ceased his monotonous whistling, and lounged away out of sight and hearing, I suddenly felt strangely alone. I turned to the stirring fire and stretched out my legs across the rug. But though I looked at the incandescent

sparks that fell like liquid from the logs or flew in troops up the chimney, I began to feel eerie, and my thoughts moved uncomfortably. Suppose Earnshaw did not turn up in time for me to catch my train back to the north? Suppose I waited till it was too late, and he did not put me up for the night? I was meandering along this track like a girl on her first week-end visit without her mother. I shook myself upright, and decided that I was dropping asleep, a proceeding that makes a man appear foolish if his host comes into the room without awakening him. I began to wonder how much Earnshaw had altered since those South African days when he was a good fellow who could see the point of a joke—even if levelled at himself. We had been great pals in those days, and though we had seen little of each other since, and neither of us was a good correspondent, I had reason to believe that he still kept his regard for me, as I for him.

A log fell forward, sending a flame shooting up the old chimney and lighting for a moment every corner of the small room. Good heavens! What was that? I could have sworn that a hand was laid on the writing-table, just by the candlestick I had already noticed. To my excited vision the candlestick moved ever so slightly to one side. Nonsense! I must be more fatigued than was usual with me after a journey; the flaming fire was playing tricks with my senses.

I rose and strolled round the room, looking at everything in turn, and scanning the garden between the heavy folds of the curtains. I lifted the candlestick and gazed at it thoughtfully, reflecting that to be caught examining the household possessions of even an old friend is not a dignified situation. I remained standing by the table, however, long enough to admire the chasing of the brass, its clear-cut finish not yet defaced by the polishing of years. I am completely ignorant of the origin and the value of such things, and as I put it back in its place the words crossed my mind, 'Brummagem, I suppose; most of them are.'

It struck me as rather odd that Earnshaw should care to flank his elegant silver inkstand, bearing an inscription and the date 1782, by a single brass candlestick, when he must have a suitable pair somewhere about the house. But it was no business of mine, and as I moved back to the fire I picked up the current number of *Punch* from where it lay in my path on a spindle-legged table.

For a few minutes I turned over the pages, but the clock striking the hour made me look up. A slight sound came from across my shoulder; this time there was no mistake about it. I looked round with a queer feeling that something was about to happen; there was nothing of surprise or fear in my mind—I was simply expectant. . . .

II.

I found myself in a long, low room, on the upper floor of a house, to judge by the sounds from without. A great beam supported the ceiling, but the room was otherwise not of a rough appearance. The polished floor was covered with skins of beasts; the walls were hung with a few good etchings, one of which I recognised to be a Rembrandt. A leaf of newspaper lay upon the floor; but either the light was not good enough to enable me to read any of it, or the script was in a foreign tongue. The air was hot and stifling, and strangely dry upon my cracked lips; yet there was a growl of thunder in the distance. Beside the window was a trail of ashes; it looked as if papers had been hastily burned and flung out, only to be partially borne back by the breeze. The whole room seemed to be, not gradually decaying from neglect, but suddenly abandoned, left to itself, covered with the undisturbed dust of forgotten things. Something about its forlorn state told me that desertion, panic, a sudden *trek*, had left the house forsaken. My mind leaped to realisation. How many other deserted homesteads had I not seen, though I could swear that never before had I been in this particular room? There was the usual furnishing of a Dutch bedchamber; there was heavy old wood, blue and white pottery, and brassware that still gleamed in spite of its woeful tarnish.

I waited in some excitement for what might follow. There were footsteps coming along a corridor or a landing outside the door, which presently opened slowly, giving entrance to a young girl. I was filled with amazement that such a creature should yet be alive in such a house. I was impelled to speak, but the knowledge came that, though my spirit and intelligence were there, she could not see me. She came slowly into the room, her eyes full of a troubled doubt. She paused in the centre of the floor and looked up thoughtfully to the sky above the mimosas and the pepper-trees outside. Her dress, though it was torn, as if she had clambered through thorns, was good, and suited to the house; her hair was neat; and her face, if wan, was made interesting by the mobile lips and the large dark eyes.

Suddenly she started and moved to the window, looking with a frightened gaze at something in the distance. I realised that the sound that had been in my ears all the time was increasing and coming nearer. It was the tramp, tramp, tramp, and jingle, jingle, jingle, of armed men and their accoutrements. The trees outside obscured the view. The garden seemed familiar, though I had not seen such a blaze of Indian cress for years. But sounds are easy to recognise; there were shouts, words of command, men dismounting, a horse galloping away

—all the things among which I had lived in the old South African days.

Then there were voices beneath the window, an officer's and another's, probably a sergeant's. From where I stood and could not move, they were invisible; but I could catch a word or two of their conversation—the tones were English. The girl in the window seemed in some way to be my own embodiment; or, rather, we were in so complete a sympathy that I knew what she felt, though I could not use her senses. I knew the terror that thrilled her as she looked and listened.

They were to burn down the house. A horror indescribable seized me at the thought. Could the girl understand what they were saying? I felt sure she could not. Perhaps she knew a word here and there; but she showed no more terror than before, nor any sign of an attempt to escape. Of course, there would be a search through the house, and some one would discover her and see that she was safely disposed of. I thought I recognised some of the voices below; good fellows all of them—there was nothing to fear from them. Then there came more words of command; the search was to begin. I knew the kind of thing—the inspection of the house, the selection of loot, the survey of surrounding land. I realised that in this case the search would not be prolonged, since the empty state of the farmstead was unmistakable.

There were hurried steps along the *stoep* and on the stairs. The room appeared to be in a wing of the house, for I could hear men coming up and then turning away at a little distance from the door, until their boots made but a muffled beating along the floors. But at last one man stopped, a singularly deliberate, even tread that I knew, without realising whose it was. The girl shrank and glanced desperately out of the window, whence words still rose in business-like tones. There was no safety as she understood it there, but with a faint murmuring sob she sprang across the room. She hesitated, listened, and, as the steps came nearer, she opened a door at the foot of the bed and disappeared.

The door of the room by which she had entered was pushed open more widely, and Earnshaw came in. He was as I remembered him in those days of 1900, travel-worn, but neither dishevelled nor disreputable-looking. His step was military, but it had something of the caution that marked his character. He had seen as many Boer interiors as I had, but, like myself, he seemed to find something individually interesting in this. He paused close beside me. His sight crossed mine, but there was no recognition of my presence in his eyes. He looked past me, appraising the objects in the room; delft-ware was not to his taste, but he examined some small brass ornaments with attention. He had scarcely been in the room twenty

seconds before a voice somewhere in the house called his name. Picking up a brass candlestick, he opened the other door, left it ajar, and departed without a glance behind him.

I could now see what the door had hidden; it was merely a shallow cupboard with a shelf about the height of a man's shoulder, upon which three books forlornly lay. The cupboard was, indeed, too small to harbour a human being with any comfort, and my unknown had disappeared completely. Where was she? Was she in the house, or had she left it by some secret way? I had heard of such happenings, and some explanation of the kind was necessary to account even for her presence in the house.

The tramping steps descended the stairs; they marched to within a short distance of the house, and there halted. There were sounds that for a while puzzled me; other men were moving quickly to and fro; there was a scraping of brushwood along the ground, the sound of chopping wood in the distance. Were they cutting timber for a fire? Then I realised what they were doing; the wood was wanted for a fire, indeed—they were going to burn down the house. For some reason—for its strategic position perhaps, or its employment as a harbour for secret meetings—the old homestead was considered too important to be left standing. I drew my breath sharply; I glanced at the cupboard, but there was still no sign of the hidden girl. There was a louder crackling below the window, then a roaring blast; then a puff of smoke obscured the sky and the trees; an acrid vapour filled the room. The men's voices were muffled by the noise of the fire, but they were still near, surrounding the house; there was no possibility of any person escaping without being seen, unless by a secret way. My senses began to leave me; my vision was obscured by the dense smoke, and my hearing by the increasing roar. I felt myself falling, the stout joists giving way beneath. . . .

III.

'My dear fellow, I'm most awfully sorry to have deserted you; it simply couldn't be helped!'

It was Earnshaw's voice bringing me back effectually across twenty years. My misgivings had no foundation; Earnshaw was hospitality itself, and I stayed with him that night. But it was not until the next morning that I alluded to my vision.

'What a fine piece of brasswork!' I said, picking up the candlestick and turning it between my fingers.

Earnshaw smiled. 'You know where I got it from?' he asked.

'Well, I didn't; but now I think I do.'

'That's a bit cryptic.'

I laughed; yet the dream, or whatever it

was, had made too great an impression on me to be easily dismissed. If I told Earnshaw what I had seen, he could at least satisfy my doubts as to where the candlestick had been found, and whether any living thing could have been hidden there. But I was also psychologically interested, and it was, from this point of view, important that we should present our respective evidence individually. An idea struck me.

'I have a whim,' I said, 'which I hope you will gratify without question. Write on this leaf of my pocket-book the outline of how you found that piece of brass, and let me give my version of what occurred on a paper which you shall provide.'

The beginning of my suggestion surprised him; at the end he was mystified, but he acquiesced readily enough. In his profession men learn that the way to find the meaning, if any, that lurks in what people want to tell you is to let them tell you their tale in their own way. So I set to work with my fountain-pen, and he removed the lid from the old inkstand. Our scribbling took but a minute or two; then we exchanged experiences.

My statement was the gist of what is narrated above; Earnshaw's ran as follows:

'I got the brass candlestick from a Boer farm at—during January 1901. The house was

to be burned down, and we went through it first.'

Earnshaw read my version thoughtfully, then glanced sharply at me. 'Queer thing!' he said at last. 'I suppose it was a dream. I don't recall any cupboard.'

'There's another thing that strikes me,' I interpolated. 'Do you remember the day? This is January, you know.'

'So it is. I don't, as a matter of fact, recollect the precise day—only the month. It may be significant—if you attach enough importance to your dream.'

'I suppose it was of the nature of dreams. Let us hope it is only that.'

He looked so uncomfortable that I half regretted my confidence. The knowledge, or whatever it was, could do no good now; but is not that often the case with psychic experiences? So far as we can judge, in many cases they serve no object. This argument, indeed, substantiates rather than vitiates my claim to have gone through such an experience in Earnshaw's study. You may call it a 'queer thing' if you like; I prefer to call it a vision, of which I may some day be fortunate enough to see the sequel, including the miraculous escape of the hidden refugee. But a further source of inspiration can scarcely lie in the single candlestick. Can any one help me by producing its neighbour?

THE MONTH: SCIENCE AND ARTS.

THE 'UNIT' CONCRETE COTTAGE.

IF the enormous number of small houses required in this country are to be built within a reasonable time and at a cost that will allow of their being let at commercial rents, it is abundantly clear that bricks (or stone) and mortar, in combination with wood floors and fittings, must be abandoned in favour of less expensive forms of construction. Many experiments have been, and are being, carried out with concrete houses, several of which were described recently in these notes. One of the latest schemes is known as the 'unit' method, whereby standardised houses are built in pairs with standard concrete blocks, their appearance being very similar to that of dwellings constructed of stone blocks. The outside walls are double, with an air-space of about 2 inches between them, the two thicknesses, which each measure $4\frac{1}{2}$ inches, being bonded together by steel ties—one every 3 feet for each alternate course. The floors are also of concrete, but those of the living-rooms, the bedrooms, and the hall are covered with a patent jointless composition which does away with the necessity for linoleum or oilcloth. Window frames and doors are of steel, and the windows are of the French type.

The front doorway has a porch in a recess under the first floor. One design shows on the ground floor a living-room 13 feet 1 inch square, a scullery 10 feet 7 inches by 7 feet 10 inches, a hall, a larder, and a coal-cellar; while upstairs are three bedrooms, the largest measuring $13\frac{1}{2}$ feet by 12 feet. This type of house can be built for a little over £500. Such abodes are proof against fire and damp, and cannot harbour vermin: moreover, their appearance is by no means displeasing.

A NEW LIFE-RAFT FOR SHIPS.

Although the need for life-saving appliances at sea is not so pronounced as was the case during the U-boat campaign, the pre-war risks from shipwreck still remain, and these will be added to for years to come by the danger of encounter with stray mines. The drawback to most of the existing forms of lifeboats or life-saving rafts is that the occupants are exposed to wind and sea, being drenched with spray in bad weather, and having no means of warming or drying themselves. Under such conditions deaths from exposure are common, even though assistance is forthcoming within a comparatively short period. The invention of a Hull man, Mr Reginald B. Parsons, bids fair to overcome this

danger, as in his life-raft the shipwrecked are completely protected from the elements, are plentifully supplied with air, and, if necessary, with artificial heat. Hitherto the chief difficulty has been to admit air into enclosed floating chambers while keeping out water in a rough sea, but Mr Parsons has solved this problem by an ingeniously contrived wire trap-door in the top of each chamber. A model raft, which has been exhaustively tested, takes the form of four steel tanks mounted at the corners of a square wooden framework. This contrivance has been tried on the Boating Lake at Hull with ferrets in the tanks. The model was turned over many times, and buckets of water were poured over the trap-doors, yet after more than an hour the ferrets were alive and unharmed. In the full-sized raft, to be constructed if, and when, sufficient financial help is forthcoming, it is proposed to make each tank eight feet square, giving accommodation for twenty-five persons, and provision for a wireless installation is to be made, where this is thought advisable. Ample room would be available for heating apparatus and for stores of food and drink. To prove the value of the invention, Mr Parsons and his partner are prepared to be taken out to sea in the roughest weather, and to be launched overboard in such a raft, there to remain for any length of time deemed necessary to demonstrate the efficiency of the contrivance.

EVERY MAN HIS OWN HAIRCUTTER.

Most men look upon having their hair cut as a necessary evil which involves a serious waste of time in these days when barbers' shops are crowded with waiting customers. Moreover, the risk of infection from the implements used in hairdressing saloons is quite appreciable. For these reasons the device known as 'Everyman's British Safety Haircutter' will be welcomed, in that it enables every man to cut his own hair. The invention consists in principle of two safety-razor blades mounted one upon each side of an ordinary comb, and is operated thus. The apparatus is placed vertically in the hair near the crown of the head, and is drawn downwards through the hair until the point is reached at which it is desired that the cutting should begin. At this point the haircutter is inclined to the scalp at about the same angle as a razor forms with the skin in shaving, thus enabling the blade on the side next the head to grasp the hair, and causing the overgrown locks to be evenly trimmed if the downward motion of the apparatus is continued. The hair may be trimmed to any desired length with this device, even to the extreme shortness produced by clippers at the back of the neck, the length varying with the amount of projection of the teeth of the comb beyond the cutting edges. The amount of projection is regulated by means of two easily adjustable screws; while by turn-

ing a little handle the device can be loosened and moved along to the coarse or the fine end of the comb as may be desired, the coarse end being used for thick hair, and the fine end for thin hair. A further movement of this handle opens out the apparatus for the purpose of cleaning or renewing the blades. The correct cutting angle is soon learnt by the novice, after which no difficulty is experienced in securing a smart appearance.

NEW FOOD-CONTAINER FOR THE TRENCHES.

During the late war one of the commonest difficulties with which the soldier in the trenches had to contend was that of preserving his food from the depredations of rats and the contaminating attentions of flies. To overcome this difficulty, Mr E. A. Dennis, who spent four and a quarter years with the N.Z.E.F., has invented a tin receptacle for food which exactly fits into an ordinary mess-tin. The ends of this food-container are provided with four lever-topped vessels, for butter, jam, milk, and condiments respectively, while the middle portion is available for other foods. At the end of a march the new food-receptacle, which is called the 'Campaigner,' could be taken out of the mess-tin, leaving the latter clear for the protection of the iron rations from rats. The system would also allow of jam, margarine, and milk being issued in lever-topped vessels which would fit the 'Campaigner,' thus appreciably simplifying the quartermaster-sergeant's duties, as, instead of having to serve out rations from bulk, he would simply issue the necessary vessels to each man every one, two, or three days.

ANOTHER 'ONE-RING' GAS COOKER.

Some time ago a gas cooker was described in these notes for which it was claimed that all the operations carried out on the ordinary type of cooker with the aid of a number of burners could be performed with the help of one ring. Similar claims are made for the 'Wifesjoie' one-ring cooker, in which, moreover, several novel features are embodied. In appearance the apparatus resembles a small table with a cast-iron top which contains the gas-ring. This ring is fixed on a swivelling arm; hence it can be moved to any part of the hot plate where extra heat is required. An oven is included in the equipment, also a fifteen-gallon boiler, which provides hot water for washing dishes, for baths, and other purposes. The apparatus can be fitted with long legs, which place the top at a convenient height, or it may be provided with short legs for standing on a table. A toaster and griller can be used simultaneously with the general cooking. The apparatus is said to consume 35 feet of gas per hour as a maximum, and to keep four pots boiling, or two pots boiling and the oven at cooking heat, on 30 feet per hour. If desired, an oil-stove of

the 'Primus' variety may be substituted for the gas-ring.

NOVEL PLAN OF BUILDING A DRY-DOCK.

Not only is the recently completed dry-dock at Pearl Harbour in the island of Oahu, Hawaii, one of the largest in the world, but the work of construction was carried out on entirely novel lines. A much smaller dock was originally proposed, and the intention was to construct it in the usual manner by building a cofferdam round the site to keep out the water. This plan, however, proved impracticable, as the strata under the bottom were not strong enough to withstand the upward thrust of the water trying to get in, as was discovered when an attempt was made to pump out the first section. To overcome this difficulty a floor of concrete, 6 feet deep, was laid under water and pegged down with piles. The pumps were then started again, but just when the concrete was beginning to show, the cofferdam collapsed, and the floor was forced upwards, involving the destruction of two years' work. After this failure it was decided to adopt an entirely new method of construction, while the length was increased to 1000 feet, and the width at the top to 138 feet. The depth was fixed at $32\frac{1}{2}$ feet to the keel blocks at mean high water. The system adopted involved the construction of the dock floor under water. This was done in sixteen cross sections. It was not found practicable to make the floor of the dock heavy enough to resist the upward thrust of the water by its own weight, but with the side walls resting on the floor, the weight would be sufficient to prevent the whole dock floating up when empty. This meant that the middle of the floor would have a tendency to rise, but would be held down by the side walls. Under such conditions it was necessary to make up the floor sections of steel girders, which were filled in with concrete to give them the greatest possible weight. Each section was built in a floating dock, but to lessen the weight during transit the spaces between the steel girders were not completely filled with concrete until after the section had been placed in position. The sections were lifted out of the dock and laid in position by what is referred to in the *Scientific American* as a cofferdam boat. This structure was long enough for its ends to pass over the ends of the floor section. When one of the sections was to be laid, the floating dock in which it had been built was sunk by admitting water, until the cofferdam boat could be floated over the floor section and attached to it. The dock was then sunk lower and the cofferdam boat with its burden floated out, to be subsequently towed to its correct position at the site of the dock under construction. Here, the bed having been already dredged to the requisite depth, and piles driven to give a firm foundation, water was admitted to the compartments of the cofferdam

boat until the floor section was sunk into place. At each end of the cofferdam boat there was a chamber large enough to accommodate the portion of the side wall belonging to the section. These chambers were pumped out dry, and the walls built in the usual manner. The compartments of the boat were then pumped until it rose sufficiently to be towed clear of the section, doors being opened to give a clearance for the side walls. The sections were laid with narrow spaces between them. For the floor these were filled under water, but between the side walls the work was done dry inside cofferdams. At the inner end of the dock a curved wall was built up of concrete blocks, keyed to the floor, to the ends of the side walls, and to each other. The outer end was, of course, filled by a caisson or hollow steel gate floated into position. It will be remembered that, to lessen the weight during removal, the floor sections were only partially filled with concrete; hence, to give weight enough to prevent the whole structure floating up, these were loaded with broken rock before the water was pumped out. The final operation was the removal of this rock and the filling of the steelwork section with concrete.

LARGE GRAIN-ELEVATOR.

Next to those consisting of oil, grain cargoes lend themselves to quick handling and easy storage better than any other type of produce. In the United States grain is handled on a very big scale, and according to the Wheat Export Corporation, as quoted in the *Scientific American*, New Orleans beat all other ports in the tonnage of grain handled during the war, the export reaching the grand total of 1,861,000 tons. This result was made possible by the public grain-elevator belonging to the Board of Commissioners of the Port of New Orleans, which has a storage capacity of 2,622,000 bushels, equipment for unloading trucks and barges at the rates of 20,000 and 6000 bushels per hour respectively, and for loading vessels at the rate of 100,000 bushels an hour. The storage-bins have the appearance of enormous wide organ-pipes, and they rise to a great height. As the grain is received at the ground, or water, level, it has to be raised to a distributing-floor over the bins—in fact, even considerably above this level, as it has first to pass by gravity through automatic weighing-machines, and thence by spouts to about a third of the bins. In addition to being raised, the grain has to be conveyed over considerable distances in a horizontal direction, and this is done by rapidly moving endless bands known as conveyers, the grain being simply fed on to the band by a spout. It is thrown off where desired by passing the belt round two pulleys on a travelling carriage, these forming a step in the band. A spout catches the thrown-off grain, which runs by gravity into the desired bin. In the New Orleans elevator the distri-

buting-floor is nearly 100 feet above the ground-level, and it is provided with five huge moving bands or conveyers. These throw off into shoots passing through the floor and delivering into enormous jointed spouts, the ends of which are fitted with wheels, so that they can be easily moved about to the openings over the bins. The bins number more than 300, and some of them hold as much as 12,500 bushels, while smaller ones have capacities of 2900 bushels. The grain from up-country reaches the elevator in river barges and railway cars, the former being unloaded by a pneumatic elevator which works on the vacuum-cleaner principle, and is so constructed that it readily adapts itself to the rise and fall of the water. Railway cars are run direct into the main building, and their contents fall by gravity into the elevator 'boots,' whence they are raised to the necessary height. Ships are loaded through shoots into which the grain is thrown by conveyer-bands. Ships and barges lie along both sides of a jetty out in the river and parallel with the shore. Surmounting this jetty, and raised high above the ground, is a gantry containing conveyer-bands for loading and discharging. From a tower in the middle of the gantry four conveyer-bands, each having a capacity of 25,000 bushels an hour, carry the grain to or from the main building. It is necessary to cool the grain when its temperature exceeds 95 degrees, and this is effected by raising it to the top of the building and dropping it, or by using a cooler bin. Steel and reinforced concrete have been used exclusively in the construction of this huge elevator, and all the machinery is driven by electric motors.

A CARAVAN DE LUXE.

Luxurious horse and motor caravans are by no means unknown in this country, but it is doubtful whether any have been so elaborate as one recently built by a well-known American motor-car manufacturing company for the use of its executive. The body is mounted upon a two-ton motor-lorry chassis, and it contains sleeping-berths for four persons, in addition to sleeping accommodation for the driver, which is provided by converting a special seat into a bunk at night. Under each berth is a locker for clothes, while a complete kitchen equipment is arranged at the back of the vehicle. At the front of the body are two cross seats which accommodate the driver and those who wish to view the scenery as they go along. Various lockers under the body are provided for tools and other items, and here also are the water-tanks. Electric current for twenty-five lamps is supplied by a separate motor and dynamo in conjunction with a storage-battery. A tender in the shape of a motor-bicycle, which may be used for subsidiary journeys off the main track, is carried at the back of the body.

A SIMPLE PREVENTIVE OF SEASICKNESS.

When first heard, the statement that seasickness can be prevented by stuffing the ears appears almost incredible. Such, however, is the belief of Major Lemon, a medical officer in the United States Army. Starting from the well-established physiological fact that the semi-circular canals of the inner ear have to do with the maintenance of the equilibrium of the body and the co-ordination of its muscular movements, he came to the conclusion that the violent motion of a vessel in a rough sea might give rise to sensations in the ear which would produce seasickness. To avoid these, he hit upon the expedient of packing his ears with sterile gauze, and both in his own case and in that of others whom he induced to try the experiment the results proved to be highly satisfactory. The 'remedy' is certainly a simple one, and the matter appears to be worthy of the fuller investigation and research which Major Lemon proposes to make.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE PEAT-MOSS.

PALE stars in shrouds of moon-mist lie in every
stilly pool;
A weary wind is wailing 'mong the pines a dirge
of dule;
It brings upon its drooping wing the heather's dewy
breath;
The sea is crooning low a mocking song of love and
death.

When here we plighted troth, the glowing heather's
breath was wine;
The fairies clinked their tiny spears in every wind-
kissed pine;
The placid sea smiled in the sun as if it blessed the
vow—
Its music held no menace then; but, ah! it mocks
me now.

The moonlit moss-hags gape like graves that hunger
to be fed;
The ghostly glimmers in the pools are tapers for the
dead;
The solemn pine-trees sway in grief above an unseen
bier,
And I am desolate, and weep for one that kissed
me here.

P. TAYLOR.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the *writer's Name and Address written upon them IN FULL*.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

MR PHIPPS OF 'THE OLD FIRM.'

A JACOBITE TALE.

By G. APPLEBY TERRILL, Author of *Within Touch*.

PART I.

I.

A FEW miles short of Canterbury I brought the sorrel to a stand, partly because he was no credit to his posthouse, but dead weary already, and partly because here was a nook that long ago had won my fancy. It was a deep cup, with pastures and woodlands for its sides, and a nice space of cultivated fields at the bottom, where also was a prosperous farmhouse.

The sky was blue, save for one great tumble of white cloud to the south; and, despite the lateness of the season, I thought the place looked as well as ever it had. It was very English, very homely. Had the farmer been visible I should have enjoyed to ask him how he had done with his harvesting and his autumn ale, and whether he found the flat over-moist for his grain of a wet summer. The height of the slopes gave an air of complete seclusion to the scene; and perchance it was this that attracted me as much as anything, since a liking for seclusion was grown to be a second nature with me.

A dusty tradesman on a jaded hack I was, this October afternoon of 1696, near to the finish of the eighth secret visit I had made to England since the winter of 1690 for the purpose of trying what I could do in the matter of flinging the Prince of Orange off the throne, and putting back King James thereon. Seven times I had returned to France unscathed and unpursued, and with some promising business accomplished, so that our little court there was wont to call my good fortune marvellous. None deemed it so marvellous as did I myself, however, who alone knew of a certain weak spot in me, very liable to cause disaster.

Often I thought on this weakness with self-reproach: sometimes with keen shame, as when my poor king at St Germain would lay his hand on me—a hand become tremulous from the sorrows of exile—and declare I was the most proven, trusty friend that ever heartened his sovereign in adversity.

Not that I had swerved a hair in my faithfulness to him whom his people had used so ill. No, indeed! But always during my last hours

in England I would run a risk I should not have. Coming coastward, with letters in my keeping that were much more to be guarded than my life, since their discovery would peril the lives of the writers, I yet, for my own ends, took a flirt with danger. I could not resist so to do, though all I ever gained was a smart of freshly stirred sadness, which made it truly difficult for me to come with the bright mien I wished into the presence-chamber of St Germain, where was mournfulness enough and to spare.

II.

Ruth, my wife, was the reason of the weak spot in me.

I had been contemplating the farm scarce a minute, when she was vivid in my thoughts again.

We were wedded in '86, and surpassingly happy for two years—that is, until the Prince of Orange came. Then all the Whig spirit in her, all the hatred of the king and of his late brother's memory, which her malcontent family had fostered in her, broke forth. I had known of this defection when I wooed her, had known even that she pondered vengefully on the death of her cousin for treason in '85; but, seeing her so tender to me, and she but a child still, I had thought to chide and coax her from these ways.

With my utmost wit I strove to do this now. I failed, and that was but a small part of my discomfiture. To my bitter astonishment, she was suddenly changed towards me by the turn of the times, carried to wild excitement by the triumph of her side. I heard her, who was so dear to me, reprove me because I turned not false traitor, call me traitor to her and to all right-minded folk, upbraid me with cruel gibes or angry tears, and at length vow steadily that she hated me as much as the king, there being nought to choose betwixt us. When His Majesty was escaped over to France, and I was on the point of joining him, I entreated her—how I entreated her!—to bear with me and come with me; for I could not harden my heart to bring her away by force. But, in the hottest anger yet, she bade me go alone, and not think to see

her more, since my wilfulness had divorced us beyond mending.

On my first return to England I learnt that she was dwelling at my house of Shepherdsholme in Kent, which her kinsman Lord Somers had separated by some argument of the law from the rest of my confiscated property, and given to her as her own right. This house, by strange fate, I had never seen, His Majesty having made me a birthday gift of it on the very day of the Hollander Prince's landing, which gave me something else to think on. But I knew where it lay—and that not above six miles from the beach whence I should ship to France—and I was sure that no servant of mine who might be there would betray me. So on the night of my embarkation (a job needing darkness) I rode aside to it, and, my knocking being answered by a stranger servant, begged that my wife would see a Mr Phipps. And presently she came to me in the small room where I waited alone.

For a moment she was softened, even letting me kiss her, and asking with some awe how durst I venture into England. Yet anon, when she had it from me that I was persuading men back to the king, she stood aloof from me in a mood that most quickly became a storm of rage. Beginning with a taunt ill suited to her sweet lips, namely, that 'the lanthorn-jawed old bigot over the water [His Gracious Majesty] would fool me to the block,' she added that such would serve me justly and be best for the nation, as I was bent to enslave and ruin it. Then, breathing fast, she cried that, as she lived! I should not ruin it—that she saw her duty—that her serving-men should take hold of me and carry me to the magistrate. And she spoke with such a quivering of her body and such a marked danger-light in her eyes that forthwith I made for the door of the chamber, getting at my pistols in belief that I should have to fight a way to my horse, and at the same time feeling dumbfounded that this could be my Ruth, that was used to lean fondly on my bosom and show me all the love in her eyes.

But ere I was at the threshold she was sunk down and weeping agonisedly. So I turned back, remaining with her an hour, which was all the time I could spare. For a while she was contrite. Then her manner grew very cold; and, going with me to the hall to let me forth, she would neither kiss me nor wish me to come again; and before my foot was in the stirrup she shut the door. I heard her turn the lock at once, as if she were well rid of me and glad she could bar me out. I was to hear that prompt locking many times, and the echo of it would go with me to France, keeping my heart desolate until I was preparing to cross to England again.

III.

Now, as I have said, I was completing my eighth venture. I had spent two months in

London, chiefly tampering with affairs of the fleet, which at least should have had grateful recollections of the king; and I had stifled indoors for a week at a stretch, and gone a-visiting ministers by their cellar stairs with sea-coal and stubble on my cheeks. But here in the pure breeze of Kent I showed my own face, passing along in the character by which I was become known commonly, that of Mr Phipps, a merchant out of the north country—in a plain coat and plainer peruke, and with my sword strapped to the little trunk behind my saddle in so useless and simple-minded a fashion that none dreamed how ready lay a pistol in either pocket of Mr Phipps's skirts. And none save a highway thief was like to find out.

Though Ruth had such a large share of my thoughts as I lingered by the farm, I yet received some profound satisfaction from considering how deftly I always avoided the notice of the authorities. For many weeks past I had been busy under their noses, daring more than ever before; yet I had left London at the hour I wished, and now was safe beyond their sight, unsuspected, unthought of.

I patted the sorrel's neck and laughed aloud, gaily.

Had I not warranty for gladness? There were signatures of huge value written against certain of the letters in my breast. Two of them the king himself—though in one of those excitable, sanguine humours which on occasions relieved his despair—had declared I should not get. And I was going to see Ruth this evening.

Though I could hope for nothing but to part from her presently with the wretchedest pain, none the less, as ever was the case, I was almost beside myself at the prospect of standing before her, of taking her hand, perhaps, if she were very merciful, of putting my arms for an instant around her.

She was at home. I had been careful to discover that. Not again, since an unforgettable night three years before, when, reaching Shepherdsholme, I was told she was in London, had I laid myself open for a disappointment so terrible. Yes, she was at home—yet far from expecting me. For, though I held myself despicable for it, never did I let her know I was in England till I was in the act to leave, just half-an-hour's night-galloping from my sloop; I could not forget the danger that once had shone in her eyes, and (what was yet more ominous) would often again have shone, it seemed to me, had she not veiled it.

My reverie taking this colour, I lost the mood for laughter. I was accustomed to Ruth and my letters agreeing ill in my mind, but now of a sudden they clashed so violently as to nauseate me. These vital signatures, which I had enticed only by the most vehement assurance of my wariness, the most solemn pledging of my honour! Whither was I carrying them!

I felt my hand clench on the rein and my face go hot. But one thing was certain: I could not force myself from England without a sight of Ruth. Ruth!—two years my mate, then these eight long years so harsh a stranger that it was past belief she was ever my lover. Ah, well, she was the lover of no one else. There was true solace for me in that; and I hoped she knew it was the same with me, despite her several fleers that she would wager some French damozel had took me from her.

Recalling this unreasonable logic, I smiled, so varying was my temper, thanks to her, this afternoon. Then, with a last glance round the valley, I roused the sorrel and set him trotting towards Canterbury and the 'Blue Stag' posthouse.

IV.

The road was good and his step more willing, and soon the steady click-clock of his hoofs got me to whistling and humming softly; for, whatever might be the quality of my thoughts, a kind of careless elation would ever take me at intervals when my horse was beating a measure through a fair country-side. Thus I played with ilits and snatches; and I am afraid that to more than one air I idly fitted some words of compliment to 'Mr Phipps of "The Old Firm"' and his skilful methods of business, since I exulted in my work.

The 'Blue Stag,' a quiet house that suited me, I usually found empty of any traveller of substance. To-day, however, when I walked into the room where I was wont to eat a meal, I came upon an occupant—a large, stout man sitting before two bottles of wine, his riding-cloak thrown back somewhat, showing a rich blue suit. He stared across the bottles at me in plain annoyance, then shifted his gaze to the bar of the door as if wondering why he had forgot to fasten it. Finally, with a sigh, he folded a letter he had been reading, and seemed to resign himself to the intrusion of mean company, though he could not suppress a discourteous greeting as he surveyed the dust on me.

'My man,' said he, 'are you that blackguard express from London that has hired all the horses and drove me to find one at this posthouse? But I am before you here. The chestnut in the shed is mine. Touch her, and you shall suffer, whoever your master be.' And he eyed me very grimly as he sat back, a trifle puffed from his speech.

But I heeded not his words, for I knew him instantly, and all my business faculties were alert. Here was a fine piece of luck in my path—an old rustic Tory of uncommon influence, who had meanly gone over to the Prince of Orange, and ever after had seemed to regret it and to balance unsteadily between him and King James. But, having wide estates and a selfish, timid mind, he could be induced neither to send word to St Germain nor to receive an envoy there-

from, though it was often bruited he was about to do both.

I shut the door and sat down in the window-seat.

'To-day is liker summer than October,' I said. 'A queer whim of the weather, Sir Jacob Bristowe.'

I saw that he was surprised at my telling him his name, and also resentful of my familiar manner.

'I know most faces in these parts,' said he, 'but not yours. Who are you?' Which was what I wanted.

'My name is Phipps,' said I; 'and my trade might be worth your hearing.'

He put forth his lip with contemptuous indifference, and poured wine into his glass. 'What is it?'

I stood up and walked to his table, looking at him very gravely. 'Declare in all honour that you will put me from your memory if we agree not to trade, and I will tell you,' I said; 'not otherwise.'

Whereupon his ill-humour was jolted afresh. 'Trade!' he said, gaping at me and flushing with spleen, and attempting to glare me out of countenance. 'I trade—with a chance pedlar-fellow that'—Then, perceiving no anger in my eyes, but rather mirth, he broke off, very puzzled. 'Is it the wine-running?' he asked.

'First,' I replied, 'it is the vowed word of Sir Jacob Bristowe.'

He frowned me over from top to toe, and, getting no cringe out of me, muttered something anent 'a brazen rogue.'

Whereat he got his cringe in sooth, I bending quickly to hide my merriment.

'Perhaps I could do with a few casks,' he said cautiously, 'if you were a safe man. Um—ye-es, I give you my word of honour.'

Though his honour was certainly not of the best, this sufficed for me now. I sat down by him, laying aside my hat, which, though that was not my intent, soothed his dignity enormously.

'You are a trader?' said he, quite amiable.

'A merchant,' I replied. 'I am in England representing "The Old Firm."' I waved my hand Channelward.

"The Old Firm"? A shadow of uneasiness crossed him.

'Ay, the trusty old firm—James & Jamieson, of St Germain.'

'My soul!' he exclaimed, starting up like a fat, scared boy, his heavy face pale in a second. 'What have I let myself in for?—Go away!' he muttered, trembling. 'I will hear no more.'

'You have let yourself in for nothing,' I said. 'Like you, I am prepared to forget this talk. So you will take no hurt from listening.'

I motioned to his chair, and, after hanging off a while, he sat again, emptying his glass and folding his mouth as one who meant to be immovable.

'My firm,' said I, 'will be very generous in the matter of debts—heavy, black debts, mind you—which this realm owes it. It will forgive and forget every single one, hold rancour against no man, in return for a trivial sum.'

'A trivial sum?'

'Three crowns,' said I. 'Trivial enough to you folk who bestowed it on a stranger. Three crowns; and all who contribute to this settlement of the *Bill*'—

'I will not see King William settled bloodily. I will not see him harmed,' he interrupted with real decision.

'I am of no plot party, sir,' I replied with a touch of stiffness. 'I speak for the head of the firm. Pack your Dutchman back to Holland; that satisfies us. Now mark you—all who contribute to the payment of the three crowns will get a most handsome return for their honesty. And all wise men are contributing; for it is certain that "The Old Firm" must quickly come back.'

v.

For half-an-hour I urged him, pausing only while the post-keeper entered and set down a refreshment for me; and a dozen times in that half-hour I saw Sir Jacob incline this way and that. At last he jumped up again, with a weird choking sound, and throwing a glance at the door to make sure it was closed tight, swung round on me in a veritable fury.

'Perish you!' he cried, 'for this evil trade of yours.' He clenched his fist at me. 'Pah! what a trade! To sneak into England and lure men from their uprightness! To bring them to ruin and death; to wither the lives of their children!'

For a moment he silenced me. Not by his rage or his reasoning, but because his words were words that Ruth had spoken, and so hit me sadly. Then I recalled myself.

'Sir,' I said, 'I do sneak and lure, and I risk my own life pretty badly. But it is because, until the end, I stand true to my king—the man who fought the Dutch for us, the man who loved our navy, the man who was too honest to hoodwink you, wherefore you drove him out, robbing him of his very daughters, and nigh breaking his heart.'

With which flourish I drank a beaker of wine to St Germain and turned to my meal. From the corner of my eye I noted Sir Jacob shifting his feet and rubbing his chin with his knuckle, and very soon he was in his chair once more.

'Is he—King James—much altered in appearance?' asked he with furtive curiosity. 'And what of the young gentleman, the Prince of Wales? What think you of him?'

At that I abandoned my food, and twenty minutes after I had Sir Jacob won over.

'But a letter—a letter!' he protested. 'I dare not give you such, Mr Phipps. You cannot

think I would. I have no proof that you are what you say.'

With a sigh, being ever reluctant to shed the cloak of Mr Phipps, I took my commission from my wallet. 'You would recognise His Majesty's hand?' I asked.

He nodded.

'That is all writ by it.' And I passed the paper to him.

He read a few lines, and then his brows went up high, and laying it on the table, he scrutinised me, at first blankly, but soon with a smile that rather drew me to him.

'My lord viscount,' he said, uncovering and standing, and holding forth his hand, 'I must ask pardon for rough words; but indeed your lordship makes a most excellent loose, adventurous fellow.'

Whereat we both laughed and shook hands; and very calmly he got to writing his letter, though wishing first to bar the door, which I would not hear of, as being just that indiscreet move which might arouse suspicion.

But when his note was in my wallet, and I about to go, his placidness left him, and he gripped me by the arm, actually with tears springing to his eyes. 'My lord,' he said pleadingly, 'tell me again it will be safe—that there is no chance it shall come into any hands but the right!' His big face worked with apprehension. 'You have so cajoled me, my lord, that I know not whether I have done well or madly. And I have three daughters, quite young! For their sake you will take strict care of it?'

I patted his arm. 'It is as secure as if already at St Germain,' I said.

'Ah,' replied he, his tone somewhat reassured. Then, mopping his forehead and cheeks hastily with a brilliant kerchief from the Indies, he added, 'I am no downright brave man like you, my lord. Faith! and you are light of spirits with it all. Perchance—and I trust so—you have lost little by your loyalty?'

I thought of Ruth. 'Only the world,' I said with a moody smile, setting my hat on.

vi.

The French mare from the 'Blue Stag' took me smartly out of Canterbury in the gathering twilight, and being instantly affectionate towards me, and proud of her paces, would have borne me at a gallop had I not held her. Whereupon, to give play to her sportiveness, she was pleased to shy frantically across the road at the sight of every third or fourth clump of bush we approached, to the near unshipping of Mr Phipps's trunk.

Between these whiles, however, she trotted faultlessly, and many a refrain I hummed, with extra zest inasmuch as I was gratified by my latest bit of work, and also inclined to welcome the salt taste of the Channel which was already

in the air. For, although Sir Jacob had named me a brave man, there were occasions—such as when, newly landed, I rode into the shadows of London, or when I lay wakeful at night in my lodging there—sundry occasions on which a sudden, nasty fear seized me that my courage and cunning were both on the point to desert me. These fits were short, but bad enough, truly; and England at this time, still a-ring with the late silly murder plot, being no pleasant place for me, I should feel some relief to be out of it despite my hunger for Ruth.

So I sniffed the saltiness eagerly, and, the wind coming from France, was assured that the sloop would be off the beach at her proper hour—nine o'clock.

After a few miles, since, alas! I durst not go to Ruth too long before the sloop was at hand to flee to, I walked the mare; and my thoughts reverting to Sir Jacob and his entreaties and his tears, my falseness in visiting Shepherdsholme with my pack of letters stung me deeper than ever before. But I must have that sight of Ruth!

Staring into the darkness, my teeth set, I pondered. The mare had taken me perhaps a mile farther, when a most simple way out of the trouble occurred to me, one that seemed in no wise foolhardy and should have been my custom years ago. And thereafter I gave my reflections to Ruth with an easy conscience, and wondered

much whether she would take the little string of rubies I had for her, or coldly push them back to me, as was the case with my last gift.

For a while I but walked the mare, to her great impatience; and though the night was so early, I found it marvellous quiet. A man or two moved in the villages, but out in the blackness of the road I met with no traveller, nor heard sound of any, save that now and then far behind me I caught the tread of some pack-horses, as I took them to be from their pace being little more than my own.

At length I went atrot again, noting that the light wind was increased and gusty, though hardly enough to presage an awkward sea-crossing; and something past seven o'clock, with my heart beginning to leap beyond bounds for joy, I swung off the main road into the three-mile-long lane that led to Shepherdsholme—and half-way through it I drew rein under an old tree, dead of lightning, that was called 'Gospel Oak' (Ruth herself had told me), and had strange writhing branches which I could discern by peering carefully.

Out of the saddle, my arm through the mare's rein, I made a small pit in the mould beneath the tree, put my wallet therein, and covered it up—to be come for later. There it should be safe from every one.

And now—Ruth! Ruth!

(Continued on page 91.)

LEAVES FROM A CATALOGUER'S WALLET.

I.—GENERAL LA FAYETTE'S 'MOTHER.'

By W. ROBERTS.

WE know, from his own confessions, of the happy facility with which Mr Artemus Ward's wax 'figgers' could be manipulated to fulfil any sudden call on the part of his patrons for new celebrities. But life would be a monotonous business if facility was confined to any one trade. Facility, in fact, has been the salt of our national life, and without it we should now be under the heel of the Hun. Adaptability (which is perhaps another form of facility) of a very varied character will be especially familiar to those who have studied the history of portraits, engraved and otherwise. It is well known, for instance, that the portrait of a Mrs Hodges has done duty as Mrs Fitzherbert, and again as the Princess Caroline of Brunswick; that a portrait of Lamotte, the French spy, served also as a portrait of the Rev. Mr Hackman, who shot Miss Ray; and that Faithorne's portrait of Endymion Porter has passed muster as Robert, Earl of Essex. In most cases the 'fakers' have not even gone to the trouble of touching up the engraving—for example, adding a different beard or altering the shape of the face—but have contented themselves (such was

their happy belief in human credulity) with simply putting a fresh inscription on the print. Curiously enough, the prints with the false inscriptions are usually no less valuable than those with the true. Demand creates supply; and in the case of oil-paintings, the supplying of 'ancestors' is too profitable an industry to be neglected. If newly-rich people with plenty of money to spend, and with not too exacting a taste, must have portraits of their real or imaginary ancestors, there is sure to be some one happy to oblige them. It may not be pleasant for an ancestor-worshipper to be told that he is offering incense at the wrong shrine, or that he is paying homage to the memory of a man who was no credit to his family, and perhaps even a disgrace to his country; yet the devotee is always willing to risk the chance of such unpleasant possibilities.

There is much to be said in favour of collecting portraits of great men and beautiful women, painted or engraved by famous artists. These things are genuine chapters of history, a kind of conquest over death and time. And fascinating as are the portraits of celebrities,

those of their parents are scarcely less interesting. Portraits, for instance, of the parents of Shakespeare or Ben Jonson, Voltaire or Cervantes, might aid us in coming to some conclusion as to whether or not these men derived their genius from their progenitors. Rembrandt's portraits of his father and mother are fairly conclusive evidence that one of the greatest artists who ever lived owed very little of his genius to either of his parents. But portraits may be collected for various reasons, national as well as individual. Capitals like London, Edinburgh, and Dublin have specialised on national lines with exceedingly interesting results. Galleries in nearly every state in North America have of recent years been keen collectors of portraits and pictures by native artists—particularly portraits of men who have contributed to the building up of the great republic, and more especially men who had a hand in the famous Revolution. Perhaps no man not born in America appeals more forcibly to the American imagination than the Marquis de La Fayette, and to him successive generations of Americans have paid due homage. Engraved portraits of him are to be found in every collection, private and public, throughout the States, and of monuments to his memory there are many.

A national affection for a great man does not necessarily stop at the man himself; it almost automatically extends to his parents. And what could crown a fine collection of pictures in an American gallery with greater glory than a portrait of La Fayette's mother? It would be perfectly reasonable to argue that Madame de La Fayette, like all the other great ladies of her time, sat for her portrait; and it is easy to realise with what satisfaction an American would add her portrait to his collection. Such a portrait, or what claimed to be such, was offered some years ago to a famous collector (since dead), was purchased by him, and for some considerable time hung among his splendid collection of old masters. And it might still be hanging there but for a curious and interesting series of circumstances which robbed it of the faintest claim to that honour.

The picture was ascribed to Nicolas de Largillière, and on that point there could be no two opinions. Largillière was born in 1656, and lived until 1746. As he painted portraits of the leading men and women in France of his time, and as a portrait of Madame la Marquise de La Fayette occurs in a list of his works in the *Dictionnaire général des Artistes de l'École Française*, by Bellier de la Chavignerie, there was so far no reason to question either the name of the artist or that of the lady in the picture. But when it became a matter of collecting some biographical details concerning the mother of the great La Fayette, what should have proved an easy task seemed full of elusive uncertainties. Her name was not to be found

in any of the historical memoirs of the time; she was scarcely mentioned in such genealogical publications as were to be consulted in London. Even the dates of her birth and death, which most will admit are important facts in any biography, were not forthcoming. After many and vain efforts, an appeal for information was made to the gentleman who inherited the La Fayette seat at La Grange, the descendant of the fifth Marquis de La Fayette, and by him every particular was courteously supplied. The mother of the famous Marquis de La Fayette, a great lady and rich heiress, lived entirely secluded from the Court and fashionable gatherings of Paris. She was Marie Louise Julie de La Rivière. Born about 1737, she married at the age of sixteen or seventeen her kinsman the fourth Marquis de La Fayette, became a widow at twenty-two, and died about 1768, when her son, who was destined to figure so conspicuously in history, was a child of eleven.

A mere glance at the dates will show that the future Marquise de La Fayette was a girl of about eight or nine when Largillière died in 1746; and so this portrait, if painted by Largillière, could not represent the mother of the great La Fayette, for the portrait showed a lovely and evidently very lively young lady of over twenty years of age. Then it must be a portrait by Largillière of an earlier Marquise de La Fayette, the grandmother of the general, argued the venders of the picture when asked to explain the discrepancy as shown by the dates. The canvas had the date 1730 on the back; but, as a matter of fact, the grandmother was married in 1708, and in 1730 would have been a matron of at least forty years of age, and not a frisky young thing of twenty or so. Moreover, as all the family portraits had been most religiously preserved at the La Fayette seat at La Grange, and as every one was known to La Fayette's descendant, it was curious that an important portrait of the Marquise, entirely unknown to the family, should suddenly come to light and be exhibited in London among other pictures forming part of a great collection.

It having been proved that the portrait was neither of the mother nor of the grandmother of the great La Fayette, it was not necessary to go any further in the matter, so far as the owner was concerned. But inquiries of this kind are never satisfactorily disposed of until every problem has been sifted to the bottom—to prove a negative is only to get half-way to the bottom. Fortunately, in this instance it was not only easy to prove that the portrait did not represent a Marquise de La Fayette, but that it did represent a Marquise de Migieu; that ever since it was painted, nearly two centuries ago, it had been in the possession of a member of the *ancienne noblesse* of France; and that it was at a château in Savigny-les-Beaume (Côte d'Or)

until a short time before it found a temporary home in the collection of an American millionaire. It was seen at the château by an eminent expert, who noted the date 1730 on the back of the canvas. The owner was anxious to sell the picture, but was equally anxious to suppress all record of its *provenance*. Eventually the picture was sold, doubtless at a good price, for fine examples of Largillière's work are not picked up every day. And so by some curious chain of circumstances, which doubtless will never be pieced together, on the road to Paris, or perhaps when it got there, the beautiful

portrait of Madame de Migieu not only lost its identity, but acquired a new and much more 'selling' name!

It is perhaps hardly necessary to add that the so-called portrait of the mother of La Fayette never figured in the catalogue of the American millionaire's collection, and that it quietly passed back to the vendor from whom it was purchased. But counterfeits of the kind are not easily killed; and even now the picture may be adorning some transatlantic gallery as that of the mother of the general who contributed so much towards the freedom of the United States of America.

THE PARTS MEN PLAY.

By ARTHUR BEVERLEY BAXTER, Author of *The Blower of Bubbles*, *Merrie Gentlemen*, &c.

CHAPTER V.—THE OLYMPIANS THUNDER.

I.

IT must be admitted in defence of Lady Durwent's dinners that, at any rate, the conversation was *unusual*. The art of matching mind against mind, of summoning thought and wedding it to speech, the interchange of spirited controversy which marks the meeting of active brains, was at least essayed at Chelmsford Gardens.

Like other social arts of past ages, conversation has become the accomplishment of the few. The chatter that has taken its place, the poverty-stricken diet of music-hall humour never rising higher than a play on words, the intimate inanity of exclusive Society—these are signs of our development no less than the thinly veiled indecencies which muddy the talk of the ultra-smart set.

Among the few benefits accruing from the war, we can at least place the temporary interruption to the tyranny of the commonplace. The decade preceding 1914 was a prolific one—it is doubtful if we shall ever see another period so productive of powerful nonentities.

With all its faults, war stirred the sluggish brain of the world—and supplied a genuine topic of conversation.

II.

Lady Durwent was blessed in the possession of a cook whose artistry was beyond question, if the same could not be said of the guests to whom she so frequently ministered. She was a descendant of the French, that race which makes everything tend towards development of the soul, and consequently looks upon a meal as something of a sacrament. She prepared a dinner with a balance of contrast and climax that a composer might show in writing a tone poem.

On this eventful evening, therefore, the dinner-party, stimulated by her art and by potent wines

(gazing with long-necked dignity at the autocratic whisky-decanter), rapidly assumed a *crescendo* and an *accelerando*—the two things for which a hostess listens.

H. Stackton Duncleley had held the resolutionist in a duel of language—a combat with broadswords—and honours were fairly even. The short-sleeved Johnston Smyth had waged futurist warfare against the modernist Pyford, while the Honourable Miss Durwent sat helplessly between them, with as little chance of asserting her rights as the Dormouse at the Mad Hatter's tea-party. The American had held his own in badinage with the daughter of Italy on one side and his hostess on the other, the latter, however, being too skilled in entertaining to do more than murmur a few encouragements to the spontaneity that so palpably existed.

'Let me see,' said Lady Durwent as the meal came to a close and the butler looked questioningly at her. 'Shall we'—she opened the caverns of her throat, producing a volume that instantly silenced every one—'SHALL WE HAVE COFFEE IN HERE OR IN THE DRAWING-ROOM? I suppose you gentlemen, as usual, want to chat over your port and cigars alone.'

H. Stackton Duncleley protested that absence from the ladies, even for so short a time, would completely spoil his evening—receiving in reward a languorous glance from Lady Durwent. Johnston Smyth, who had done more than ample justice to the wines, offered to 'pink' at fifty yards any man who would consider the proposition for a moment. Only Norton Pyford, in a sort of befuddled gallantry, suggested that the ladies might have sentimental confidences to exchange, and leered amorously at Elise Durwent.

'Well,' said Lady Durwent, 'I am sure we are all curious to hear what Mr Selwyn thinks of England, so I think we shall have coffee here. Is it agreeable to every one?'

Unanimous approval greeted the proposal, and,

at a sign from the hostess, cigarettes, cigars, and coffee made their appearance, with the corresponding niceties of 'Just one, please,' 'Well, perhaps a cigarette might be enjoyable,' 'I know men like a cigar,' 'After you, old man,' and all those various utterances which tickle the ear, creating in the speaker's breast the feeling of saying the right thing and doing it rather well.

Throughout the dinner the daughter of the house had sat practically without a remark, and even when chorus effects were achieved by the rest, remained with almost immobile features, merely glancing from one to another, momentarily interested or openly bored. Several times the American had looked furtively at the arresting face, marred by too apparent mental resentment, but the barricade of Johnston Smyth's angular personality had been too powerful for him to surmount with anything but the most superficial persiflage.

He had watched her take a cigarette, accepting a light from Smyth, who surrounded the action with a ludicrous dignity, when she looked up and met his eyes.

'Mr Selwyn,' she said, speaking with the same rapidity of phrasing that had both held and exasperated him before, 'we are all waiting for the verdict of the Man from America.'

'Over there,' he smiled, 'it is customary to take evidence before giving a verdict.'

'Good,' boomed the resolutionist; 'very good!'

'Then,' said Lady Durwent, 'we seven shall constitute a jury.'

'Order!' Johnston Smyth rose to his feet and hammered the table with a bottle. '*Oyez, oyez*, you hereby swear that you shall well and truly try'—

'Can't,' said Norton Pyford, pulling himself up; 'I'm prejudiced.'

'For or against?'

'Against the culprit.'

'My discordant friend,' said Smyth, producing a second bottle from an unsuspected source and making it disappear mysteriously, 'means that he is prejudiced against England. Am I right, sir?'

'Not exactly,' drawled the composer. 'I don't mind England—but I think the English are awful.'

'That is a nice point,' said Lady Durwent.

'Ah,' broke in Madame Carlotti, 'but, much as I detest the English, I hate England more. *Nom de Dieu!* I—a daughter of the Mediterranean, where the sun is so rarely a stranger, and the sky and the water it is always blue. In Italy one lives because she is alive—it is sufficient. Here it is always gray, gray, always gr-r-ray. When the sun comes—*sacramento!* he sees his mistake and goes queek away. Ah, Signor Selwyn, it is *désolant* that I am compelled to live here.'

A roar of unfeeling laughter greeting her familiar plaint, Madame Carlotti took a hitch in

her gown and reimprisoned some of her person which had escaped from custody.

'Then,' said Johnston Smyth, 'if we are all of a mind, there is no need to have a trial. You have all seen the accusation in Mr Selwyn's eye, you have considered the unbiassed evidence of the lovely Carlotti'—

'But jurors can't give evidence,' muttered Mr Dunckley.

'My dear sir, I know she can't, but she *did*,' said Smyth triumphantly. '*Oyez, oyez*—all in favour'—

'But,' interrupted the American, 'are we not to hear any one for the defence?'

'No,' said Smyth, who was thoroughly happy as a self-constituted master of ceremonies. 'No one would accept the brief.'

'Then,' said Selwyn, 'I apply for the post of counsel for the defence, for in the limited time I have been in your country I have seen much that appeals to me.'

'Of course, it is a well-known fact,' said Dunckley sententiously, 'that American humour relies on exaggeration.'

'No, no,' said Johnston Smyth, hushing the voices with a *pianissimo* movement of his hands, 'it is not humour on Mr Selwyn's part, but gratitude. In return for Christopher Columbus discovering America, this gentleman is going to repay the debt of the New World to the Old by discovering England.'

'SHALL WE HAVE SOME PORT?' said Lady Durwent, opening the sluice-gates of her vocal production.

III.

'Speaking of America,' said Mrs Le Roy Jennings a few minutes later, Johnston Smyth having sat down in order to do justice to the wine of Portugal, 'she is in the very vanguard of progress. Women have achieved an independence there unknown elsewhere in the world.'

'That is true,' said Lady Durwent, who knew nothing whatever about it.

'You are right,' said Madame Carlotti. 'The other day in Paris I heard an American woman whistling. "Have you lost your dog?" I asked. "No," she says; "my husband."'

A chorus of approval greeted this malicious sally, followed by the retailing of various anti-American anecdotes that made up in sting what they lacked in delicacy. These showed no signs of abatement until, slightly nettled, Selwyn put in an oar.

'I had hoped,' he said, 'to find some illuminating points in the conversation to-night. But it seems as if you treat not only your own country in a spirit of caricature, but mine as well. We are a very young race, and we have the faults of youth—but then youth always has a future. It was a sort of post-graduate course to come to England and Europe to absorb some of the lore—or isn't it one of your poets who

speaks of "The Spoils of Time"? Your past is so rich that naturally we look to you and Europe for the fundamental things of civilisation.'

'And what have you found?' asked Elise Durwent.

'Well,' said the American, 'much to admire—and much to deplore.'

'In other words,' said Johnston Smyth, 'he has been to Edinburgh and to London.'

'That is so,' smiled Selwyn; 'but I don't'—

'All people,' said Smyth serenely, 'admire Edinburgh, but abuse London. Over here a man will jest about his religion or even his grandfather, but never about Edinburgh. On the other hand, as every one downs London, and as an Englishman is never so happy as when he has something on hand to grouse about, London's population has grown to some eight millions.'

'I think, Mr Smyth,' said Lady Durwent, 'that you are as much a philosopher as a painter.'

'Lady Durwent,' said the futurist, 'all art is philosophy—even old Pyford's here, though his amounts almost to theology.'

For a few minutes the conversation drifted in inconsequential channels until H. Stackton Dunckley becalmed everything with a laborious dissertation on the lack of literary taste in both England and America. Selwyn took the opportunity of studying the elusive beauty of Elise Durwent, which seemed to provoke the eye to admiration, yet fade into imperfection under a prolonged searching. Pyford grew sleepy, and even Smyth appeared a little melancholy, when, on a signal from Lady Durwent, brandy and liqueurs were served, checking Mr Dunckley's oratory and reviving every one's spirits noticeably.

'Mr Selwyn,' said Mrs Le Roy Jennings, in her best manner, 'after you have subjected England to a microscopic examination for a sufficient length of time, you will discover that we are a nation of parasites.'

'I would rather you said that than I, Mrs Jennings.'

'Parasites,' reiterated the speaker, fixing an eye on some point on the wall directly between Selwyn and the hostess. 'We sprawl over the world—why? To develop resources? No! It is to reap the natural growth of others' endeavours! Yes! The Englishman never creates. He is the world's greatest brigand'—

'Too thoroughly masculine to be really cruel,' chimed in the irrepressible Smyth.

'Brigand,' repeated Mrs Jennings, not deigning the artist so much as a glance, 'skimming the earth of its surface riches, and rendering every place the poorer for his being there.'

There was an awesome silence, which no one seemed courageous enough to break.

'Yes,' said H. Stackton Dunckley finally, 'and in addition England is decadent.'

'But, Mr Selwyn'—again the American heard the voice of Elise Durwent, that quick intensity of speech that always left a moment of startled

silence in its wake—'you have discovered something admirable about England. Won't you tell us what it is?'

'Well,' he said, smiling, 'for one thing, no one can deny the beauty of your women.'

'All decadent nations,' said H. Stackton Dunckley, 'produce beautiful women—it is one of the surest signs that they are going to pieces. The Romans did at the last, and Rome and England are parallel cases. As Mrs Le Roy Jennings says, they are parasitic nations. What did the Romans add to Greek art? The Greeks had this—he made an elliptical movement of his hands—'the Romans did that to it'—he described a circle, then shrugged his shoulders, convinced that he had said something crushing.

'So you think English women beautiful, Mr Selwyn?' said Lady Durwent, trying to retrieve the conversation from the slough of her inamorato's ponderosity.

'Undoubtedly,' answered the American warmly. 'It is no doubt the out-of-door life they lead, and I suppose the moist climate has something to do with their wonderful complexions, but they are womanly as well, and their voices are lovely.'

'I smell a rat,' said Smyth, who was smoking an unlit cigarette, which had fastened itself to his lip and bobbed up and down with his speech, like a miniature baton. 'When a man says a woman's voice is sweet, it means that she has bored him; that what she has to say interests him so little that he turns to contemplation of her voice. This American is a devilish cute fellow.'

A babble of voices took up the charge and demanded immediate explanation.

'To a certain extent,' said Selwyn stoutly, 'there is much in what Mr Smyth says.'

'List to the pigmy praising the oracle,' chanted the artist.

'I do not think,' went on the American, 'that the English girls I have met are as bright or as clever as the cultured young women of the continent of America. In other words, with all her natural charm, the English girl does not edit herself well.'

'In that,' said H. Stackton Dunckley, 'she reflects the breed. The Anglo-Saxon has an instinctive indifference to thought.'

'As soon as an Englishman thinks,' minced Madame Carlotti, 'he leaves England with its *cattivo* climate and goes to the Colonies. *C'est pourquoi* the Empire is so powerful—its brains are in the legs.'

'Come, come,' laughed Selwyn, 'is there no one here but me who can discover any merit in old England?'

'Yes,' said Pyford gloomily; 'London is only seven hours from Paris.'

'Ah—*Parigi!*' ejaculated Madame Carlotti with the fervour born of the feeling in all Latin women that Paris is their spiritual capital.

'And yet,' said Selwyn, after a pause to see if Madame Carlotti's exuberance was going to develop any further, 'in literature, which I suppose is the natural art of the Anglo-Saxon temperament, we still look to you for the outstanding figures. With all our ability for writing short stories—and I think we are second only to the French in that—England still produces the foremost novelists. In the sustained effort required in the formation of a novel, England is yet first. Of course, musically, I think England is very near the bottom.'

'And yet,' said Johnston Smyth, 'we are the only people in the world candid enough to have a monument to our lack of taste.'

Every one looked at the artist, who stroked his left arm with the back of his right hand, like a barber sharpening a razor.

'In that part of London known as Kingsway,' he said, 'there is a beautiful building called "The London Opera House"! He thrust both hands out, palms upwards, as if the building itself rested on them. 'It stands in a commanding position, with statues of the great composers gazing from the roof at the passing proletariat emanating from the Strand. Inside it is luxuriously equipped, as befits the home of Opera.'

'Yes,' said the American, as the speaker paused.

Smyth produced a watch from nowhere in particular. 'It is just past ten,' he said. 'I am not sure whether it is Charlie Chaplin or Mary Pickford showing on the screen at this hour, at the London Opera House.'

A murmur of applause acknowledged the artist's well-planned climax. He looked about with a satisfied smile, then replaced the watch with the air of pocketing both it and the subject.

'But—you have opera?' said Selwyn wonderingly.

'Of course,' said Smyth; 'and where? In a vegetable-market. In Covent Garden. Yet England has been accused of hypocrisy! What other nation is so candid?'

By one of those unspoken understandings that are the rules of mobs and dinner-parties, it was felt that the topic was ceasing to be exhaustive and becoming exhausting. Lady Durwent glanced interrogatively about the table; Madame Carlotti took a hitch in her gown; Norton Pyford emptied his glass and sat pensively staring at it as if it had hardly done what he expected, but on the whole he felt inclined to forgive it; Johnston Smyth made a belated attempt to be sentimental with the Honourable Miss Durwent, whose lips, always at war with each other, merely parted in a smile that utterly failed to bring any sympathy from her eyes; Mrs Le Roy Jennings took a last sip of coffee, and finding it quite cold, put it down with a gesture of finality.

'Lady Durwent,' said Austin Selwyn—and the quality of his voice was lighter and more musical than it had been—'I suppose that a man

who deliberately goes to a country to gather impressions lays himself open to the danger of being influenced by external things only. If I were to base my knowledge of England on what her people say of her, I think I should be justified in assuming that the century-old charge of her decadence is terribly true. Yet I claim to have something of an artist's sensitiveness to undercurrents, and it seems to me that there is a strong instinct of race over here—perhaps I express myself clumsily—but I think there is an England which has far more depth to it than your artists and writers realise. For some reason you all seem to want to deny that; and when, as to-night, it is my privilege to meet some of this country's expressionists, it appears that none has any intention of trying to reveal what is fine in your life as a people—you seek only to satirise, caricature, or damn altogether. If I believe my ears, there is nothing but stupidity and insularity in England. If I listen to my senses, to my subconscious mind, I feel that a great crisis would reveal that she is still the bed-rock of civilisation.'

Madame Carlotti raised her glass.

'To America's next ambassador to England!' she cried.

IV.

The momentous evening was drawing to a close.

Rain, in fitful gusts, had been besieging the windows, driven by an ill-tempered wind that blustered around the streets, darting up dark alleys, startling the sparks emerging from chimney-pots, roaring across the parks, slamming doors, and venting itself, every now and then, in an ill-natured howl.

Inside the refuge of No. 8 Chelmsford Gardens a fire threw its merry warmth over the large music-room, and did its best to offset the tearful misery of the November night.

Conversation had dwindled in energy with the closing hour of the affair, and seizing an auspicious moment, Norton Pyford had reached the piano, and for twenty minutes demonstrated the close relation of the chord of C Minor to the colour brown. Modernist music, acting on *unusual* souls as classical music on ordinary souls, stimulated the flagging conversational powers of the guests, and he was soon surrounded by a gesticulating group of dissenting or condoning critics.

Selwyn noticed that Elise Durwent had not left her seat by the fire, and absenting himself from the harmonic debate, he took a chair by hers.

'You are pensive, Miss Durwent,' he said.

She smiled, with a slight suggestion of weariness, though her eyes had a softness he had not seen in them before.

'I am very dull company to-night,' she said, 'but ever since I was a child, rain beating against the windows has always made me dreamy. I

suppose I am old-fashioned, but it is sweeter music to me than Mr Pyford's new harmonies.'

He laughed, and leaning towards the fire, rubbed his hands meditatively. 'You must have found our talk wearisome at dinner,' he said.

'No,' she answered, 'it was not so bad as usual. You introduced a note of sincerity that had all the effect of a novelty.'

Her mannerism of swift and disjointed speech, which broke all her sentences into rapidly uttered phrases, again annoyed him. Though her voice was refined, it seemed to be acting at the behest of a whip-like brain, and she spoke as if desirous rather of provoking a retort than of establishing any sense of compatibility. Yet she was feminine—gloriously, delicately feminine. The finely moulded arms and the gracefulness of body, indicated rather than revealed beneath her blue gown, intrigued the eye and the senses, just as the swiftly spoken words challenged the brain and infused exasperation in the very midst of admiration. The complicated elements of the girl offered a peculiar fascination to the eternal instinct of study possessed by the young American author.

'Miss Durwent,' he said, 'if I was sincere to-night, it was because you encouraged me to be so.'

'But I said nothing.'

'Nevertheless, you were the inspiration.'

'I never knew a girl could accomplish so much by holding her tongue.'

A crash of 'Bravos' broke from the group around the piano; Pyford had just scored a point.

'You know,' resumed Selwyn thoughtfully, 'a man doesn't go to a dinner-party conscious of what he is going to say. It is the people he meets that produce ideas in him, many of which he had never thought of before.'

She tapped the ground with her foot, and looked smilingly at his serious face. 'It is the reverse with me,' she said. 'I go out to dinner full of ideas, and the people I meet inspire a silence in me of unsuspected depth.'

'May I smoke?' asked Selwyn, calling a halt in the verbal duel.

'Certainly; I'll join you. Don't smoke your own cigarettes—there are some right in front of you.'

He reached for a silver box, offered her a cigarette, and struck a match. As he leaned over her she raised her face to the light, and the blood mounted angrily to his head.

Though a man accustomed to dissect rather than obey his passions, he possessed that universal quality of man which demands the weakness of the feminine nature in the woman who interests him. He will satirise that failing; if he be a writer, it will serve as an endless theme for light cynicism. He will deplore that a woman's brains are so submerged by her emotions; but let him meet one reversely constituted, and he steers his course in another direction with all possible speed.

Selwyn had come to her with a comfortable, after-dinner desire for a *tête-à-tête*. He expected flattering questions about his writings, and would have enjoyed talking about them; instead of which this English girl with the crimson colouring and the maddening eyes had coolly kept him at a distance with her rapier brain. He felt a sudden indignation at her sexlessness, and struck a match for his own cigarette with such energy that it broke in two.

'Miss Durwent,' he said suddenly, lighting another match, 'I want to see you again—soon.' He paused, astonished at his own abruptness, and an awkward smile expanded until it crinkled the very pinnacle of his nose.

'I like you when you look like that,' she said. 'It was just like my brother Dick when he fell off a horse. By the way, do you ride?'

'Yes,' he said, watching the cigarette-smoke curl towards the fireplace, 'though I prefer an amiable beast to a spirited one.'

'Good!' she said, so quickly that it seemed like the thrust of a sword in tierce. 'You have the same taste in horses as in women. Most men have.'

'Miss Durwent'—his face flushed angrily and his jaw stiffened—'I'll ride any horse you choose in England, and'—

'And break the heart of the most vixenish maiden in London! You are a real American, after all. What is it you say over there? "Shake!"'

She slapped her hand into his, and he held it in a strong grip.

'But you *will* let me see you again soon?'

'Certainly.' She withdrew her hand from his with a firmness that had neither censure nor coquetry in it, and the heightened colour of her cheeks subsided with the sparkle of her eyes.

'When?' he said.

'To-morrow morning, if you like. I shall have horses here at eleven, and we can ride in the Row, providing you will put up with anything so quiet as our cattle.'

'That is bully of you. I shall be here at eleven.'

'I thought all Americans used slang,' she said.

'You are the first English girl I have met,' he answered with extraordinary venom in his voice, 'who has not said "ripping."'

Twenty minutes later Austin Selwyn, unable to secure a taxi, tramped along Oxford Street towards his hotel. He had just reached the Circus when the malignant wind, hiding in ambush down Regent Street, rushed at him unawares and sent his hat roistering into the doorway of a store. With a frown, Selwyn stopped and stared at the truant.

'Confound the wretched thing!' he said.

But it is doubtful if he was thinking altogether of the hat.

(Continued on page 84.)

THE HUMOURS OF A TIME-TABLE.

By JOHN MANNOFIELD.

THERE are certain volumes whose most careful study leaves the reader with a very mean idea of his own mental capacity. The convalescent Douglas Jerrold, it will be remembered, was seized with dark apprehensions of impending idiocy because the opening lines of Browning's *Sordello* refused to yield him one rational idea. The awful thought came to Jerrold that during his long illness his mental faculties must have been wrecked. Perspiration sprang to his pores, and smiting his brow, he cried, 'Oh God! I am an idiot!' When mother and wife, whose vigilance he had evaded in thus tasting the illicit enjoyment of reading, arrived on the scene, the alarmed invalid thrust the newly arrived volume into their hands and demanded of them what *they* made of it. Anxiously he watched their expressions as they read, and when before long his wife declared, 'It's gibberish! I don't understand what the man means,' he sank down into his sofa again, greatly relieved. 'Thank God,' said he, 'I'm not an idiot after all!'

Browning's, however, is not the only work whose perusal has left unwary readers in doubt as to their own sanity. Another book of this humbling kind is that careful compilation, marvel of fullness and accuracy and of the printer's art, which has now served eighty years of travellers, *Bradshaw's Railway Guide*. Issued for the first time in October 1839—the year before *Sordello* came to set a standard of incomprehensibility—the maze of figures, the whimsical array of dots, bars, asterisks, daggers, and double-daggers, of this most bewildering though indispensable publication soon outstripped the limits of the ordinary understanding and led the average passenger gravely to suspect his reason. It was as announcing the triumphant discovery of an altogether un hoped-for solution that one of Anthony Trollope's novels declared, '*Bradshaw* was unable to conceal the fact that the earliest train to town next morning left at 8.45.'

It is only fair to add that, after over sixty years of increasing bulk and deepening obscurity, the publishers came about fifteen years ago to the traveller's help. In 1905 a newly arranged *Bradshaw* appeared, the quintessence of puzzlement became amazingly lucid, and the simplified guide of many hundred pages may now be consulted without generating a headache, the outbreak of defamatory adjectives, or the suspecting of one's personal sanity.

The modest beginnings of the famous time-tables took place at a time when this country was in a very different condition as regards 'ways and communications' from that which

now obtains. The evolution of transport from stage-coach to iron-rail was then in progress. The railways already laid were few and crudely built, engines were whimsical in shape and erratic in motion, trains went seldom and slow, the journeying was done in open wagons or in carriages designed on the pattern of the stage-coach which they had come to displace, and carrying the passengers' luggage in like manner upon the roof. It was at this period in the infancy of railway working that George Bradshaw saw his opportunity: the Manchester Quaker and engraver of maps issued what is now a bibliographical curiosity and treasure, the green-and-gold-bound guide to the railways of England. The title-page of the original issue tells the religious views of its originator by the form of dating: '10th mo. 19th, 1839.'

For a time after the inauguration of the first regular train service in this country, people who ventured to risk their lives by the new mode of conveyance were the objects of admiration for their courage or of contempt for their foolhardiness. The speed attained was usually about sixteen miles an hour; but even this rate was too fast for some, and caused them to feel giddy. At first there were no fixed signals; policemen with red and green flags directed the driver, and no trains were run by night. The first junction signal-box was called a lighthouse, and it was proposed that during thick weather the signalman should perform on a large drum! The carriages were lighted by lamps fixed outside, stage-coach fashion. A train in those days presented a much more festive appearance than it does in these sober, utilitarian times. The engine had much burnished brass about it; the coaches were brightly painted in purple, yellow, green, and blue; passengers, travelling on the roofs of the carriages, by their white duck trousers and blue coats added picturesqueness to the scene; while the guard, gorgeous in scarlet coat and silver buttons, sat on a sort of outside perch or rumble and fittingly terminated the gay procession.

But if journeys had not been short ones, the acute discomfort of pioneer railway travelling would have seriously endangered its popularity as a means of passenger transit. To have to sit on the roof meant that outside passengers must use gauze spectacles if they wished to preserve their sight to the end of the run. And the danger from sparks and ashes was tenfold worse when trains were passing through tunnels. Even the luggage, though carefully sheeted over, would catch fire; but the strong conservatism of the companies kept up the practice of loading it on the roof till about as

late as 1860. Altogether, it is not to be wondered at that inside passengers were willing to pay more for the protection of the closed coaches.

While first-class and second-class passengers could secure protection from smoke and sparks and weather, third-class passengers, who down to 1845 had no legal status at all, were put into open trucks, sometimes with seats, but as often without; and for this they were charged three-halfpence a mile. The 'third-class man' was really not desired by many companies at any price. He was conveyed with other unclean animals by cattle-trains; he was shunted about in his bufferless box for hours; and when at last he reached his destination, it was to see a notice that 'the company's servants are strictly ordered not to porter for wagon-passengers.' To the protesting occupants of these trucks, laid up in a siding for hours to let the mail go by, the guard would say, 'Ye mun. bide your time. Yours is only the nigger train.'

So grievous was their state that they excited the sympathetic heart of Mr Punch, who wrote in their defence:

Pity the sorrows of a third-class man,

Whose trembling limbs with snow are whiten'd
o'er,

Who for his fare has paid you all he can;

Cover him in, and let him freeze no more.

It is obvious that the builders of the earliest railways did not intend them for passenger so much as for goods traffic. Or, if they contemplated passengers at all, it was the 'first-class man,' the whole system, like its forerunner, being planned to provide for the well-to-do only, who could travel in their own private carriages placed upon the railway trucks. Of course, we must remember that few persons besides the wealthy, and men whose business it was, travelled at all; the poorer classes did not do so to any great extent. As passenger traffic increased, however, the general public became more and more exacting; keener competition compelled railway managers to add to the luxuriousness of travel for the 'third-class man,' who now forms quite seven-eighths of the whole passenger business of the country.

The Railway Act of 1845 provided that coaches with seats, roofs, sides, and lights be made for all. Some companies interpreted this Act more liberally than others, but few erred on the side of generosity. Most were afraid of diverting the better-paying passengers into the lowest class, with the result that the most miserable vehicles that could be made to meet the bare requirements of the Act were constructed and used for many years.

This obstructive and unenlightened policy toward the travelling public confronted Bradshaw even when attempting to compile his early time-tables. The publication seems to have caused a flutter among the directors, who were

averse to supplying the information he sought, holding that if the times of departure and arrival were given in this manner, they would be bound to run the trains punctually! But the sturdy Quaker accepted no rebuff. He made personal application to the various Boards, and if they refused him the information he desired, he took up shares in the undertakings, and then was able to demand the facts.

What Bradshaw aimed at was a monthly time-sheet for every line in England. Some companies, evidently to bother him, issued the changes in their train-running in the most erratic way; sometimes the sheet was delayed to the 5th or 6th of the month, and was subject to alteration perhaps in the middle, or even toward the close, of the period. By great efforts the railways were induced to consent to adjust their tables, once for all, at the beginning of each month. That concession gained, the rest was comparatively simple, and the *Railway Guide*, pioneer of a great host, began to grow in girth year by year, as the network of railways spread over the face of the land. In 1847 Bradshaw was able to produce a *Continental Guide and Travellers' Manual to the whole Continent of Europe*. The plan began to be imitated both at home and abroad. The familiar yellow-covered volume still holds the palm, however, and in its revised and simplified form is the first favourite of all whose travel takes them over our many lines. From being a source of mystification to the unskilled, the *Railway Guide* has been so reformed that it may now be said that 'the wayfaring men, though fools, shall not err therein.'

The earlier issues contained not only the current prices of railway shares—this was at the time of the great railway mania in the 'forties—but also a remarkable production known as *Thompson's Table*, showing the rate of travel per hour, a reckoner setting forth that a train running a quarter of a mile in fifteen minutes would traverse one whole mile in an hour, and that a train doing a quarter of a mile in four and a half seconds would run two hundred miles an hour! But the trains of those days made sad havoc of such mathematics, and on one line, where pieces of paper torn from a book were used as tickets—the present printing and stamping machines not being universally adopted till 1850—the station-master was wont to say to tardy passengers, 'Now then, hurry up a bit! The train has not long started, and if you look sharp you will catch her up.' A curious sidelight on the difficulties of Bradshaw's efforts to pin down the companies to definite statements is thrown by the Grand Junction Company's regulation that 'the trains will start as soon as ready, without reference to the times stated in the time-tables, the main object being to perform the whole journey as quickly as possible.'

But perhaps the most deliciously paternal notice of all was that issued in connection with Cook's first excursion to Liverpool. The train was timed to leave Leicester at five o'clock in

the morning, and intending excursionists were gravely informed by Bradshaw that 'parties must be *awake* at that early hour, or they will be disappointed.'

THE LUCK OF CAPTAIN FORTUNE.

By JOHNSTON SMITH.

I.

CAPTAIN CALEB FORTUNE of the *Inverness*, commodore of the famous old Ness Line of clippers, was happy in his name. As Captain Brindley of the *Wilderness* frequently expressed it, 'Old Fortune's the luckiest skipper that ever took a ship out of the Clyde, and since ever I knew him the only hint of misfortune he's had has been his daughter.' There was a bitterness in Captain Brindley's tongue, for Miss Fortune had indeed married young Ness, the owner's son and heir, much to Brindley's chagrin. It was a fact, however, that for upwards of fifty years Captain Fortune had sailed the salt seas without losing a ship or one of his ship's crew. But, for all that, he would never so much as admit any question of luck. 'There's nae such thing as luck,' he would say with dogmatic emphasis. 'Luck's juist an excuse to shield the incompetent, and no man gets jot or tittle mair in this world than he works for and achieves by his ain unaided efforts.'

It was a comforting theory to the old martinet, for it exactly epitomised his own steady career, and precluded, besides, any risk of contradiction. But he was yet to learn that there are more things in the voyage of life than are to be found in the pages of the *Nautical Almanac*, and that the expression 'luck,' either good or bad, as the case may be, explains most of them more conveniently than anything else.

II.

The *Inverness* had made a good run out to Rio, where she had discharged part of her general cargo before resailing for Callao. Working round Cape Horn, she had taken a bit of a dusting, but nothing to what Captain Fortune had found waiting for him there on many a trip before. Thereafter, favoured by friendly breezes, the old craft had made good progress northward.

Captain Fortune, however, as a true Scot, was not satisfied. He was, indeed, uneasy. The Celtic races have an extra premonitory sense, and the old man, who had Highland blood in his veins, walked his deck with a strange feeling that something untoward was in the wind, though he could not put a name to it.

Your scientists will construct elaborate and impressive formulæ to prove what happens to the unfathomable sea when the sun and the moon undertake in earnest to work out a new

and original effect; they will talk abstrusely of seismic forces running amok along a fault in the sea-bed. But Captain Fortune had certainly no formula ready for practical use when out of the horizon rose, as unexpectedly as the setting of a stage-scene, a huge wall of curling green water, which moved towards him with terrific and majestic force.

Captain Fortune, with a wild yell of unheard orders, sprang to the wheelhouse, and, with the steersman, swung the *Inverness* bow-on to the impending avalanche. Next moment the old ship shivered convulsively, smothered from stem to stern under a seething green cataract. Her stout masts snapped off short like sticks of celery, and, all tangled up with the wreckage of stays, spars, and halyards, but lightened of her top hamper, the *Inverness* struggled painfully upward again as slowly as an air-bubble in a jar of syrup. An eternity of time seemed to drag its leaden length as, tossed like a cork, pounded, engulfed, buffeted aloft again, and borne ever swiftly and relentlessly onward, Captain Fortune clung to the spokes of the fouled and useless wheel of the old craft.

Then, as suddenly, as capriciously, as the tidal wave had caught her up, it tossed her free again and passed on. Battered, shattered, water-logged, foundering, the poor *Inverness* found herself sliding down, down into an eddying wake that swirled and seethed along her counter.

Numbed and dazed, his indomitable spirit near broken, Captain Fortune clung to his wheelhouse door and wiped his dazed eyes with a sea-soddened sleeve—over the starboard rail rose a phantasmagoria of dripping palm-tree tops!

III.

It took Captain Fortune some minutes to believe the evidence of his senses, for he was a man prone to subject every problem to the practical test of common-sense, and it was beyond ordinary belief to realise that he was still alive or that the *Inverness* was lying high and dry on an even keel in the midst of an indubitable jungle of crushed, broken, and lacerated trees.

He advanced cautiously to the rail and peered overboard at the bed of muddy ooze and undergrowth upon which his ship rested, and then, bellowing loudly for Mr Baker, the mate, he proceeded forrard along his littered deck.

Out of the fo'c'sle hatch, at his skipper's hail, crawled the mate, his ginger head bound up with a blood-soaked handkerchief. At sight of him the captain halted, and, with a wide gesture to indicate the luxuriant growth in the midst of which they had found anchorage, said calmly, 'Mr Baker, the Lord kens where He has brought up the auld *Inverness*, but, anyway, it appears we're no foundered—yet. Call away your watch and have a' this clutter cleared off o' my decks.'

'Ay, ay, sir,' agreed Mr Baker dryly, 'if so be as there's a watch left aboard to call.' His gaze left the trees, now swaying gently above, and picking his way across the deck, he, too, peered overboard. Slowly he turned and regarded the skipper. 'We're aground right enough,' said he, with pointed emphasis.

Captain Fortune cocked his head—a sure sign he was recovering his lost doggedness. 'At present, Mr Baker,' said he, 'we're stuck fast, as you say; but'—

The mate stared at him open-mouthed. 'You're not going to say you ever expect the *Inverness* to float again?'

'And what for no?' demanded Captain Fortune aggressively. 'I've never lost a ship yet'—

'You've spoken that boast once too often, sir.'

Captain Fortune clenched his fist and shook it. 'Mr Baker,' said he, 'mind this: the *Inverness* is neither lost nor foundered yet, and while there's a plank o' her deck or a rib o' her left, I'm her skipper. Is that clear? Verra weel, then; carry on as I tell ye. Call the watch and get to work to red up this mess, for by the looks o' her at present she might be an orra tramp-steamer instead o' a Clyde clipper.'

With a click of the tongue and a look that might have denoted admiration, but didn't seem very like it, Mr Baker turned on his heel.

Of the crowd forrard the sea had taken its toll, and amongst the survivors there was some murmuring when the mate gave his orders. But the red-headed little man was as great a martinet as the skipper, and he saw to it that discipline and authority won.

IV.

On the fourth day after, Mr Baker, with two of the seamen, a compass, and a week's rations, climbed over the side and disappeared into the trackless undergrowth in an attempt to locate their position and to cable a report to the owners.

Captain Fortune, left aboard, continued the task of getting the *Inverness* into sea-trim again. The ship's carpenter was put to work to restep the masts by trimming the stumps and running ingenious derricks across the strongest trees; the sail-maker was set to refashion a kind of jury-rig out of the remnant of the canvas; and, in slings over the side, a

couple of hands were scraping and caulking the strained seams of the hull. It was all typical of Captain Fortune's character that, buffeted by fate, he knew not where, he was still inflexibly set upon leaving nothing to chance.

On the tenth day Mr Baker returned alone from San Jacinto, sixty miles away, where his companions had deserted and shipped home on a Cardiff-bound steamer.

'And,' reported Mr Baker feelingly, 'if it hadn't been for the look of the thing, I would have signed on for the trip myself.'

'Ay,' said Captain Fortune dryly, 'and what was it that brought ye back, then?'

Mr Baker shrugged his shoulders and laughed. 'I dunno,' said he simply, 'but I reckon it must have been curiosity.'

'Nae doot, Mr Baker,' observed the skipper; 'but it should hae been duty.'

However, the mate brought the skipper a reply cable from the owners, which read: 'Await full report from you. Instructions will follow later.'

So the captain wrote his report, detailing in precise, unimaginative language what he knew (and no more) of the phenomenon, and, more precisely still, the present position of the *Inverness*, the damage suffered, and the various steps he had set in motion to repair the disaster. Captain Fortune was no sort of descriptive writer, and he heaved a profound sigh of relief as he addressed and sealed the fateful report.

V.

By the time the owners' reply reached Captain Fortune, his ship's company had dwindled to the mate, the bo'sun, the carpenter, and four hands. Moreover, the owners' letter displeased him vastly, for in plain, business-like phrases they told him (what every one else would have known all along) that the *Inverness* was a total loss, and that they had claimed on the underwriters accordingly. The sting lay in the last words of their instruction.

'A total loss!' said the old man stubbornly. 'But how can she be a total loss if I'm still in command o' her?'

Mr Baker grinned. 'That's an easy one, captain. You're no longer in command, for they've asked you to abandon the ship'—

'For why?'

'Because,' said the mate with deadly lucidity, 'the *Inverness* is a total loss—or what the land-sharks would call a "constructive total loss." It would bankrupt a ship-breaker to look at her where she lies; and you know it, captain.'

'Oh, ay,' admitted Captain Fortune thoughtfully, 'I ken a' aboot that; but what becomes o' the ship an' cargo under thae extraordinar' circumstances?'

Mr Baker shot a shrewd glance at the skipper. He knew the old man's moods, and that his acute mind was never better informed than when he

pretended undue ignorance. So the mate trod delicately. 'The ship and the cargo, or whatever is saved of them, are then generally known as salvage, captain; and another thing,' he added meaningly, as he turned away, 'the man that tries to teach his grandmother to suck eggs is a sillier fool than Joe Baker wants to be reckoned.'

'Hoots, man!' said Captain Fortune genially, 'dinna misjudge yersel'. It's mebbe no sae bad as ye think. But come intil the cabin a minute; I want to talk the thing over wi' ye.'

In the cabin Captain Fortune elaborated the little plan he had already formulated.

'It's this way, Mr Baker,' said he. 'I've been skipper o' the *Inverness* so long that I'm no going to abandon her now, for no man, no matter what the owners say'—

'Then,' interrupted Mr Baker, 'they'll simply dismiss you, not to speak of me and the crew.'

The captain considered the point. 'They canna dae that,' said he; 'but if they retire me, I'll no object, for I'm due the retiring allowance this ten years, and I canna spend it here, anyway. But let that be as it may, Mr Baker, I've decided for to make thae underwriters an offer for the salvage of the hull and the cargo. What d'ye say to that?'

Mr Baker cleared his throat. 'How much is your offer?'

Captain Fortune hesitated. 'I'll go to £2500,' said he at last.

'It's a lot to you, captain, and a bagatelle to them. You'll lose your money.'

'How's that?' asked Captain Fortune innocently.

'Short of a miracle,' said Mr Baker earnestly, 'your money's gone, if they take your offer, and they may see the joke in it—even if it's a Scotch joke and hard to understand.'

'Mebbe ay an' mebbe no,' said Captain Fortune quietly. 'The Scots are often misjudged, and it's true they allow sentiment to sway them in money matters; but, anyway, when I've sunk my capital in the ship she'll be mine to dae wi' as I like, and as a practical proposition I can live in her. It's a kind o' a fatalistic idea, and ye may ca' it sheer perversity and stubbornness, but I mean to bide wi' the auld *Inverness* till her or me slips oor cable again.'

VI.

So Captain Fortune took his own determined way, and in due time bought the ship and her derelict cargo for £2500 from the underwriters—it was money for nothing to them, but privily they smiled and wondered. Every one thought old Fortune mad, and the owners wrote him a sympathetically worded letter of regret that he had decided to retire over the first mishap of his remarkable and valued career. The captain's daughter wrote privately to Mr Baker for his opinion of the skipper's sanity; and Mr Baker attributed his own unaccountable loyalty to an

abhorrence of change and a long-deferred desire to put his theories on fruit-growing to the test of practice in the only chance he had ever had to lead for a spell an uninterrupted shore-going life.

And so, for over a year, Captain Fortune was happy in his stubborn way, carrying on with a faith that might have been ridiculous had it not been pathetic, varying the routine of keeping the ship seaworthy with the cultivation of the land won from the forest about them. Once a month or so Mr Baker tasted the civilisation of San Jacinto, returning with stores, whisky, and tobacco wherewith to assist his philosophic contemplation of life in general and Captain Fortune in particular. But the skipper himself resolutely refused to desert his ship for a day or a night, for, in sooth, his was a faith that could move mountains.

And then, on the thirteenth day of the thirteenth month after their marooning, Captain Fortune's dour faith was justified. Nothing can explain it; no formula—except that of sheer, downright, unmitigated luck—can account for it; but, even so, it happened thus.

A tremor shook San Jacinto, the sea moved, swelling inboard—and San Jacinto was not. Then, rushing onward steadily as the tide over a mud-flat, the flood swept on to the barrier of the coastal range, whence, split in two, it fell back balked, in two wide swathes of rushing torrent. Of these, the southern swathe, tamed to the manner of a broad, swollen river, fell swirling about the old *Inverness*, and restored her, ready and seaworthy, to her lost element.

Two months later Captain Fortune brought her home again, and realised what his name spelled—a fortune for himself, his mate, and his crew.

Any evening in summer the inquirer after the truth of this tale may find Captain Fortune and his late mate playing bowls (even as did Drake) on the close-clipped lawn of the skipper's home at Rothsay. Captain Fortune's luck still holds—nothing else, in Mr Baker's opinion, will account for the disheartening regularity with which the skipper wins each game.

THE ROSE OF YOUTH.

KEEP the rose of youth in your heart
When your own sweet youth is past;
'Twill fling a fragrance around you
As long as your life will last.

Give it the breeze of your laughter,
The dew of your healing tears;
Let the sun of love shine on it
Thro' the burden of the years.

Keep the rose of youth in your heart—
The rose that has ne'er a thorn—
And rest will be yours at night,
And joy will be yours at morn.
M. HEDDERWICK BROWNE.

Chambers's Journal

SEVENTH SERIES

MARION CRAWFORD IN ROME.

By ERIC S. ROBERTSON.

I.

DURING the last five years, librarians tell us, creators such as Robert Buchanan and Christie Murray have fallen out of account; Captain Shaw now pleases beyond Clark Russell; content with M'Kenna, people have dropped Besant. Yet readers still seek, through Marion Crawford's romances, the relief from life's worries that such volumes dispensed for the period of a Victorian generation. Crawford suits the war-weary mood. He cannot make us laugh, but he is good-humoured, at any rate. His sense for the dramatic in topography was of perennial value to him, leading writer and readers up and down Europe in pleasant parties of study, to come away from favoured localities with more sense of geography vitalised than of personalities created. The plot in each tale usually began well enough, but in the middle of his story the author was apt to betray, too easily, a disposition to let that plot go hang. Nevertheless, here was no pretence of digging deep, of putting the crooked straight, of writing in imitation of Meredithian forked lightning. Comfortable reading; sunny scenes; characters chiefly worthy and happy, and elementary in structure; sentences as lucid (though stopping short of style's distinction) as might suit even languid listeners on beds of sickness—such things we gladly received from Marion Crawford, and they still preserve for him a vogue. There never emerged, exactly, a Crawford cult. The novelist's father was distinguished as a sculptor of monuments, but the son—*circumspice*!—has no public monument anywhere on the earth round which he flitted. American by family strain, Marion Crawford has been looked upon coolly by the States as a strayed reveller. Rome for long received him hospitably, but has made no fuss about his memory. England never paid Crawford any personal compliment. The curious may search *Poole's Index of Periodical Literature*, and will be astonished to find how few are the magazine articles that have been written about Crawford. Nobody—in Italy, in America, or anywhere else—has attempted his biography. Sir Walter Raleigh's British book on *The Modern Novel* mentions him not; and just as silent is Pro-

fessor Cross's American treatise on the same theme—both of these works discussing Henry James and other transatlantic contemporaries. Half-educated, by snatches, at Cambridge, Karlsruhe, Heidelberg, Rome, this clever man rose up to write as a comparatively passionless cosmopolitan, his youth's heart-blood pledged to no soil, to no neighbours, to no nation. '*Glissez, mortels, n'appuyez pas,*' he learned to say, with Roy. And so, while retaining a reasonable share of interest in his works, the general world has not noted in Crawford the abiding genius to be loved. 'What shadows we are, and what shadows we pursue!'

II.

The winter of 1878-79 I spent in Rome, and there I met young Crawford familiarly. He was frank, handsome, distinctly lovable. A cheerier soul with whom to glide about the high-shouldered, shuddering streets of the one city where all seems over with the world (you cannot hope here as in Florence) it would be difficult to imagine. Marion's roving life—shared with a roving father—had dowered the youth as polyglot. The home of his adolescence, not far from Santa Maria Maggiore, was the casino of the celebrated Villa Negroni. The casino has disappeared. There, once, Vittoria Accoramboni dwelt in blazing beauty. There Thomas Crawford (pupil of Thorwaldsen) designed the statue of Liberty that now adorns the Capitol in Washington. The house and studio rested in an adumbration of cypresses and orange-trees, over which the evening bells of Santa Maria mingled their tones in aerial harmony. A high tower connected itself with the casino, and on the eve of St Peter's Day Marion and his sister (now Mrs Hugh Fraser) would climb this tower and hang on at the grating of a window, to watch the dream of starland for soaring, roaring rockets that arose from the Pincian Hill in prolonged display, till the children were left alone again with the planets, then crept down the stone steps, chilled and half-frightened.

Such was the centre of vision and memories of unhappy far-off things, and sometimes wistful wonderings about the What Next, that nourished the growing faculty of a novelist. Nothing on earth seemed to hold the affections of Marion

more than Santa Maria Maggiore—its pillared majesty, the gilded frets of its roof mellowed by the echoed choir-song of fourteen hundred centuries, its incomparable carillon, its popularity among the musical folk as the focus of all musical good in religious Rome. It was old Rome that the novelist loved—Rome of the Popes. He had said in *Ave*: 'The taking of Rome in 1870 was the death-blow of medievalism; and the passing away of King Victor Emmanuel and of Pius the Ninth was the end of romantic Italy.' Crawford would grin as he hailed for you a cabman who was a friend, and would whisper that this was one of the many monks ejected from Vallombrosa by Victor Emmanuel on a pension of tenpence a day, to eke out the pittance among horses or in gardens. He would grin no less in describing the 'Victor Emmanuel Library,' a collection of books robbed from the monasteries and carted to the Collegio Romano, where the porter was put in charge of the booty. A poor professional archæologist one morning bought himself half-a-pound of butter in the Piazza Navona, and the greasy wrapping of the parcel was discovered by the scholar to be an autograph letter of Christopher Columbus. The porter was selling parchments by the hundredweight, as wastepaper, and got drunk on the proceeds.

It was in the empty vast of Santa Maria Maggiore that the scholarly Scot, Dr Steele, introduced me to his friend Crawford, nearly as young as myself. Crawford at once reeled off stories of Santa Maria's chief singers. He jeered at the choir organ of St Peter's, so crazy an ancient instrument that during every service a mechanic was in attendance to patch up its bowels. He extolled, however, the singing in St John Lateran of Padre Giovanni, his dear monk-friend with a tenor voice 'soft as a summer's night and clear as a silver bell'—Padre Giovanni, who was later to perish by poison administered by a rival chorister. At the time of my meeting Marion Crawford in Santa Maria, the young man had passed through much instruction of the sort designed to produce opera-singers. His was, indeed, a familiar figure at every sort of reunion gathered together by British or American residents who held any title to being artistic. But Sgambati and Tosti were the companions of his most ambitious and practical hours. It happened that a good deal of musical camaraderie centred round the American Episcopal church. Its modern and costly organ was absolutely the only organ in Rome worthy of the century. Dr Garland, afterwards well known as a virtuoso at Halifax, governed that organ. The large choir had as its leaders a quartette. I was honoured by being asked to sing bass in this quartette. Crawford was our real star, with his tenor voice of striking range and fearless timbre—a sort of apostolic voice (I used to think), but one that occasionally became

lost to control. This mishap was unaccountable and rare; but when it did occur, the effect was just that of a runaway horse in the street. As the horse scorns the traces, so the voice scorned its key or any key. I never have heard any flaw like this in an otherwise admirable song-gift. The two ladies who joined us men in singing quartette anthems were an Irish lady, Miss Flaney, a contralto of the mellowest quality, and Miss Trollope, daughter of T. A. Trollope and niece of Anthony Trollope. The latter lady, whose character and presence were as lovely as her art in singing, was the darling of the English colony in Rome. Some readers of these lines will remember how Miss Trollope, brilliantly fitted to grace the career of any statesman, died within a few months of her marriage to the Honourable Charles Stuart Wortley, M.P. We of the quartette, as guerdon for extra attendances at anthem practices, were accorded private recitals and informal lectures on Bach's works, and Dr Garland's happy efforts in this direction held us devoted to him. One day I came away from a practice a little early, and in a dark passage between two doors bumped up against Dr Nevin, the clergyman, who was entering his church. At the moment we heard Crawford's voice run amok on its highest notes. Instinctively, and with youth's lack of charity, I muttered, 'Alas! there's that fool Crawford letting his voice gallop away with him!' 'Allow me,' replied the clergyman in the dark, 'to introduce you to Mr Crawford's mother.' It was indeed a tenebrous encounter. The lady, it is true, was only Crawford's step-mother. She invited me to tea. All turned out well.

III.

Suddenly the rumour swept through English-speaking Rome that Marion Crawford had abandoned the purpose of entering on an operatic career. Dr Da Cunha, a Portuguese medical man from Bombay, had arrived in Rome, and shadowed the horoscope of Crawford. No one understood how this grave, courteous, silent gentleman fascinated the budding artist. Amazement grew when it was announced that Dr Da Cunha was shortly returning to his medical work in Bombay—Crawford in his company, with a view to learning Sanskrit, of all things or languages. The inscrutable news proved authentic. Dr Steele arranged a dinner-party, at his house in Via Condotti, to bid God-speed to the adventurer on the night before he sailed for the East (I think, from Genoa). The merry meeting was a *partie carrée*—Da Cunha, Crawford, Steele, myself. Crawford was on the tiptoe of expectation. Da Cunha said little, but his Portuguese eyes of brown and teeth of pearl-white conspired in smiles as the ex-tenor expatiated on things occult and told our fortunes by palmistry. The doctor from St Andrews,

Steele, had taught one of his tradesmen to produce minced collops (rechristened *carne buttata*), and our feast included this Scottish dish, which the Bombay brother relished and praised. The result of the eastern voyage was as strange as the inception of that journey. Hardly had India been reached, when Sanskrit was thrown to the winds, Dr Da Cunha and his disciple parting company. Having got through his allowances from home friends, Marion took to journalism as suddenly as he had engaged to become an Oriental linguist. On the *Allahabad Indian Herald* he gained, with some hardship, a knowledge of the working side of a newspaper life. Then he tired. Cosmopolitans seldom feel the true heart-beat of any country. India was then palpitatingly awaiting the advent of wizard Kipling, to reveal many of her treasures. Alien to the governing race, ignorant of the customs and languages of the governed people, Crawford left India, almost as little in touch with it as when he first trod its shores. His one novel of India apotheosises an ordinary Simla jeweller of Persian extraction, and gives to him princely power in occult realms, and the rapturous love of a well-born Englishwoman. I lived for five years in India, after Crawford left it, and I found that both Anglo-Indians and native readers of books written in English regarded *Mr Isaacs* as a fantasy throwing no real light on any sort of society in the great dependency. The many admirers of Sir George Henschel's *Memories* have been told in that recent work how Crawford abandoned India in disgust, and turned up, penniless, among his friends in New York. Nobody knew what now to do with this god-like, attractive, spendthrift wanderer. Sir George was engaged by Crawford's aunt, Miss Julia Ward Howe, to test the prodigal's fitness for opera. Sir George carried out the necessary tests, which revealed an insurmountable defect. In one of his own novels Marion Crawford explains this defect as a discrepancy by which a man's left ear may sometimes hear things a shade higher or lower in pitch than the right ear does. Sir George Henschel says his verdict reduced Crawford to tears. Then up spoke the aspirant's uncle. 'Why don't you write down the little story you told me of that strange experience you had in India?' This was in January 1882. The sensation of the following Christmas, as things turned out, was *Mr Isaacs*.

A year or two later I agreed to edit the projected 'Great Writers' series. In arranging a list of my first twelve biographers, I bethought me to ask Marion Crawford to undertake *Hawthorne*. Crawford's reply revealed how quickly (after vicissitudes) this man of many talents had fallen into his proper work and fortune, like a wheel dropped into its exact function among the pieces of a watch. The business portion of the communication showed this author ready to join the 'Great Writers'

staff, provided his literary work was as well paid as his novel-writing was. Retaining his book-copyright, the manufacturer of pleasant tales was drawing from a combination of the *Atlantic Monthly* and *Blackwood's* the sum of £140 for each month's serial instalment of a novel.

IV.

As regards Rome, Crawford once uttered a severe literary judgment (*Sant' Ilario*): 'I do not hesitate to say that, without a single exception, every foreigner, poet or prose-writer, who has treated of these people has more or less grossly misunderstood them. . . . To understand Italians, a man must have been born and bred among them.' He who turns to Crawford's *Ave Roma* for an account of the Eternal City finds that most elaborate of the author's efforts a book to be classed neither as historical nor as political, neither as archaeological nor as artistic. It does not give as full a sense of the Roman days Crawford lived through as Story's *Roba di Roma* affords. Mr Story it is who best enables us to enjoy the ballad-singers, and *pifferari* in Novena, the cafés and the theatres, the sombre pomps of Lent, the festivals of artists, the songs of the Campagna, torchlight in the Catacombs, the palaces of the historic princes, the Ghetto, the surviving traces of the Saturnalia, the illuminations of St Peter's, the plays of Goldoni. The main design of *Ave* is sentimental. The author is an embodied *Carmen Sæculare*, a masquer, with a rose in his bosom. He is not bewildered by Rome. He writes: 'It is better to feel much in Rome than to try and know a little.' In *Ave* this dreamer takes much the same attitude of affectionate conservatism as we find in the Roman trilogy of *Saracinesca*, *Sant' Ilario*, and *Don Orsino*—that trilogy representing Rome from 1865 to 1870. 'Old Rome is dead, too, never to be old Rome again. The last breath has been breathed, the aged eyes are closed for ever, corruption has done its work, and the grand skeleton lies bleaching upon seven hills, half-covered with piecemeal stucco of a modern architectural body. The result is satisfactory to those who have brought it about, if not to the rest of the world. The sepulchre of old Rome is the new capital of united Italy.' 'The world might have been what it is without Alexander, without Charlemagne, without Napoleon, but not without Julius Caesar. . . . Alexander left chaos behind him, while Caesar left Europe.' Horace was idolised by Crawford, who ignored Juvenal, and declared about Virgil: 'Appealing to the tradition of a living race of nobles, he does not appeal to the modern man.' Born at Bagni di Lucca, in the pontificate of Pio Nono, our novelist ever regarded the Pope as rightfully a temporal sovereign. He cared little for the House of Savoy, and dismisses Garibaldi with the remark that 'he possessed little or no military science.' In the Rome of

his own time, Crawford is equally disdainful of American women (*With the Immortals*): "There were no American women in my day," said Francis, "but I have seen something of them since, without being able to understand them. They are not very like women." Characteristically, this author finds that, although Roman nobles are Roman by tradition, by blood (through admixture in marriage) they are almost cosmopolitan. Perhaps only Crawford, among foreign writers, has been allowed to stroll habitually into the domestic privacies of these noble families; and here he achieves solid descriptive documentation. For instance (*Sant' Ilario*): 'At a rough estimate the Montevarchi household comprised over a hundred persons, all living under the absolute and despotic authority of the head of the house. From his will and pleasure depended every act of every member.' The establishment was outwardly splendid, inwardly squalid. 'The princess never had a *scudo* in her pocket, had to obtain permission and money to purchase the smallest necessities, and if she wanted a cup of coffee or some bread and butter out of hours, it was charged to her daily account. Her husband's youngest brother, who had no money of his own, could not get even a lemonade in his father's house without his father's consent.'

V.

We may take it as likely that Crawford refers more or less to his own early career when he writes thus of the literary hero in *The Three Fates*: 'The young man's true talent lay in his ready power of assimilating unfamiliar knowledge by a process of intuition which escapes methodical learners,' and his 'solid acquirement was the power of using his own language.' Goethe has bidden us, in testing character, notice what a man pronounces ridiculous.

Crawford finds little that seems ridiculous. He has wealth of sympathy. He himself writes: 'The only way to judge of a man is to find out what has been the happiest hour in his life, and then judge of the circumstances which made up his momentary happiness.' Lastly, this passage may be quoted from the romancer's writings to help us in estimating Crawford's outlook on his art: 'The position of the professional artist and of the professional man of letters in modern European society is ill-defined. As a man who has been brought up in a palace would undoubtedly betray his breeding sooner or later if transported to live among a gang of thieves, so a man who has grown to years of discretion in the atmosphere of studios or in the queer company from which most literary men have sprung will inevitably, at one time or other, offend the susceptibilities of that portion of humanity which calls itself society. It is impossible that it should be otherwise. Among a set of people whose profession it is to do always, and in all things, precisely what their neighbours do, the man who makes his living by doing what other people cannot do must always be a marked figure.'

There was undoubtedly a touch of the 'harum-scarum' in Crawford's career—as in that of many an artist to whom the world has become indebted. But the eccentricities of such a man are soon forgotten. His pleasant stories and his engaging character merit the attention of some student who can write. If nothing more bulky should appear, it were at least to be hoped that in the 'American Men of Letters' series we might be given some account of a novelist whose active mind made of its existence one prolonged *wanderjahr*, and left an oasis of romance wherever it tarried and tested the soil, like the faculty of a water-diviner.

THE PARTS MEN PLAY.

CHAPTER VI.—A MORNING IN NOVEMBER.

I.

AUSTIN SELWYN rose from his bed and looked at Berners Street glistening in a sunlight that must have warmed the heart of Madame Carlotti herself. With a lazy pleasure in the process, he recalled the picture of Elise Durwent sitting in the dim shadows of the firelit room; he felt again the fragrance of her person as he leaned over her with the lighted match. On the canvas of his brain was thrown the rich colouring of the English girl, with the copper-hued luxury of hair and the eyes that seemed to steal some magic from the fire; and he saw again those warring lips, the crimson upper one chiding the passionate scarlet of its twin.

Idly, while enjoying the unusual dissipation

of a pre-breakfast cigarette, he tried to imagine the course of incident and heredity that had produced her strange personality. That there was a bitterness somewhere in her disposition was obvious; but it certainly could not have come from the mother, who was the soul of contentment. He found himself speculating on the peculiar quality of personality, that strange thing which makes an individual something apart from others of his kind, that gift which singles out a girl of ordinary appearance and leaves one of flawless beauty still wagging her pretty head in the front row of the chorus. From that point he began to speculate on the loneliness of personality, which so often robs its owner of the cheery companionship of commonplace people.

On the whole, he regretted that he was going to see her again so soon. Her pertness, which had seemed fairly clever the previous night, would probably descend to triteness in the morning; he could even see her endeavouring to keep up the same exchange of short sentences. Bah! It was like a duel with toothpicks. The stolid respectability of Berners Street lent its aid to the conviction that the morning would hold nothing but anti-climax.

And he was poet enough to prefer an unfinished sonnet to one with an inartistic ending.

II.

Austin Selwyn was twenty-six—an age which has something in common with almost every one of the seven celebrated by Shakespeare. Like most men in their twenties, he had the character of a chameleon, and adapted himself to his surroundings with almost uncanny facility. At college he had been an ardent member of a dozen cliques, even falling under the egotism of the men who dabbled in Spiritualism, but a clarity of thought and a strain of Dutch ancestry kept his feet on the earth when the rest of him showed signs of soaring.

Some moderate wit had said of him at college that he was himself only twice a day—when he got up in the morning and when he went to bed at night. This Stevensonian theory was not quite true, for a chameleon does not cease to be a chameleon because it changes its colour.

It was perhaps his susceptibility to the many vintages of existence that had impelled him to write, authors being more or less a natural result of the economic law of intake and output. As is the habit of most young writers, he wrote on various subjects, put enough material for a two-volume novel into a short story, and generally revelled in the prodigality of literary youth. He was prepared to be a social satirist, a chronicler of the Smart Set, a champion of the down-trodden masses, or a commercial essayist, according to the first public that showed appreciation of his work.

Although he had lived in Boston, that city which claims so close an affinity to ancient Athens (as a matter of fact, has it not been said that Athens is the Boston of Europe?), he was drawn to the great vortex of New York, that mighty capital of modernism which sucks the best brains of an entire continent. For some time he wrote beneath his own standard and with considerable success. Following the example of several successful New York authors, he plunged into a hectic portrayal of 'high' society, a set of people that makes one wonder as to the exact meaning of the adjective. For a short space he came under the influence of the studied Bohemianism of 'Greenwich Village,' and wrote deucedly clever things for the applause of the villagers, then sneered at American taste

because people in Arkansas did not like his work. Still retaining his love of Greenwichery, he next succumbed to the money lure of the motion-picture industry, which offered to buy the picture-rights of his stories, provided he would introduce into them the elements which go to make up successful American films.

With the prospect of a bank president's income before him, he succeeded in writing his share of that form of American literature which has a certain love interest, almost obscured by a nasty sexual diagnosis, an element of comedy relief, and, above all, a passionate adherence to the craze of the moment—a work that fades from the mind with the closing of the book, as the memory of the author's name vanishes almost before the last sound of the earth dropped upon his coffin.

He knew that there were sincere *literati* writing of the abiding things that do not die with the passing of a season, but the clamour of commercialism drowned their voices. As though they were stocks upon an exchange, he heard the cries: 'Brown's getting five thousand dollars a month writing serials for Hitch's;' 'Smith sold two novels on synopsis for thirty thousand dollars;' 'Green's signed up with Tagwicks for four years at two thousand dollars a month writing problem novels.' Into the maelstrom of 'Dollars, Dollars, Dollars' the sensitive brains of all America were drifting, throwing overboard ideals and aspirations in order to keep afloat in the swirling foam.

And then—the Fates stooped and touched his destiny with a star.

A New York publisher (one of that little group which has for its motto, 'Art for Art's sake,' not 'Art, for God's sake!') noticed him, and spoke of literature as an expression of the soul, a thing not of a season or a decade, but as ageless as a painting.

His ear caught the new song of attainment just as readily as it had received the chorus of 'Dollars.' He wrote a novel of New England life, full of faults, but vibrant with promise; and having gathered together quite a nice sum of money, he went to England, at the advice of the before-mentioned publisher, there and elsewhere in Europe to absorb the less oxygenic atmosphere of older civilisations, which still gives birth to the beginnings of things.

Twice he had visited Paris. The first time, with the instinct of the tourist, he had discovered the vileness of the place—a discovery fairly easy of accomplishment. The second time he had ignored the tourist-stimulated aspect of Paris life, and had allowed his senses to absorb the soul of the Capital of all the Latins, the laboratory of civilisation. And he who has done that is never the same man again. Germany had ministered to his reason, and Italy to his emotions; but he found his greatest interest in London, which offered to him an endless inspira-

tion of changing moods, of vagrant smells, and the effect of a stupendous drama of humanity.

Under the spell of Europe's ageless artistry and the rich-hued meadows of England's literary past he had grown humble. The song of 'Dollars' was less clamorous than the echo of the ocean in the heart of a sea-shell. When he wrote, which was seldom, he approached his paper-littered desk as an artist does his canvas. It was the medium by which he might gain a modest niche in the Hall of the Immortals—or, failing that, his soul at least would be enriched by the sincerity of his endeavour.

In that highly artistic frame of mind he suddenly secured the *entrée* into London Society. For some reason, as unaccountable as the reverse, a wave of popularity for Americans was breaking against the oak doors, and he was carried in on the crest. The result was not ennobling. The dormant instinct of satire leaped to life and the idealist became the jester.

But then he was twenty-six and most agreeably susceptible to haphazard influence. Being a Bostonian, he acquitted himself with creditable *savoir faire*; and being an American, his appreciation of the ridiculous saved him from the quagmire of snobbery, though he made many friends and dined regularly with august people, whose family trees were so rich in growth that they lived in perpetual gloom from the foliage.

Lady Durwent's dinner-party had been an expedition into the artistic fakery of London, and he would have dismissed the whole affair as a stimulating and amusing diversion from the ultra-aristocratic rut if the personality of Elise Durwent had not remained with him like a haunting melody.

He looked at his watch. 'By Jove!' he muttered; 'it's nine o'clock;' and hurriedly completing his ablutions, he dressed and descended to breakfast.

III.

Into the row of splendidly inert houses known as Chelmsford Gardens, Austin Selwyn turned his course. A couple of saddle-horses were standing outside No. 8, held by a groom of expressionless countenance. From No. 3 a butler emerged, looked at the morning, and retired. Elsewhere inaction reigned.

Ring the bell, Selwyn was admitted into the music-room of the previous night's scene. The portrait of a famous Elizabethan beauty looked at him with plump and saucy arrogance. In place of the crackling fire a new one was laid, all orderly and proper, like a set of new resolutions. The genial disorder of the chairs, moved at the whim of the Olympians, had all been put straight, and the whole room possessed an air of studied correctness, as though it were anxious to forget the previous evening's laxity with the least possible delay.

'Good-morning.'

Elise Durwent swept into the room with an impression of boundless vitality. She was dressed in a black riding-habit with a divided skirt, from beneath which a pair of glistening riding-boots shone with a Cossack touch. Her copper hair, which was arranged to lie rather low at the back, was guarded by a sailor-hat that enhanced to the full the finely formed features and arched eyebrows. There was an extraordinary sense of youthfulness about her—not the youthfulness of immaturity, but the stimulating quality of the spirit.

'I came here this morning,' began Selwyn vaguely, 'expecting'—

'Expecting a frumpy, red-haired girl with a black derby hat down to her nose.'

He bowed solemnly. 'Instead of which, I find—a Russian princess.'

'You are a dear. You can't imagine how much thought I expended on this hat.'

'It was worth it. You look absolutely'—

'Just a minute, Mr Selwyn. You are not going to tell me I look charming?'

'That was my intention.'

She sighed, with a pretty pretence at disappointment. 'That will cost me half-a-crown,' she said.

'I beg your'—

'Yes; I wagered my maid two-and-six to a "bob" that you wouldn't use that word.'

'It is really your fault that I did,' he said seriously.

She curtsied daintily. 'I make money on Englishmen and lose it on Americans,' she said. 'My maid and I have a regular scale of bets. I give ten to one that an Englishman will say in the first ten minutes that I look "topping;" five to one on "absolutely ripping;" and even money on "stunning" in the first hour.'

His face, which had been portraying an amusing mixture of perplexity and admiration, broke into a smile which encompassed all his features. 'Do all bets cease at the end of the first hour?' he asked.

'Yes, *ra-ther*. An Englishman never pays compliments then, because he is used to you. Isn't it awful seeing people getting used to you?'

'Do they ever?'

'Umph'm. The only chance of bagging one of the nobility as a husband is to limit interviews to half-an-hour and never wear the same clothes twice. Startle him! Keep him startled! Save your most daring gown for the night you're going to make him propose, then wear white until the wedding. An Englishman will fall in love with a woman in scarlet, but he likes to think he's marrying one who wears white. Costume, my dear Americano—costume does it. Hence the close alliance between the nobility and the chorus. But come along; we're snubbing the sunlight.'

With something like intoxication in his

blood, he followed his imperious, high-spirited companion from the house. He hurried forward to help her to mount, but she had her foot in the stirrup and had swung herself into the saddle before he could reach her side. With less ease, but with creditable horse-management, Selwyn mounted the chestnut and drew alongside the bay, who was cavorting airily, as if to taunt the larger horse with the superior charm of the creature that bestrode him.

'We'll be back, Smith, at twelve-thirty,' she called; and with the tossing of the horses' heads, resentful of the restraining reins, and the clattering of hoofs that struck sparks from the roadway, they made for the Park.

IV.

London is a stage that is always set. The youthful Dickens watching the murky Thames found the setting for his moments of horror, just as surely as cheery coach-houses, many of them but little changed to this day, bespoke the entrance of Wellers senior and junior. London gave to Wilde's exotic genius the scenes wherein his brilliantly futile characters played their wordy dramas; then, turning on the author, London's own vileness called to him. Thackeray the satirist needed no further inspiration than the nicely drawn distinction between Belgravia and Mayfair. Generous London refused nothing to the seeking mind. Nor is it more sparing to-day than it was in the past; it yields its inspiration to the gloom of Galsworthy, the pedagogic utterances of Mr Wells, the brilliant restlessness of Arnold Bennett, and the ever-delightful humour of *Punch*.

On this morning in November London was in a gracious mood, and Hyde Park, coloured with autumn's pensive melancholy, sparkled in the sunlight. Snowy bits of cloud raced across the sky, like sails against the blue of the ocean. November leaves, lying thick upon the grass, stirred into life, and for an hour imagined the fickle wind to be a harbinger of spring. Children, with laughter that knew no other cause than the exhilaration of the morning, played and romped, weaving dreams into their lives and their lives into dreams. Invalids in chairs leaned back upon their pillows and smiled. Something in the laughter of the children or the spirit of the wind had recalled their own careless moments of full-lived youth.

Paris, despite your Bois de Boulogne; New York, for all the beauties of your Central Park and Riverside Drive—what have you to compare with London's parks on a sun-intoxicated morning in November?

Reaching the tan-bark surface of Rotten Row, Selwyn and the English girl eased the reins and let the horses into a canter. With the motion of the strong-limbed chestnut the American felt a wave of exultation, and chuckled from no better cause than sheer enjoyment in the morning's

mood of emancipation. He glanced at Elise Durwent, and saw that her eyes were sparkling like diamonds, and that the self-conscious bay was shaking his head and cantering so lightly that he seemed to be borne on the wings of the wind. Selwyn wished that he were a sculptor that he might make her image in bronze: he would call it 'Recalcitrant Autumn.' He even felt that he could burst into poetry. He wished—

But then he was in the glorious twenties; and, after all, what has the gorged millionaire, rolling along in his beflowered, bewarmed, be-cushioned limousine, that can give one-tenth the pleasure of the grip on the withers of a spirited horse?

Sometimes they walked their beasts, and chatted on such subjects as young people choose when spirits are high and care is on a vacation. They were experiencing that keenest of pleasures—joy in the *present*. For centuries philosophers have sought to prove the musty theory that happiness is only in retrospect or anticipation. It is not true, although there is happiness in both of these; but complete enjoyment of the passing hour, with never a thought of the yesterday or the to-morrow, is one of the climaxes of life.

They watched London Society equestrianising for the admiration of the less washed, who were gazing from chairs and benches, trying to tell from their appearance which was a duke and which merely 'mister'—and usually guessing quite wrongly. Ladies of title, some of them riding so badly that their steeds were goaded into foam by the incessant pull of the curb bit, trotted past young ladies and gentlemen with note-books, who had been sent by an eager Press to record the activities of the truly great. Handsome women rode in the Row with their children mounted on wiry ponies (always a charming sight); and middle-aged, angular females, wearing the customary riding-hat which reduces beauty to plainness and plainness to caricature, rode melancholy quadrupeds, determined to do that which is done by those who are of consequence in the world.

But pleasures born of the passing hour, unlike those of the past or of anticipation, end with the striking of the clock. It seemed to Austin Selwyn that they had been riding only for the space of minutes, when Elise asked him the time.

'It is twenty minutes to one,' he said. 'I had no idea time had passed so quickly.'

'Nor I,' she answered. 'Just one more canter, and then we'll go.'

The eager horses chafed at their bits, and pleaded, after the manner of their kind, to be allowed one mad gallop with heaving flanks and snorting triumph at the end; but decorum forbade, and contenting themselves with the agreeable counterfeit, Selwyn and the girl reluctantly turned from the Park towards home.

The expressionless Smith was waiting for them, and looked at the two horses with that peculiar intolerance towards their riders which the very best groom in the world cannot refrain from showing.

'Won't you come in and take the chance of what there is for lunch?' she said as Selwyn helped her to dismount.

'N-no, thanks,' he said.

She pouted, or pretended to. 'Now, why?' she said as Smith mounted the chestnut, and touching his hat, walked the horses away.

'There is no reason,' he said, smiling, 'except—look here; will you come down-town and have dinner with me to-night?'

'You Americans are refreshing,' she said, burrowing the toe of her riding-boot with the point of the crop. 'As a matter of fact, I have to go to dinner to-night at Lady Chisworth's.'

'Then have a headache,' he persisted. 'Please,' as her lips proceeded to form a negative.

'Some one would see us, and Lady Chisworth would declare war.'

'Then let us dine in some obscure restaurant in Soho.'

'There's no such thing, old dear. Soho is always full of the best people dining incog. Almost the only place where you are free from your friends is Claridge's.'

'Well'—his nose crinkled at her remark—'then let us go to Claridge's. Miss Durwent, I know I'm too persistent, but it would be a wonderful ending to a bully day. You know

you'll be bored at Lady Chisworth's, and I shall be if you don't come.'

'Humph!' She stood on the first of the stone steps, her agile gracefulness lending itself to the picture of healthy, roseate youth. 'Where could we meet?'

'Let me call for you.'

'N-no. That wouldn't do.'

'Would your mother object?'

'Heavens, no!—but the servants would. You see, English morality is largely living up to your servants—and we only met last night.'

'But you will come?' He crossed his hands behind his back and swung the crop against his boots.

'Mr Selwyn,' she said, 'your books should be very interesting.'

'From now on they will be,' he said, 'if'—

'All right,' she interrupted him with something of the staccato mannerism of the evening before. 'I'll motor down in my little car, and we'll go to the Café Rouge.'

'Good—wherever that may be.'

'No one has discovered it yet but me,' she said. 'Then I shall have a headache at four, and meet you outside Oxford Circus Tube at seven.'

'You're a real sport, Miss Durwent.'

'Ah, monsieur'—she smiled with a roguishness that completely unsettled him for the remainder of the day—'have you no sympathy for my headache?'

THE STORY OF A MANTIS.

By H. W. EVANS.

THERE are three kinds of mantis quite common in Palestine—one a slender little gray creature, which blows into one's tent like a bit of dried twig; a second, larger, and fatter, and speckled like the leaf of a milk-thistle; and the third, a still larger kind, about three inches long, of a pure light-green colour.

All three have the same curious habit of sitting up with their forelegs bent just in front of the mouth, in the attitude of a man at his devotions, which has earned for the insect the name of 'praying mantis.' A slight swaying movement from side to side, however, gives it, to my mind, an entirely different aspect—that of a boxer sparring; and the extraordinary swiftness of the knock-out blow which lays low a passing fly, and the rapidity with which the victim is eaten, are far from devotional and pacific.

My mantis was of the last kind. Strolling one evening in spring through an orange-grove, enjoying the scent of the blossoms and looking for butterflies, I spied her on the trunk of a tree, her six feet resting on the bark holding her upside-down—her favourite position, as I found

out during her five months' captivity. I caught her nimbly round the waist, receiving a bite and a scratch which drew blood, and carried her home in my handkerchief. She was a fine specimen, and highly resented imprisonment.

One feature always fascinated me. Balanced on a slender neck she had a perfect head, which she could move freely from side to side and up and down whilst looking for flies—an uncommon attribute in insects, whose head and thorax are so often completely or partially fused. With her powerful little jaws, large transparent eyes, and long waving antennæ, there was something diabolically human in the way she turned her flat pointed head round, watching for her prey.

A large cage was easily constructed by knocking the top and bottom out of a bully-beef case, and covering them in with mosquito netting. I stuck a branch of olive wood in the centre, and placed her inside. She stalked grandly towards the branch with a peculiar mincing gait, swinging her body backwards and forwards, and treading delicately like an ostrich, until she finally settled on a twig in her favourite position, and

took stock of her surroundings. I put in two flies, which buzzed about merrily, and then landed on the netting nearest the light, and walked about as they would upon a window-pane. After a few minutes' interested watching the mantis climbed up her perch, across the roof, and down the netting, whilst the flies buzzed again round the box. In a short time they settled once more on her side, and after a wash and brush up set off to explore. She watched them quietly. One walked right under her body, but, being out of striking distance, continued its journey unmolested. The other, travelling at a lower level, passed about an inch below her head. Like a flash the two great weapons lashed out, and there lay the fly, held as in a vice in one of her claws. Imagine an arm ending in a hand with one long index-finger, the elbow bent, and the hand flexed at the wrist so that the back of the wrist is just in front of the mouth. The inner surface of this last joint is serrated with a row of short, very sharp spines. When the mantis strikes it secures its prey in this joint, holding it like a nut in a pair of nut-crackers, and no amount of struggling can free it.

In about a minute the fly was eaten *in toto*, and shortly after the second shared its fate. The average time for fly consumption was forty-five seconds, and her capacity for this food I never discovered. After forty-eight one afternoon it was I that gave it up, not the mantis. It is warm work stalking flies round the Mess in Palestine in summer.

I tried her with other food. A grasshopper fell an easy prey, as it walked straight into the danger-zone, and in spite of its struggles was quickly despatched. In the matter of large game she was somewhat of an epicure. She would bite through the carapace at the junction of the head and the neck, and eat only the brain. Then the carcass was dropped.

I continued investigations concerning her diet. One afternoon about five o'clock, when a gentle breeze was blowing and the glorious soft evening had set in, so like a fine evening at home in June, but even more lovely in contrast to the burning heat of the day—the time when the old men bring out their beds to lie in the open, and the sick enjoy a few hours of cool and rest, just as they did in the time of Christ—I set off with a butterfly-net to forage in the fields behind the camp. Two common yellow butterflies were easily caught, and another grasshopper. Suddenly a whirl and a plop amongst the leaves of an olive-tree drew my attention to a fine big locust. A chase over two fields and he was added to the bag. Then a flash of blue and gold, and a *tryxalis* landed at my feet—another kind of locust with a long pointed head and sabre-like antennæ. He had a pair of beautiful gauzy wings, of a gentle shimmering blue, fading to a golden border. He resented being confined with the commoner sombre-coloured locust, but settled down quietly

in one corner of my box with the two butterflies. A little farther on was the spoor of a tortoise, two parallel lines of claw-marks, with a flat, smooth trail between. This ended in a clump of grass, and poking in the sand with the handle of the net soon brought him to light. I carried him home, and was interested to find that he shared with Peter, a tortoise I have known for many years in England, a predilection for yellow food, eating the petals of any yellow flower and the yellower parts of a cabbage or a lettuce before anything else.

In the next field were two dung-beetles rolling their ball of dung along, a fascinating progress to watch, one pushing and the other pulling, and, in spite of all obstacles put in their way, trekking straight for their lair. I left them hard at work, but captured a big lazy fellow who was dozing away beside them. Behind was a prickly hedge, on which a shrike had just impaled two beetles. I searched carefully, but did not find the nest. The shrike was on very friendly terms with a hoopoe who lived in a mulberry-tree close by, and I often saw them flash past in the evening. I impaled another beetle for him, but though the first two had disappeared next day, my contribution to the mess remained untouched.

A sudden flutter at my feet, and a lark soared away into the sky. I looked around carefully for the nest, and found a large, dark hole, surrounded by a fringe of nettles and grass. It was one of those caches (about five feet deep—a bricked-in cavity, of beehive shape and open at the top) in which the natives still store their grain. In the dim depths I saw something very like a grass-snake. I jumped down, and found a scribbling lark's egg, cold and addled, watched over by a solemn old toad. There was no nest, so I suppose the egg must have been carried in by some marauder. The snake had disappeared into a crack in the wall, but two devil's coach-horses were running a furious chariot-race round the hole.

The toad looked too ugly and venomous to carry away, so I just put him amongst the cool grass at the top of the hole to get a little fresh air. A few days later he had hopped back again, and was sitting as solemn and placid and ghoulish as ever.

Finally I found what I was looking for. I had seen several hornets flitting amongst the cactus-leaves a few days before, and had blazed their favourite resting-place, a curled-over leaf, under which two or three were always crouching. There was no sign of a nest either here or in the neighbourhood, but this time there were a good dozen of them to be seen. An exciting time followed for a few minutes, and I came away hurriedly with two in the corner of my net.

My walk home was uneventful. The frogs had started their chorus by the wells, a peculiar insistent metallic noise, like a thousand riveters

at work ; two little owls, which always came out at sunset and stayed up till nine in the morning, flitted past me amongst the sycamores ; and a noisy flock of bulbuls chattered to roost in the mulberry-trees. Just before I got back to camp, however, on the trunk of a lemon-tree I found another female mantis of the same kind, though not so big, as my first. I put the various insects safely away for the night, and the second mantis in the cage with the other. They made no friendly overtures, but retired to opposite ends of the box. They each had a couple of drowsy flies for supper, and I left them for the night.

Next morning my mantis was in her usual place looking for her breakfast, and on the bottom of the box, lying on her back, and partially devoured, lay the second. When the tragedy took place I do not know. It was probably at dawn, when they both started foraging for food, that they met, and the weaker went to the wall. Twice after the gruesome story was repeated. Perhaps my mantis was too fit for the intruders ; certainly the only battle I witnessed was a very short affair. Had it stopped short of cannibalism it would not have been so gruesome.

The butterflies were not part of her diet, and after a few hours' confinement were released. Both locusts were killed, and their brains picked out ; and the caterpillar shared their fate. The dung-beetle proved too hard a nut to crack, and was left to blunder round the box till I released him next day.

I was interested to see how the hornets would fare. Knowing that they are well enough armed to take care of themselves, and, by their markings, are unpalatable as food, I trained the mantis with a day's gorge and a day's starvation before the encounter. There was at once excitement in the air. The mantis drew herself up and prepared for battle. Her antennæ waved more vigorously than ever, and her little head moved swiftly to and fro as she watched them crawl towards her. She brought her feet nearer together, and so raised her body high up away from the net, on which she was standing.

The first hornet walked under her and nibbled a leg as he passed. She drew up her foot, but made no other sign. He curled his sting up towards her abdomen, but it was out of reach. The other, commencing a frontal attack, charged head on towards her front-paws. Like a flash they shot out, but, instead of seizing him, she caught him a stinging blow between the eyes and knocked him about eight inches away on to the bottom of the box. He was very quiet for a minute ; then, rubbing his head with his fore-legs, and giving a more ferocious twist to his antennæ, he came on again. Again he was knocked out, the mantis returning instantly on guard, and watching her other tormentor, who was again biting her legs and trying to sting.

For two hours I watched the battle. The mantis only struck when actually attacked, but never attempted to seize the hornets, which finally gave up the contest and crawled away amongst the olive-leaves. Next day I removed them, and gave her a good feed of flies.

A few days before this she had laid a large egg-case, fixed by a glutinous white cement on to a twig of the branch. I removed it, for I wanted to see the young before she ate them, as I guessed she would do, and in about a fortnight I had a merry brood of nearly a hundred tiny insects clambering round their box. They were fascinating little creatures, about a third of an inch long, exact replicas of their mother, frisky as lambs, and playful as the baby caterpillars of the puss-moth. I tried to feed them on a tiny green fly I found in the blight of an apricot-tree, but they would not take it. Finally I had to restore them to their mother's gentle care, which only three survived long enough to catch and eat a fly before they also were eaten.

For five months my mantis gave me endless interest and amusement, and she became well known. Flies were her constant and favourite food, and she grew more and more expert in catching them. Then one day I found her a mate. He was a dandy little fellow, sligher and somewhat smaller than she, and I rather trembled for his safety as I put him in the cage. She was eating a fly at the time, but stopped at once, dropped the half-devoured carcass, and went to greet him. They met on the netting at one side of the box, and looked at each other hard, waving their antennæ. Slowly he approached her, and gave her a gentle pat on the back of the head with his foot. She drew herself up, and signalled her disapproval of his conduct with her antennæ. He replied, and this time patted her on the back. Somewhat less outraged, she again drew away ; but he pursued her with his caresses, and I sighed with relief that the shrew was tamed at last.

Next morning he was dead. There was no sign of violence and no gaping skull, such as I was so accustomed to see. She never attempted to eat him, or anything else that day ; she seemed to be mourning his loss. For hours she sat with her forelegs raised in front of her, and with a gentle swaying movement from side to side, like a Mohammedan woman mourning by her husband's grave, she seemed for once to be fulfilling the rôle of a praying mantis. Occasionally she would move a foot ; her fly ration remained untouched.

Two mornings later I found her dead on her back, her life's work ended, and a huge egg-case fastened to the olive-branch. I took it gently away and fixed it on to her own old tree, where I hope all the eggs hatched out and the young grew up as lively and interesting as their mother.

MR PHIPPS OF 'THE OLD FIRM.'

PART II.

I.

I HAD slowed my restless madame for the sharp bit of uphill which would bring me almost to the house, and for sheer blitheness was speaking nonsense to her in French, she clattering nervously—I thought because she disliked the wind in the bushes—when, sudden as a flash, and for no cause that I could detect at the moment, old Sir Jacob's voice whipped into my brain.

'Are you that blackguard express from London that has hired all the horses?'

The question which I had not dignified to notice at the inn returned to me as something so weighty, so sinister, so full of import to myself, that straightway I pulled up, feeling sick in body and mind. Had I made a deadly slip by not guessing peril?

And now I knew what had roused the question. Right away on the road I had left I heard a faint, faint shouting; and between that and me a volley of hoof-beats; and—ay! on the turf to my left hand a drumming, getting louder with incredible swiftness—horses at a gallop.

'Those pack-animals are broke loose,' I said, cocking my pistols simultaneously and putting one in my breast. Holding the other, I grabbed the rein and endeavoured to discover the nature of the hedge on my right. It was dangerously high, and so, to the mare's amazement, I drove spurs into her and set her racing up the hill. Then, at the noise of crashing bushes ahead of us, I strove to wrench her in; and while she lashed and flung in wild frenzy, I heard the hedge behind us split in two places, and an instant after in a third.

'Jack is down and smashed with his lantern,' panted a rider; and, without pause, but his tone soaring to a yell, 'Name o' the king! Stand, Lord Sayer!'

At the hazard of firing my pistol into the sky, I brought both hands to the rein, hauled the mare part round, and goaded her at the hedge, not above four feet high here, but topped with stoutish bushes, just to be seen against the sky. We went into them, there hanging for an instant half-over, she scrambling madly, I thrown forward abuddle on her neck, and thinking, it is curious to recall, less of my plight than of my wallet and how lucky I was to have buried it, since there would have been no time for that from my first catching the alarm.

A heavy pistol went off in the road with a great, puffing blaze, the bullet chipping my elbow and getting me through my riding-boot fair in the knee. I snatched at the pistol in my

bosom, having by now lost the other, and fired back; and, this shot being returned at once, the mare gave a mighty heave, somersaulting me into the field below us, and so striking me as she fell herself as to knock the senses out of me.

II.

When I was conscious again I found that I was laid flat on the road, with several lanterns about me, and, I soon perceived, all my apparel disarrayed. My coat and tunic, boots and wig, were off; my shirt was ripped; and some one was yet busy with my stockings, which caused such torment to my knee that, had he not suddenly desisted, I should have swooned. As it was, he left me with the road seeming to billow like the sea and a horrid rushing in my brain.

I did not speak; but presently, feeling a trifle steadier, I listened very eagerly, for there was an angry discord among those around me which certainly meant nothing to my disadvantage.

'Your fellows were under my orders,' said a well-bred voice. 'Had he carried enough treason to damn himself ten times over, it were no excuse for them. Whereas now—— Look you!' He spoke in a new direction, and his words were high and menacing. 'Look you! my bullies. You shall remember breaking of my commands as long as you live, which will be till the next assize if his lordship dies. This is going to be jail for the lot of you to-morrow, you mutinous knaves.'

'So please your worship,' answered one, after a second of complete silence, 'the gentleman would ha' been away across country if Joe Hayward and me hadna' loosed our sneezers. We were trying for the horse.'

'His worship' reviled Joe Hayward and the speaker with a score of baleful epithets, renewing his promise of jail, and then, appearing to have turned his back on them, addressed the person to whom he had spoken before.

'I am put in a pretty mess, Mr Dawson, by you and your rascals. I did think I made plain what the Council directed—no harm to Lord Sayer, but to stop him on the coast and capture any boat crew that should row in to him. Pest! why did not they take him when they spotted him in London last week?'

The speaker's heel ground impatiently. 'I say again, the boat was moonshine. He was riding to see his wife, sir, not making for France. That should be clear even to *you*, seeing he lies at her gate with nought in his pocket but some jewels for her.'

'I believe he has cast away his papers,' was

the answer, obstinately made. 'And, come daylight, I will have my lads search every rut and cranny of this lane.'

'Come daylight, you will have your lads in prison—as true as I am a magistrate—for landing me with this murderous business.' His heel began to grind again. 'Hey, Brown! get you off also for a surgeon. Try Sandwich—back to the big road, then left. Whoa! Give me that flask again first.'

And then he came and bent over me so that, although my stupor was returning quickly, I recognised his face. He was Mr Francis Orlebars, of Greenwich, with whom I had been friendly in the old days. He caught the gleam of sense in my eyes, and forthwith dropped on his knee, raising my head.

'My dearest Sayer,' said he. 'In faith, I am sorry. I meant to take you myself, but your swerve from the straight road confounded the numskulls that were my patrol-parties and brought them ramping after you—nay, drink.' But I could not, and he stooped closer. 'Sayer, the knee is the worst?' he asked anxiously. 'You are not crushed—broke inside?'

The sweat was now running all over my face, and I heard his words but as sounds swaying up and down giddily. 'I know not,' I struggled to say, 'but—in case—carry me to my lady.'

I saw blackness sliding over me as a lid, and well I remember with what agony I tried, in the last blind moment of consciousness, to cry on Ruth to come to me.

III.

I won round again, my brow and mouth very aromatic from strong waters, in a large room bright with fire and candles. It was strange to me, but as I moved my head I got a little fragrance from the pillow of the bed whereon I lay, which was the sweetest fragrance in the world. And in wonder I thanked Heaven for this joy in my trouble, that Ruth deemed me not too much of a shifty plotter and a stranger to be laid on her own bed, which I could have sworn she would have. I looked for her, yet saw only a maid-servant at the end of the chamber, and Orlebars, who, noting me stir, motioned out the woman and stepped across to me.

'Your wife is coming,' he said, after a question as to how I felt, 'and soon the surgeons will be here, I trust. I have bound your knee and arm, and looked to the rest of you. You are all bruised, but I believe the knee is the only breakage.'

I lifted my left hand, the other arm being gone stiff, and we made a long grip of it while I thanked him.

'I shall take my people to the village yonder,' said he; 'for I am too sick of this affair to intrude on you and my lady. But you are under my

arrest, and I must have your pledge that you will not contrive to—forgive the word, Sayer—to escape.'

I hesitated. Should I barter every remnant hope of freedom, perchance of life, for a few unwatched hours? Yes; I had no other choice.

'I pledge myself,' I said, wondrously relieved at his going. Then, aware how ungenerous he must consider me that I did not press him to stay, I added sincerely, 'You have proven kind indeed, Orlebars.'

He stared down at me, twisting the end of his peruke, and wearing the pleasant expression of old acquaintance. 'We found no treason on you,' he said, 'so think not of danger to your neck, which might easily have been, despite your peerage. I fear, from rumour, it may be the Tower, though. Yet I fain would leave you cheery.' He debated within himself. 'Sayer, let me have your plighted word on another matter. Came you to England for none other purpose than to visit my lady? Tell me that, and I will see if I can end the process.'

I was tempted hard. To remove his very suspicion for the night—he appearing to know nothing of my work in London—would be of extreme use to me. In sooth, I was tempted. Howbeit, I shook my head.

'Betwixt you and me,' I answered, 'there was something else.'

He frowned uneasily, and then, with a sigh and a smile, 'So be it. Every man for his own king.' He touched my hand. 'Good-bye; your wife is come.'

He drew aside, and, making his bow towards the door, walked thither. I heard him speaking on the threshold, and presently the door was shut and Ruth came quietly down the room. With not a glance at me, whose heart started to leap again so that it seemed my whole body shook, she stopped and remained side-face to me, looking at the curtain over the window as one in profoundest meditation, her hands striving a little with one another. She was pale, but otherwise little different from the day I first saw her—a very naiad in her slim youthfulness and beauty—for the desolate years which had brought my age to forty-one had brought her to but six-and-twenty.

She deliberated, her hands ceasing after a while to strive, and becoming clasped, rigid as stone hands, I thought. Then suddenly she cast them apart, with a long breath like a sob, as if she regretfully abandoned something; which made my perplexity complete, until she turned—and then I saw in her face that by a miracle it was the Prince of Orange and his party that were gone by the board with her.

My rapture at that instant was such as I had never imagined could be; but, my conscience telling me it was selfish withal, she

being plainly in grave distress for me, I made to raise myself, to show her I was not near dead yet. Thus far, with my swoonings and with my mind planning industriously and none too clear, I had most the while been numb, as it were, to bodily pain. Now, having lifted my shoulders an inch, I dropped back, crying out loud, ready to believe that swords were passing through me.

She ran forward, picking up a cup from a chest, and would have urged me to drink, but her lips were quivering rapidly.

'I am all right, sweetheart,' I whispered. Whereupon she put the cup away. Then, leaning over and setting her hands on either side of me, she came down low, with supreme care not to press me, and rested her lips on mine, holding them there for long intervals, between which she would hold back her head a space, with a moan, her blue eyes as dark as night and aswim with tears, and seeming to entreat me to read her soul.

I got my well arm around her, calling her by all the dear names which she had not let me speak in these late years; and anon she swayed over in it and sank beside me; and her sobs, which had begun to shake her, changed to a steady weeping against my cheek. I suppose I wept myself, for it was with but a quivering voice that I applied myself to soothing her—no easy matter.

'Dick! Dick!' was all she would murmur for a while—'Dick!' And then would be flows of

words, scarcely to be heard, yet beyond my power to stop. 'I was your cruel wife—the cruellest wife that ever has been. . . . King James was your friend. . . . I should have remembered that and forgot poor Cousin Luke. . . . I think some demon took my mind, for I never but loved thee, my own. . . . Oh, Dick, when I took this house that was filched from you, it was not solely for want of a roof, but to save something for you and me. . . . They offered me Sayerston, or Sayer House. I were best have chosen from those, but I could endure none except this. . . . You had not lived here, so I believed you would not haunt it. . . . But you did, my heart! . . . Think you I slept those nights when you had ridden to your ship?

'My dearest, I meant to be hard and hard and pitiless till at last you should bend and wear orange. I knew you loved me. Ay, I knew you would not seek another woman. . . . Oh, cruel! cruel I was! . . . I dreamed so pleasedly of your bending, of my game won. . . . And then, when they came with you to-night!' She broke into frenzied sobs, shuddering piteously. 'To-night I believed that God had rended me for never thinking how—how death could stop my game! Dick! Dick! you will not die!'

'Die! Not from this bit of winging, sweetheart.' And at length I managed to comfort her, that paroxysm proving the last of her weeping.

(Continued on page 106.)

THE SWEDISH NIGHTINGALE.

By JAMES A. MANSON.

I.

'TWAS on a summer's afternoon, A wee afore the sun gaed down,' in the year 1829, that folk passing the Widows' Home, in a thronged street in Stockholm, were thrilled by a beautiful bird-like song. The maid of Miss Lundberg, a dancer at the Royal Opera House, was so enchanted that she had the good sense to inquire, and learned that the melody proceeded from a little girl sitting at a window singing to her cat. She told her mistress of the incident, and Miss Lundberg begged the mother to bring the bairn and let her hear her. And so it was done.

'This child is a genius,' Miss Lundberg protested; 'she should be trained for the stage.' But the mother objected to the theatre. 'Well,' remonstrated the dancer, 'at least have her taught singing.'

It then appeared that the little girl, aged nine, was named Jenny Lind (her baptismal names of Johanna Maria she never used). Her gift was natural. She trilled in bird-notes, for

the music came. As she said herself when much older, 'I sang with every step I took, and with every jump my feet made.'

Her granny, Fru Tengmark, first noticed her talent when the child was about four. Jenny had just returned to Stockholm from the country, when she heard the bugles of a military band play a bright and lively air. Thinking herself alone, she stole to the piano on which her step-sister Amelia used to strum, and played the tune. 'Amelia!' cried granny; whereupon Jenny, as if caught in wrong-doing, hid behind the piano. Granny, receiving no answer, entered the room and discovered the culprit. 'Was that you?' the old woman asked, as she drew the child from her hiding-place. Jenny owned her guilt, and granny presently informed her mother, adding, 'Mark my words! That child will bring you help some day.'

Fru Tengmark's prophecy was fulfilled both in letter and in spirit. Although Mrs Lind was hard to get on with, and Jenny at last had to leave her because she thought they would agree better apart, she supplied her parents' wants, and

provided them with a haven of rest and comfort for their declining years.

II.

Jenny had a will of her own, and great force of character. She owed nothing to appearance, describing herself as a small, broad-nosed, ugly, awkward, shy girl; but as she grew up she developed some splendid qualities. One was abiding faith in God; another was firmness of purpose; a third was unbounded love for the poor, the outcast, and the ailing.

Although nearly her whole life was spent in busy cities, she had a rooted distaste for crowds, and an equally intense love of nature. All her days she cherished wild-flowers, revelled in the song of birds, rejoiced in sky and cloud and sea. 'I have a hole in my heart even for ze leetle mouse,' she once declared—which, considering her sex, was sufficiently remarkable. Folk-songs, folklore, folk-stories, and folk-dances had for her a ceaseless charm. When she sang at a 'musical evening' given by the Dowager Queen of Sweden in 1850, Her Majesty asked her to accept a costly bracelet. With tears in her eyes, Jenny entreated to be allowed to entertain without other fee than a bunch of forget-me-nots in a vase on the table. The queen yielded, and, as an eye-witness recorded, Jenny seemed happier with the flowers than with the diamonds.

Questioned as to the school in which she had studied, or the master to whom she was most indebted, she answered, 'My ideal was and is so high that no mortal was to be found who could satisfy my demands. I sing according to no man's system, only after that of the birds, so far as I am able, for their Teacher was the only One Who responds to my requirements for truth, clearness, and expression.'

Of course, Jenny did not mean to imply that she had had no training at all, for her mother was wise enough to act on Miss Lundberg's advice and take her to Croelius, the singing-master at the Royal Theatre, who in turn led her to Count Puke, the director. 'How old is she?' the latter asked; and on learning that she was nine, he said, 'Nine! This is not a nursery!' 'Ah, if you won't hear her,' replied Croelius, 'I must teach her myself, and she will astonish you yet.' Then the count relented, and Jenny sang, and moved him to tears; and in the end she was bound for a number of years to the Royal Theatre, which undertook in return to feed, clothe, board, and educate her.

This decision was not come to, however, without serious misgiving, because Mrs Lind (like Jenny herself in later life) had a profound horror of the stage and all its surroundings. Yet, strange to say, Jenny Lind attained to such success that many critics averred that, had she not been the finest singer of the day, she might have become

the foremost actress. This was due to her extraordinary power of identifying herself with the character she was personating, whereby she actually *was*, and did not merely pretend to be, the person. She told Mrs Nassau Senior she hardly ever thought of the effect she was producing on the audience, for if ever such a thought did cross her mind it ruined her acting. When she acted, she entered fully into all the emotions of the part she was sustaining. If she could not do this, as had happened on rare occasions, she assured Arthur Stanley, afterwards the well-known Dean of Westminster, 'she felt she was acting, and telling lies, and then entirely failed.' At the same time, she was so anxious not to destroy her individuality, lest with it all that was good in her might perish, that she made it a rule 'never to represent such passions as would awaken bad feelings.'

Readers of the admirable *Memoir of Madame Jenny Lind-Goldschmidt*, by Mr W. S. Rockstro and the late Canon Scott Holland, will discover it easy to penetrate the secret of her attitude to the stage. Lady Taylor, wife of Sir Henry Taylor, the poet, met her one evening by the seaside, gazing at a glorious sunset, while a Lutheran Bible lay open in her lap. They fell into talk. 'Oh, Madame Goldschmidt, why did you leave the stage at the very height of your success?' 'When, every day, it made me think less of *this*,' answered the singer, as she touched the Book of books, 'and nothing at all of *that*,' as she pointed to the gorgeous panorama in the clouds, 'what else could I do?'

But such sentiments needed time and experience to ripen into all-compelling conviction, and little Jenny proved an apt pupil at the theatre school. Always diligent, she rapidly became a proficient dancer, and her walk and carriage were perfect. In spite of an injury to her left hand, which she hurt whilst striking a flint on tinder to get a light, she mastered the piano, and played the accompaniments to her Swedish songs with singular delicacy and refinement. She took a special pride in sewing, an art she constantly cultivated. 'Madame's stitches never come out,' commented her maid in emphatic eulogy.

Almost from her earliest connection with the Royal Theatre, the manager began to cast Jenny for child parts, and so precocious was she that she speedily came to be regarded as a regular member of the company. Between the school and frequent appearances on the boards, several years had elapsed before she was heard in opera. But on 7th March 1838 she made her début as Agatha in *Der Freischütz*. In a rehearsal she sang and acted with such fervour as to electrify Madame Erikson, her teacher, who sat mute with astonishment. Jenny had looked for a word or two at least, if not for applause. 'Am I incapable and stupid?' she wondered.

Then she saw tears welling up in Madame Erikson's eyes. 'My child,' the latter faltered, 'I have nothing to teach you; do as nature bids you.'

In her *début* she won a triumph, and went to bed that night a new creature, certain that her gift was from Heaven, and that she was charged with the high responsibility of making proper use of it. This sense of divine possession never forsook her. Mrs Stanley, wife of the Bishop of Norwich, with whom she stayed in 1847, testified that 'every morning when she got up she felt that her voice was a gift from God, and that, perhaps, that very day might be the last of its use.'

Though she had gained a brilliant position in Stockholm—she was appointed Court singer when little more than nineteen—Jenny's dazzling advance led her to suspect that she knew more than her teachers could tell her, and she resolved to consult a foreign coach. With this object she went to Paris in 1841 to see Manuel Garcia, one of the most skilful teachers of voice production. His opinion appalled her. 'Miss,' he pronounced, 'you have no voice left.' This blunt judgment she could not accept as final; but she was aware that it contained an element of truth, and that her trip to Paris had been justified.

Garcia, anxious to relieve her feelings, said that if she did not sing a single note for the next six weeks, and spoke as seldom as she could, in order to give her voice complete rest, she might call on him at the end of the period of abstinence. On her return he was so far satisfied with the improved condition of her voice that he agreed to teach her, provided she unlearned all she had been taught on wrong lines and began her training over again. For nearly a year the lessons continued, until, aided by her indomitable will and adamant faith in the divine origin of her gift, she was enabled to resume her career. Rather she was starting afresh, for she soon became a world's wonder. Mendelssohn, who wrote some of the soprano airs in *Elijah* with her voice ringing in his ears, avowed, 'She is as great an artist as ever lived, and the greatest I have known.' Thus she who had begun as the Child of the Drama became, in course of time, the acknowledged Queen of Oratorio.

III.

Notwithstanding her rare accomplishments, however, she was a singular mixture of self-confidence and self-distrust. She was sometimes difficult to manage in business matters. A creature of mood and impulse, she had to be saved from doing, on the spur of the moment, things which were neither to her own interest nor to the benefit of her art and that of the multitude of music-lovers. She was once on the point of signing a contract for eight years as

prima-donna to the Royal Theatre, Stockholm, for the paltry salary of £420 a year. In effect the agreement would prevent her from touring in the various European capitals, whose inhabitants were eager to hear her, and might even jeopardise her future. But she obstinately refused to listen to any advice. One day a friend met a consul-general well posted in musical affairs, and lamented to him the step Jenny was about to take. 'Surely she must know best,' said the wily consul. 'In spite of her wonderful successes here, she feels she could not repeat them abroad, and so decides to remain at home.' In this shrewd point of view the friend saw salvation. He hurried to Jenny, told her what competent amateurs were saying, and, before the interview was over, saw her tear up the contract.

Compare this with her nervousness after the curtain had fallen on her brilliant singing as *Velka* in Meyerbeer's opera of that name, which was produced in Vienna on 18th February 1847. A friend found her in her dressing-room inconsolable at her imagined failure. At that moment the composer himself knocked at the door. 'Forgive me,' cried Jenny as he entered, 'for singing so badly and spoiling your opera.' 'Indeed you sang divinely,' Meyerbeer answered. 'It was splendid, and I have come to thank you.' But she would not be comforted; she had made up her mind she had not reached her self-appointed standard, and it must either be that or nothing.

Her diffidence was genuine, not assumed. She loved to listen to the nightingales at Burnham or Wimbledon along with her friends the Grotes. On one fine evening a bird suddenly stopped his song on ascertaining he was not alone. 'He has seen us,' quoth Jenny. 'That is just like me. Had I caught any one intruding on my solitude, I should have done the very same. Those who have likened me to a nightingale are not far wrong, for I have a great deal of the nightingale in me.'

Everybody agreed that her voice had quite a remarkable quality. Arthur Stanley, who had no technical knowledge of music, told her once that her singing, in itself, produced no effect on him, but that there was something extraordinary in her voice. Others were, however, more impressionable than the coming dean. Hans Christian Andersen says that, during one of his visits to Berlin, he received a visit from a man who was a true poet, but upon whom poverty had laid a heavy hand. Wishing to give him a treat, Andersen invited him to hear Jenny. 'I have heard her already,' he answered. 'Not being able to pay for a place, I inquired whether I could not be employed on the stage as a "super" in *Norma*, and was permitted to serve. Dressed as a Roman soldier, I was stationed near her, and heard her better than any one else. How she sang! How she acted!

I could not stand it, and fairly blubbered. They were mad at that, and the manager would not suffer me to appear again.'

In Edinburgh she once sang in aid of Dr Guthrie's Ragged Schools. 'I then heard her for the first time,' the doctor wrote long afterwards, 'and never heard—and, unless I hear her again, never shall hear—anything like it. She sang "Auld Robin Gray," and old men near me, with heads as bare as a peeled turnip, were greeting [crying] like bairns.'

IV.

Her charities were endless. She did good by stealth, and blushed to find it fame. One of her guardians who managed her bounties in Stockholm kept all her letters, and these, at his death, were found in a parcel labelled, 'The Mirror of a Noble Soul.' Monsieur Bournonville related a pathetic episode for the truth of which he vouched. While Jenny was singing in Copenhagen in 1843, a friend of his, Mozart Petersen, lay sick unto death; but, ill as he was, the talk of her marvellous singing had reached him. Petersen's young wife expressed her sorrow that her poor husband should miss hearing the famous singer. The case happened to reach Jenny's ears, and she visited the couple one Sunday and sang to the patient. The enraptured pair, hearts full of gratitude, called her 'the Angel,' unconsciously echoing Sir Walter Scott's tribute to woman:

When pain and anguish wring the brow,
A ministering angel thou!

What her magic voice earned in money for hospitals, infirmaries, and scholarships in music will never be known. She gave a concert on behalf of the Consumption Hospital at Brompton on 31st July 1848, which produced £1776, 15s. A new wing of the building having been erected, Douglas Jerrold proposed that it should be called 'The Nightingale's Wing.' The proceeds of concerts which she held for philanthropic objects during a period of some nine weeks (4th December 1848 to 2nd February 1849) amounted to £8740.

Her purse was always open to the poor and the distressed. Often she left her house, apparently to make a call, but really to trace out cases of hardship with the intention of affording relief. To friends who cautioned her that she might readily be imposed upon, she answered, 'If I help ten, and one is worthy, I shall be satisfied.'

Whilst singing at a concert Madame Solari unfortunately broke a blood-vessel, and her life was despaired of. As a last resource she was ordered to the south of France, but lack of means seemed to render this impossible. Then Jenny heard of her troubles, and called. 'I have come to scold you,' she began, 'for not telling me before, and for thinking of going away without seeing me. You will need money.

Take this, and never forget, wherever you are, that friends have only one purse. God bless you!' So saying, she handed the sufferer two £100 notes.

When Jenny Lind was in New York she received a letter from a Swede asking the favour of an interview. She could not recall him from his name, but granted his request. When he entered her room she identified him at once as an old schoolfellow, and learned that he was now a cabinet-maker, living in Brooklyn with his wife and family. Next day she drove to see them, repeating the visit on the following day. On the second occasion the man was not at home, but she left a letter for him, begging to be allowed to give his children a memento of their father's youthful friendship with Jenny Lind, and enclosing a cheque for £2000!

Robert Schumann's songs she interpreted to perfection, entering into the spirit of them with a completeness that had seemed really unattainable. She had a particular fondness for his '*Sonnenschein*,' and when the composer told her that her singing of it made him feel it warm on his back, she retorted, 'But Who was it that caused that sun to shine?' This was, in fact, the last song on which her memory lingered. As she lay dying at Malvern (where she passed into the Land of Eternal Song on 2nd November 1887), her daughter undid the shutters one morning and admitted a glimpse of the newly risen sun. Jenny Lind's lips were seen to form the opening bars of her favourite melody, and ear of man or woman heard her on earth no more.

SHADOW LAND.

ONE, two, three, and four, five, six,
Slowly and gently the big clock ticks;
Time each little downy head
Lay on a pillow safe in bed.
Now is the time that the fairies swing
To and fro within their ring;
Big owls hoot with eyes so bright—
To-whoo, to-whoo, floats through the night;
Froggies sing and glow-worms flit,
Lighting up the swamp a bit.
Now the little goblins dance,
And the White Foam Horses prance;
Soldiers of an age long fled
All return when you're in bed.
Crews of Drake and Nelson too,
Come to have a peep at you;
'Cross the nursery, rushing on,
Charge the steeds of Wellington;
While he, riding at their head,
Gallops gaily by your bed.
All these things from goblin lands
Grasp ye with your childish hands.
Hold them well, then, while you may;
You have but short time to play.
And, ere many years are past,
You must sadly say at last,
To the myths you love so well,
Friends of Childhood Days—Farewell.

Chambers's Journal

SEVENTH SERIES

THE RETURN.

By OTTO ROTHFELD, F.R.G.S., I.C.S., Author of *Indian Dust*, *Life and its Puppets*, &c.

PART I.

I.

HE sat, half-crouching, in the corner-seat, with his eyes fixed upon the hedges and the telegraph-posts that glided past, as he had sat all through the night, ever since the train left the noisy, crowded, flaring Grant Road Station in Bombay. Now, in the cooler dawning that followed the restless night in the stuffy third-class carriage, the stations began to bear names that sounded vaguely familiar, with a sort of distant touch of home and an accustomed turn of tongue. Surat, and half-an-hour's stoppage; Ankleswar, where the locomotive took water; the long railway bridge across the sacred Narbada; Broach, with its ancient walls rising straight from the river, and the masts and sails clustered thickly in its port; Palej and Miyagam; and the large station of Baroda—these were names that spoke to him, in a dim, unimagined way, of things which he once knew, of a land that at last was his very own. As the morning hours again grew hot and parched, and the sun beat down fiercely upon the iron rails and stone ballast of the permanent way, till the very air seemed to tremble and the white glare of the dusty roads became like a flaming sword, he saw before him from his corner the park-lands of Gujarat, the mango-trees heavy with fruit, the hedges of cactus and thin green euphorbia hung with dried trailing creepers, and the deep sunken lanes that led from village to village. The carts that moved on these roads were long and high, with great creaking wooden wheels and heavy axles, and were drawn by large white bullocks of the Gujarat breed, taller to the withers than most men, with long dewlaps and fat humps and high-twisting horns. There were brass bells hung to the collars round the beasts' necks, and the sound of their soft clashing tinkles seemed to recall the past, as if once, long ago, he had known these very bullocks and driven them back across the fields to the village gate and his mud-walled hut. He stirred a little in his seat and looked quickly round the compartment. But the others, busy with their chattering and eating, seemed to be somehow distant, men and women whom he did not know. He unrolled the corner of his turban and took out a country-made cigarette—a pinch of tobacco twisted in a green jungle

No. 477.—VOL. X.

leaf—and turned again to his window. When the train stopped at another station, he could hear the familiar creak of the wheel at the well, as the bullocks pulled up the leathern bag of water to the drinking-trough at the surface.

'How, brother'—he turned to the man beside him—'this must be Kaira district, isn't it?' The provincial dialect sounded a little strange, a little laboured, on his lips. His neighbour stared at him curiously.

'Surely, brother,' he replied. 'This is Kaira district. The last station we stopped at was Anand. Next we come to Mehmedabad. After that will come Ahmedabad district. Truly, a wonderful thing is the fire-carriage.' Then, after another look, he went on in the easy give-and-take of the third-class passenger. 'And where do you come from, brother? You would seem to be from the Chunwal, yet you speak Gujarati as if it did not come easily to your lips. Have you journeyed from far?'

But the man had turned again to his window, and granted an unwilling answer over his shoulder. 'I come from far away. From there, over there, have I come,' waving his hand vaguely to the south, in the direction of the ocean, as he spoke. Then he hunched himself yet more together, as if resolved to speak no further.

The other shrugged his shoulders, half-offended; then, catching the eye of the girl who sat opposite, a pretty Benia girl with full pouting lips and plump arms and neck, her first-born in her lap, on a trip away from her husband to visit relatives in northern Gujarat, he curled his moustache and smiled. With a pretty girl to watch and a daring eye to meet, it's a poor sort of man that would worry about a surly fellow on a railway journey.

II.

The man, quietly crouched in the corner, still looked out dully upon the moving sun-browned landscape. His was a worn, tired, patient face, the face of one who had passed through a purgatory of blazing passions to the slow, unconscious repose of mere fatigue. The straggling hairs that peeped below his loosely wound turban of coarse cotton, the moustache, and the unshaven stubble on his chin and cheeks were coarse and grizzled. The mouth hung loose, showing brown worn teeth

[All Rights Reserved.]

JANUARY 17, 1920.

and gaps in the pallid gums. The wrinkles on his brow and fallen cheeks spoke of ill-health and listlessness, corrosive of earlier force and virility. He might have been robust once, it seemed, with a ready flash of emotion and a zest in life, in the mere activity of living; he was but a spent thing now, jetsam of the drifts and the breakers.

They were in Ahmedabad now, in the mean sordid station that is the entrance to the capital of Gujarat. He watched, unthinking, in a daze of undistinguished sense-impressions, the jostling crowds that hurried and pushed and shouted along the narrow platform. Bearded Marwan labourers with iron-bound cudgels forced their way through, followed by their stalwart women in torn and filthy accordion-pleated skirts, shawls pulled over the face, infants clutching at the bared, deep breasts. Thin-lipped merchants, in fine muslin loin-clothes and smooth made-up turbans of green and gold, edged carefully through the throng, repeating Stock Exchange quotations and offering mill-shares of 'forward' cotton. Bohorah women, closely veiled in dingy sheets from head to foot, stumbled along in clinging groups, a fringe of green or purple silk petticoat just visible over the flabby ankles and shuffling slippers. Parsi and Eurasian ticket-collectors jostled the people, men and women, rudely aside, and policemen and customs officers opened bundles on the platform or ran gauging-rods into bags and baskets.

Through the dim monotone of sensation, one recurring image shaped itself to his sluggish mind. He saw as in a vision a young man, a Koli of the Chunwal Kolis, a dashing, fighting, cateran race, in the first bloom of youth and manliness, swaggering gaily through the walled village of his early years. Facing him came another, one whom he hated, dark and grim, the features now blurred and lost in the mists of time. Words he remembered, sharp and bitter; a curse; a blow—and the rest was only a faded smudge of dulling pain. But clear to him was the image of the young man, gaily swaggering; and he knew that the figure was himself.

'Buy some sweets, cooked by Brahmin hands, old gentleman?' whined the voice of a girl vender at his elbow.

'Old gentleman!' He came back from his vision to the flow of present sensation. It was to him, then, that she was speaking. 'Old—old! Am I, then, old?' he asked himself. His fingers felt dubiously in a weak way round his chin. 'That young, straight figure—was it ever mine? Old! Of course I am old—now.'

He shook his head and spoke to the girl in the curious laboured tones that seemed to be habitual. 'I want no sweets, my daughter. Go to others who are younger or richer. Go, and God send you sell your wares well.'

III.

The third-class carriage was full again, mostly with new-comers who had taken places as others

left at Ahmedabad station. For the most part they were of Kathiawar—Rajputs and Kathis and Kolis—travelling to their homes in those plains and salt-marshes which run westward to the old seaway from the rich loams and fertile tillage of real Gujarat. The sing-song of their western intonation came soft and soothingly to his ear.

When the train started, they steamed slowly beside cactus-hedges and ruined mausoleums till they passed the level-crossing on the broad cantonment road, and rattled noisily across the long railway-bridge that spans the sandy bed of the Sabarmati River. From the carriage window could be seen, below on the left, files of camels and pack-oxen, and men and women walking laboriously on the heated, heavy track, or cooling their feet and drinking at the narrow stream of water that trickled slowly under the sun's hot rays down the great width of sand during the summer months. Underneath the bridge at the shallow water's edge naked boys stood with outstretched fingers to catch the copper coins flung by the pious as an offering to the kindly river. On the other bank, at the brow of the slope, surrounded by broken ground and stunted acacias, rose a high brick wall, with the roofs of buildings showing above the enclosure.

As it came into sight there was a murmur of excited talk in the carriage.

'See, brother,' said the Mussulman butcher, pulling his neighbour's sleeve; 'that is the Government Central Jail. That is where Government sends those who commit crimes.'

'Ay, it is an evil place,' exclaimed another, a Rajput *squireen* from the west. 'A servant of mine was sent there for some mistake about a cow. It is an evil place, and there is much flogging therein.'

'Is that where women are sent, too?' asked an old lady, leaning over to catch a better glimpse. 'What a place for a woman! Better to be a widow than to suffer within those walls.'

'Quite right, mother,' cried the fat butcher who had first spoken. 'It were even better to have a roving husband. It's worse sleeping in jail.'

The old woman bridled and prepared for the verbal combat that her soul loved. 'Is that even so?' said she. 'Well, of a surety thy wife should know. But perchance she keeps such a watchful eye on thee that thou canst not rove far.'

The others laughed and clapped. But, in his corner, the traveller neither heard nor spoke. His eyes fixed themselves on the blank brick walls, till they faded out of sight. He seemed almost to shrink physically as he looked, and his eyes were the eyes of a beaten dog.

IV.

Still the train rolled on, while the aspect of the country changed and the trees grew less and less, and rough broken land stretched mile after mile by the side of the railway-line. At the

fourth stop the man rose, picked up his stick and bundle from the floor, and got down upon the sunny platform of the country station. As he gave up his ticket and passed through the gate, a road stretched its white length straight before him. He stood upon the entrance-stop and looked upon the parched land, over which the heat vibrated in waves, while the great brown plain seemed to reach, barren and limitless, to the rising and the setting of the sun.

'The road to Avlash, please?' He turned to the ticket-collector, who was also station-master and telegraph-clerk. Living in small brick quarters beside the station office, this official spent his time in scheming for a transfer to a bigger town and a less torrid climate.

'To Avlash?' he replied, astonished. 'What do you want in Avlash? It is only a little village of forty houses, and the women have to go two miles across the fields to fetch water. Avlash! Why, God be merciful, they eat dust there in place of grain, and even the dogs go mad! Have you relations at Avlash? If so, win merit in the eye of God, and remove them to your own place.'

'I have business at Avlash,' said the old man. 'I must go there. And I do not remember the way.'

'You do not remember the way?' replied the station-master. 'Most men who have been there would fain forget it, as I would only too gladly forget all this accursed country and its drought and its mosquitoes and its dust-storms. Krishna forgot this place when he honoured Dwarka. And when were you at Avlash last? I do not know your face.'

'It's twenty years now since I saw it last,' replied the other. 'Twenty years—and since then I have seen other skies. I have seen forests, and seas, and strange flowers, and stranger birds. But why talk of what is past? Direct me, if you would be so kind, and let me again behold Avlash.'

'Well, well!' answered the station-master, 'if you must go, there is no help for it. It is six miles from here. Take the broad road first till you get to the culvert across the dry nullah where the water pours twelve feet deep in the rains, and then follow the cart-track that goes off to the east till you come to the village. But drink some water first. You are an old man, and seem weak. You will be thirsty enough on the road.'

The other thanked him, drank, and turned to go.

'Is Avlash your own home, perchance?' the station-master cried after him.

'It was my own home once,' he replied, and waved his hand. 'It is to be my home again.' Then steadily he set his feet to the high-road.

V.

'Now, I wonder who that was,' said the station-master to his wife, as she waited on him at the midday meal. 'He seemed old, and yet

not altogether old—rather worn out and fatigued. And his tongue had the right note and twang, and with it all an odd sort of falter, as in one who is used to speak other language. And he was a Chunwal Koli, I feel sure, but he seemed as if he had strayed into a country with which he had long lost touch. A curious man! I wonder who he was.'

'Likely he has been across the waters on a voyage,' suggested the wife.

'A voyage? It would have had to be a long one,' said the husband. 'Nor has he the look of a sailor.'

'Why not the black waters?' she retorted. 'The black waters over which Government sends robbers and murderers?'

The station-master stared at her with enlightenment shining in his eye. 'You are right,' he cried, 'mother of my son. That is what he must have been. One returned from transportation, I do believe. Well, well, poor man! he has suffered. But I must talk this over at once with the *jamadar* of police. Won't he be surprised when he hears I have detected a convict!'

VI.

In the meantime Dayal Rajha, Koli and ex-convict, strode steadily along the road. The summer heat struck his face like a buffet and a furnace; his breath seemed to catch at his throat in a gasp. Even through the thick country shoes that he wore he could feel the road at each step burning and blistering the soles of his feet. The crown of his head seemed baking under the coarse cotton turban, and his eyes felt as if reddened with fire. In the distance the mirages of the wilderness mocked him with hazy expanses of water and the shadowy forms of umbrageous trees. Before him lay only the dust of the long, blank road, and at its side the gaping cracks and shrivelled thickets of a barren land. A growing, burning thirst gripped him by the throat like a living thing. He moved his feet mechanically, almost unconscious of action, in the dull monotony of effort. At times his eyes half closed; some trick of subconscious self would bring him the memory of great tropical palms and green coco-nuts, and the rustle of moisture-laden breezes through the spice-trees and the long slow swell of an idle ocean. He opened his eyes to the realities of the home from which he had been deported, long years ago, in the young strength of manhood, the home to which, by years of good conduct and patient perseverance, he had striven to gain a last return.

He came at length to the culvert to which he had been directed, and turned off upon the rougher tracks of the country-road. The brown earth came as a relief after the white glare of macadam. For a few minutes he sat down, his bundle at his side, and tried to rest. He could see a chameleon panting on a twig at the wayside, the evasive colours at its throat heaving

rhythmically at each breath. But Avlash was near now, the end of his long journey, and he was restless under the need of attainment. He rose again speedily, balancing the bundle on his head, and went on, as if refreshed by expectation, upon the last stage of his way.

It was past noon when he reached the village, and saw, with a catch of his breath, the walled gateway, where he remembered long hours spent as a boy, seated beside the village watchmen on the stone platform of the porch, while they yarned of bygone raids and cattle-liftings. He paused where the road dipped downwards over the stone threshold, and looked upon the village street. Before him were the mud-walls of clustered verandas, the corner-stones, the colourless dust and refuse of the little village. Where projecting eaves cast a faint line of shadow, stray dogs lay sleeping, with mangy coats and scarred heads and sides. Steeping in the stupor of the hot hours of the day, the place seemed soundless, and the very pigeons in the village dovecot were asleep. It might have been the habitation of a dream. The stillness lay upon him like an oppression, and it was with a struggle against impending fear that he moved slowly towards the houses of his kinsmen.

VII.

As he turned past the tumble-down quarters of the village sweepers, poor wretches who were as scavengers and messengers for the community, one roused himself with a yawn from his siesta, and sat up unclothed at the low door of his hut.

'*Arè, kon hai?*' he cried. 'Who are you, stranger? Whom do you want, and whence have you come at this hour?'

Dayal Rajha stood and looked towards the sweeper. He saw only a youngster, one who must have come after his time.

'I am looking for friends,' he answered. 'I know the village. I will find the house myself.'

'No, no,' replied the sweeper. 'That will not do. I have never seen your face in all the years that I have served the village; and if you have friends, why are they not here to meet you? Why have they not spoken of your coming? And, if your errand be good, why should you steal quietly into the village at the midday hour, when all are asleep?'

Dayal made a movement of weak irritation, but brought an apologetic note to his answer. 'I came by the morning train,' he said, 'and I walked over at once. My friends do not know that I am coming, and it is years since I was last at Avlash. I left it long before you could remember. But I know the place and the house, and I mean no harm.'

The sweeper shook his head dubiously. 'I think you had better come with me to the village headman,' he replied. 'Let him hear your business, and then I have nothing more to do with it. What trouble that you should

have come at this hour! It is too hot to move, anyway, and the headman won't be pleased to be roused from his slumbers. He has a young wife, too. If I am beaten it will be your fault.'

Dayal Rajha squatted down on the road, unrolled his turban, and took out a four-anna piece from its folds. The sweeper followed the gesture and went on in a kindlier tone.

'At least tell me whom you are going to visit. Perhaps, if I hear the name, it will be all right, and I can let you go.'

'I go to the house of Dayal Rajha,' answered the other slowly after a moment's hesitation.

'Dayal Rajha?' said the sweeper. 'But there is no Dayal Rajha in the village. What do you mean? There is Dayal Jaya, and there is Dayal Mansing, but there is no Dayal Rajha, and never has been. This does not look well for you, old man.'

'I did not say there was a Dayal Rajha here,' the other replied patiently; 'but I said I was going to his house; and his house there must be. What should have come to his house? He left Avlash twenty years ago, that is true; but he had his house and his wife and his infant son.'

The sweeper scratched his head and thought. After a while he spoke again. 'You cannot be thinking of Jetra Dayal, can you? There is a young man of that name, a Koli, who is about twenty-one years of age, and was married last year. His father went to the bad and murdered a man, and was transported across the black waters. He must be dead many years ago.'

The old man had winced as the sweeper spoke, and it was with difficulty that he replied. 'Ay, surely it is of Jetra Dayal that I speak. It is to him that I wish to go, and it is his house that I seek.'

'Very well,' said the sweeper, 'if you want Jetra Dayal, that is all right. But his house lies not in the direction you are going, but here—this lane to the left. It is the fourth house on the right-hand side when you have turned round the temple of Radha. It used to be the house of Purtab Guman, but Jetra lives there now with his mother and his brother and sister. Go that way and you will find it.'

VIII.

The convict rose in bewilderment, and turned, as if mazed, in the direction he was told to go. He had already reached the temple before the things he had heard began to shape themselves more or less clearly to his reflection.

His son was now grown up and married—that was the first hard fact he had to grasp. He had thought of him mainly as of a puling infant at his mother's breast. At times, as he pondered in his island prison, he had understood that his son must be growing into a talking child, a lusty boy, a cheerful youth—unless, of course, he were dead; but he never thought of him as dead. Yet this understanding had never really

touched him or displaced the remembered picture. Here he had a something that was altogether new; and he felt with a sort of awe that he would not recognise his child, and that the boy could not know his father.

And then there was the fact about the house. Why should they have moved to another house, and—he remembered the street well enough—a larger and a better house? A widow and an infant left alone—they could not have saved money; it was enough, and more than enough, that they had not famished. He had feared for them, dependent upon the charity of villagers, kinsmen—kindly enough, he felt sure, for he knew the custom—but, after all, the sparing charity of poor men. But now he found them in a fine, large house. What could it mean?

Then with a rush the last fact gripped him and overwhelmed the others with its wonderment and its pain. Jetra had 'a brother and a sister.' But he had left his young wife, the pretty smiling girl whom he had loved so much and who had lain so softly upon his arm, whose every touch had been an endearment, her every smile a caress—he had left her with her first-born only three months old in her arms. Had she forgotten him? Had she been unable to resist? Given herself to another? Borne another man's children?

He thrust the thought from his mind at once. His pretty girl, his sweet young wife—she must be waiting for him still. He had come back to her now; he had need of her.

PARROT STORIES.

By ELLA MACMAHON.

'PARROT; good talker!'

Speech is one of man's greatest gifts. Without it interchange of thought and ideas might not be impossible, but it would certainly be hampered. The power of speech makes all the difference between the companionship of man and man, and of man and the lower animals. Nevertheless, the dog has been called the friend of man, but no one has ever described the parrot as such; yet the dog is dumb, and the parrot talks. The table-talk of parrots would fill a volume—indeed, many volumes; but it does not need a volume to prove that, although the parrot has achieved speech, he cannot lay claim to the noble name of friend. 'Good talker!' The phrase is paradoxical; but is not the parrot himself a paradox? Still, he has companionable qualities.

As entertaining companions, parrots are easily first among the lower creation, monkeys not excepted. To explain precisely how this is, is not easy; but it may be that it arises from the combination of an almost uncanny perspicacity with a mordant and ironic humour, to which the element of complete unexpectedness puts the crowning touch. Moreover, parrots say what, as a rule, human beings only think.

For example, a lady was showing off a parrot to a guest. 'He is a very clever bird,' she said enthusiastically, 'and talks beautifully.'

'You're a liar,' said the parrot.

Again, some people had a parrot; they also had a butler. The butler developed a great affection for the parrot. The latter was taken ill one day, and continued to be sickly for some time. The butler, much distressed, begged to be allowed to take the beloved bird down to the housekeeper's room, where he could nurse him the better. He got leave to do so. In due course the patient recovered, and was restored to his usual place

upstairs. After his return his favourite remark to his owners was, 'Let the devils ring again.'

Another parrot, owned by a family whose house was situated close to a cab-stand, indulged his love of mimicry and malice in whistling piercingly for a cab, so that the occupants of the neighbouring houses were daily subjected to the spectacle of a burly and blasphemous cabby dancing with impotent fury on the doorstep, while on his perch in the window the parrot rocked to and fro in ecstatic shrieks of mocking laughter.

But if malice and mockery are characteristic of the parrot's talk, appositeness is assuredly also. So marked is the latter that it is often hard to believe that the bird can have no real apprehension of the meaning of the words it utters, or of those uttered by human beings.

A parrot known to the writer, and belonging to a famous astronomer, was being taught to say 'Jupiter and Venus,' but he would persist in saying 'Jupiter and Lady——,' naming the wife of his owner! This bird's powers of mimicry were abundant, and a favourite pastime of his was to call the dogs in the voices and accents of their respective owners. When the misguided animals came racing in response from the uttermost parts of the house, eagerly hoping to be taken for a walk, the parrot would laugh jeeringly at their discomfiture. So perfect was his mimicry that the dogs were invariably deceived by it.

Another parrot among those of the present writer's acquaintance exemplifies the same qualities in the following incident. The owner of this bird was busy in her garden one day, when she espied the wife of a local magnate advancing with stately step up the drive, intent upon paying a call. The lady of the house, who was bored by the interruption, and had no particular desire to see the approaching visitor, darted indoors and gave the order, 'Not at home.'

She then returned to the garden, and from behind a screen of bushes overheard the following.

'Is Mrs B. at home?'

'Not at home, madam.'

A third voice, rudely and loudly, '*Rats!*'

The parrot had been brought out on to the doorstep to enjoy the air and the sunshine, and his presence on the scene had been overlooked.

The aptness of the ensuing illustration almost beggars belief. A man made a bet with a friend that he would teach the latter's parrot to say the word 'hullo' in one lesson. Accordingly he sat down beside the bird's cage and repeated the word 'hullo,' 'hullo,' 'hullo,' without pausing, for nearly ten minutes, the parrot meantime remaining apparently quite unheeding, and so motionless as to suggest sleep—altogether a singularly unpromising pupil. Nothing daunted, the teacher, after a brief pause to take breath, began once more, 'Hullo, hullo.' Rousing himself with ostentatious effort, Polly fixed his instructor with a cold and glittering eye, and exclaimed, 'Number engaged.'

A doctor was asked during a professional visit how long he thought the patient might live. On his replying to the question, his pronouncement was crushingly capped by a parrot in the house, 'You know nothing whatever about it.'

Readers of Mary Wilkins's New England stories may remember one in which the heroine's parrot puts the finishing touch, and at the same time displays appositeness and malice in ready combination. The story is that of a school-teacher in a remote village, alone in the world and past her first youth, whose dreary life is suddenly transfigured by the belief that the new and attractive minister has fallen in love with her—owing to circumstances a pardonable assumption. But all too soon she is snatched out of her fool's paradise. The close, a pathetic little scene, shows her utterly broken down, sobbing her heart out in cruel disillusion, while

her parrot screams with gleeful candour, 'That was a damned cracker, Maria.'

But for malice aforethought of studied and almost Teutonic devilry the following episode could hardly be beaten. Some friends of the writer possessed a parrot of whom they were very fond. They had had her from the time she was quite a young bird, and had taught her to speak, and to speak very nicely. She was gentle and good-tempered, but rather shy, and invariably relapsed into silence in the presence of strangers and visitors. On a certain summer day her owners gave a garden-party. The day was gorgeously fine, and a large assemblage responded to the invitation. Tea was in the dining-room, where in one of the widely open windows overlooking the lawn Polly's cage stood. Almost every person who came in to tea greeted the bird and tried to elicit a word from her. No use; she remained immovably silent, and regarded one and all with an expression inscrutable and remote. Late in the afternoon, when the guests were all out on the lawn, the hostess was brought word that the rector of the parish had arrived, and was in the drawing-room. Hurrying into the house, the hostess welcomed her spiritual pastor, and led him to the tea-room, empty now save for the parrot. The rector was a dignitary of the Victorian era, pious, pompous, and severely proper in word and deportment, likewise somewhat difficult to talk to. Hospitably intent, the hostess ploughed her way laboriously through such consecrated items of small-talk as she hoped might be acceptable to his reverend sensibilities. Despite her efforts, however, the flow of chat was sluggish, and all too soon came the fatal pause and embarrassing silence. She was suddenly and awfully delivered out of this conversational impasse by a loud voice which exclaimed confidentially in uncouth but cheerful accents, 'It's ruddy warm to-day!'

THE PARTS MEN PLAY.

CHAPTER VII.—THE CAFÉ ROUGE.

I.

MONSIEUR ANTON BEAUCHAMP was the proprietor of the Café Rouge in London. Monsieur Anton Beauchamp was once proprietor of the Café Bleu in Paris.

For many years he had cast envious eyes on London. Did not always his guests, those strange blonde people with the clothes like blankets, pay his prices without question? Did they not drink bad wine and never add the bill? *Pardi!* If he could have only English as patrons, madame and himself could purchase that wine-shop in the Boul' Mich', and never worry again.

For years the thought of London haunted Anton, and then one day, in a superb moment of decision, he announced his intention of journeying thither. A large entourage followed him to the Gare du Nord, and, with much the same feelings as those of an explorer leaving for the North Pole, he bade a dramatic farewell, and almost missed his train by running back to give a final embrace to Madame Beauchamp.

With no undue mishap he reached London the same night, and next day he lunched at a famous London restaurant. At night he dined at a fashionable establishment in Shaftesbury Avenue. In both places he received ordinary food served without distinction, reckoned up

the bill, and found that in each case *l'addition* was correct—and rushed madly back to Paris, where he sold the Café Bleu, packed up his belongings, and explained matters to his wife, doing all three things simultaneously.

'The dinner,' he exclaimed in a fever of excitement, 'is served—so! As a funeral. I order what I like, and the waiter he stands there *comme un gendarme*, as if it is my name I give. "Any vegetables?" demands he. *Mon Dieu!* As if vegetables they are no more to him than so much—so much umbrellas. I say, "*Garçon, la carte des vins!*" and, quite correct, he hands it me with so many wines he has not got, just as in Paris, but—*que penses-tu?*—he permits me to order what wine I choose, so—by myself. *C'est terrible!* I give him three pennies and say, "*Garçon, for such stupidity you should pay the whole bill.*"'

Monsieur Beauchamp was a man of shrewdness. He knew he could not compete with the established solidity of the Trocadero, the Ritz, the Piccadilly, or the garishness of Frascati's, so he purchased and remodelled an unobtrusive building in an unobtrusive street between Shaftesbury Avenue and Oxford Street, but clear of Soho and its adherents. He decorated the place in a rich red, and arranged some *cabinets particuliers* upstairs, where, by the screening of a curtain, Madame the Wife and Monsieur the Lover could dine without molestation of vulgar eyes.

Monsieur Beauchamp felt himself a benefactor, a missionary. He argued that the only reason Londoners were not as flirtatious as Parisians was lack of opportunity. He, the proprietor of the Café Rouge, would bring light to the inhabitants of the foggy city. To assist in this philanthropic work he brought with him an excellent cook, who had killed a dyspeptic Cabinet Minister by tempting him with dishes intended only for robust digestions, and three young and ambitious waiters; while madame engaged what unskilled labour was required.

Unobtrusively they opened for business, for he knew that publicity would spoil his chance of success. (Once convince a Londoner that he is one of a select few who know a restaurant, and he will stand an hour waiting for a table.) The first customer to enter received such attention that he brought his family the next night. Monsieur Beauchamp issued orders that he should be snubbed. *Parbleu!* was the Café Rouge for families?

Gradually the justification of Monsieur Beauchamp's policy became evident. Ladies of the Chorus brought their admirers there, and to the former Monsieur Beauchamp paid particular courtesy. Long study of feminine psychology had taught him that, whereas a woman may change her lover, she will not change her favourite café. Therefore, though the man may pay the bill, the woman is the one to please. Artists from Chelsea would come as well to the Café Rouge, celebrating the sale of a picture,

and drinking plentifully to the confounding of all art critics. Also, the *cabinets particuliers* were the scene of some exceedingly expensive and recherché dinners—and almost no one added the bill. When any one did, Monsieur Beauchamp was mortified, and invariably dismissed the same waiter on the spot—thereby gaining for himself and France a reputation for sterling integrity.

'*Ma foi!* London may be gray,' thought Monsieur Beauchamp, 'but she pays well.'

II.

One November evening Monsieur Anton Beauchamp's critical eye noted the entrance of a dark-haired young man in well-fitting evening clothes, and with him a young lady whose deep-green cloak and white fur round the shoulders set off to perfection her radiant colouring and well-poised figure. Monsieur Beauchamp did not hesitate. After all, he was an artist, and subject to inspiration like other men of genius; so, hurrying downstairs, he waved the waiter aside, and greeted them with a bow which almost amounted to virtuosity.

'*Bon soir, monsieur et madame.*' He cast an anxious glance about the café, which was two-thirds filled. 'This tabil will do!—*Ah, mais non!*' He grew indignant at the very thought. '*Pardon, monsieur*, that one is very nice—*par ici.*—*Non, non!* *Ah*—perhaps you would like a *cabinet particulier?*'

The siren tone of voice and the gesture of his hands indicated the seraphic pleasure to be obtained only in one of those secluded spots.

The American turned inquiringly to the girl.

'When I was here before,' she said, 'I was at a table just upstairs to the right. Have you one there, Monsieur Beauchamp?'

Nom d'une pipe! She knew him. And she was beautiful, this English lady. As he personally escorted them upstairs, with the importance of a Lord Chamberlain at a Court function, Monsieur Beauchamp speculated on the flirtatious potentialities of the young woman. If she were only clever enough to be fickle, what a source of profit she might be to the Café Rouge! And was she not in appearance much like Mademoiselle Valérie, for whom a member of the Chamber of Deputies had blown out the brains of Monsieur P—— de l'Académie Française?

With the assistance of a waiter, he ushered them to a table almost hidden by a pillar, where a crimson-shaded light sent a soft glow that was guaranteed to make the most of a woman's eyes. Monsieur Beauchamp with his own hands brought them the menu card, while the waiter stood expectantly, crouched for an immediate start as soon as he received the signal. A small waitress appeared with the butter and rolls, and made her way underneath the arms of the proprietor and the waiter like a tug running round two ocean liners. Monsieur Beauchamp could recommend

the *Barquettes Norvégienne*—No? Madame did not so desire? Of course not. He frowned terrifically at the waiter, who glared ferociously at the diminutive waitress. *Morbleu!* What imbecile suggested *Barquettes Norvégienne*? Monsieur Beauchamp mentioned other dishes as an overture to the meal, waxing increasingly wrathful towards the waiter on each veto. Ah! Monsieur desired *Consommé Anton*. The proprietor's face beamed and his arms were outstretched towards heaven. That this gentleman should order *Consommé Anton*, the soup of which he alone knew the secret, and which had been named after himself! Truly, the life of a restaurateur was not without compensations. He turned on the waiter—but that worthy had darted away to execute the order.

III.

The soup appeared. Monsieur Beauchamp stood by with the attitude of an artist watching the hanging of his first painting in the Academy.

'You might let me see the wine list,' said Selwyn.

Monsieur Beauchamp struck an attitude of horror. Had it come to this in the Café Rouge, that a patron must *ask* for the wine list? Brandishing his arms, he rushed from the table, almost colliding with the little waitress, flew downstairs to the very farthest table near the door, seized a wine card, and puffing generously, arrived with the trophy at the table, much as Rothschild's messenger must have reached London with the news that the British were winning at Waterloo. Having then succeeded in making the American order a red wine when he wanted white, Monsieur Beauchamp withdrew in a state of histrionic self-satisfaction.

With a smile of relief Selwyn looked across

the table at the girl. Even in the soft glow of the lamp, which made for flattery, it seemed to him that the vivacity of the morning had disappeared, and in its place was the petulance of the previous evening. Her eyes, which seemed when they were riding to have caught something of the alchemy of the skies, were steady and lighter in shade. Again he noticed the suggestion of discontent about the mouth, and the upper lip looked thin and lacking in colour.

'It is your turn to-night to be pensive,' she said.

'I was thinking,' he answered, 'that it is hardly twenty-four hours since we met, and yet I have as many impressions of you as an ordinary woman would give in six months. For instance, last night when you entered the room'—

'But, Mr Selwyn, any girl knows enough to arrive late when there is no woman within twenty years of her age in the room. The effect is certain.'

There was no humour in her voice, but just a tone of weary, world-wise knowledge. A look of displeasure clouded his face.

'Surely,' he said, 'with your qualities and appearance, you don't need such an elaborate technique.'

'In a world where there is so little that is genuine, why should I debar myself from the pleasure of being a humbug?'

'Come, come,' he said, smiling, 'you are not going to join the ranks of England's detractors?'

She shrugged her shoulders. 'I'm certainly not going to become a professional critic like Stackton Dunclekey, who hasn't even the excuse that he's an Irishman; or Lucia Carlotti, who hardly ever leaves London because her dinners cost her nothing. But I reserve the right of personal resentment.'

(Continued on page 115.)

'A TOWN BORN LUCKY.'

SUCH was Rudyard Kipling's apt comment concerning Medicine Hat, Alberta—the city with the curious name which the Prince of Wales, during his recent tour of Canada, found of such unique and compelling interest. In these days of coal rationing, a city which, although situated almost directly above a vast bed of coal, yet burns none, even in the coldest winter, certainly appeals to one's interest and curiosity. The reason for this seeming anomaly is that Medicine Hat, in addition to coal, possesses an apparently unlimited supply of natural gas, which alone is used for heating and cooking. For lighting, there is the choice of either gas or electric light, electricity being generated at a central power-station by means of the gas, and distributed throughout the city. The entire cost of cooking, heating, and lighting, in the case of a private house of medium size, is between

£5 and £10 per annum. The coal meanwhile is held in reserve against the day when the supply of natural gas becomes exhausted.

The city's vast natural gasometer is found at a depth of somewhat over 1000 feet below the surface, and gas is obtained by the simple process of drilling to tap the supply. Numerous gas 'wells' bored at strategic points satisfy all industrial, domestic, and municipal requirements. The daily consumption is in the neighbourhood of 3,000,000 cubic feet, but the great natural pressure of between 500 and 600 pounds per square inch shows no sign of falling off in spite of this consumption. The natural gas consists almost solely of methane, and its heating-power is some 50 per cent. greater than that of ordinary coal-gas. It is sold for domestic purposes at a trifle over sixpence per thousand cubic feet (think of it, ye British householders!),

and to manufacturers at from one-halfpenny to twopence halfpenny per thousand cubic feet. For use in gas-engines the charge is a halfpenny per thousand cubic feet, the power produced costing the manufacturer about eight shillings and sixpence per horse-power per year. This is, without exception, the cheapest power in the world. By way of comparison, it may be remarked that the mammoth plants operated by the Niagara Falls cannot supply power to the largest consumer for less than about thirty-eight shillings per horse-power per year, or nearly five times the cost at Medicine Hat.

Competent experts have stated that in their opinion the flow of natural gas will outlast the present century. Whether this estimate proves to be correct or not, the future of the city's manufacturing industries is rendered secure owing to the presence of a coal-mine within half a mile of the town which has an estimated content of 77,000,000 tons of coal. The owners of this coal are under contract to deliver coal to manufacturers at a cost of approximately six shillings per ton. This is what the citizens term 'natural gas insurance.' For the double purpose of supplying electric energy and of filtering and pumping water from the South Saskatchewan River, which flows through the city, Medicine Hat has constructed, at a cost of some £100,000, a power plant which is not only unique, but strictly up-to-the-minute. It is a sort of 'stokers' paradise.' Boilers there are in plenty, but no coal or ashes. Natural gas is burned in giant Bunsen-burners under the boilers for the generation of steam to operate Parsons steam-turbines, which in their turn drive dynamos for the production of electric energy. This is supplied to manufacturers at from one-halfpenny to twopence halfpenny per kilowatt hour.

With such solid backing in the way of natural resources, it is not to be wondered at that the growth of Medicine Hat has been extremely rapid. When the writer first visited it twenty years ago, the inhabitants were mainly Indians. Since then the tepee of the Indian has given

place to the imposing stone and brick blocks of a thriving western city. The British manufacturer would be well advised to investigate the inducements which this unique city holds out. Situated on the main line of the Canadian Pacific Railway, at the point of junction with the Crow's Nest Branch, it is approximately midway between Winnipeg and Vancouver, and obviously affords transportation facilities of the best. Its power is the cheapest in the world; the supply of good water from the South Saskatchewan River is unlimited; its position in the centre of a vast area of prairie land affords room for endless expansion. Surely these form a tempting combination. At any rate, the American manufacturer has thought so. He is not slow to grasp opportunities, and has been established in Medicine Hat for some years. Apart altogether from the general needs of Canada for manufactured articles of every description, there is reason to believe that a great market will shortly open up close to the very doors of Medicine Hat. A short distance west of the city lie the huge tracts of irrigated land owned by the Canadian Pacific Railway Company and the Southern Alberta Land Company, and admirably adapted for mixed farming. The area owned by the former company consists of over a million acres; that owned by the latter company amounts to some 400,000 acres. The irrigation of these tracts has involved an outlay of millions of dollars, and settlement upon them should be rapid now that the war is a thing of the past, and should furnish a great market for farming implements.

It has been said that everything is unique about Medicine Hat, even its name! The origin of the term is somewhat obscure, but, according to one legend, this locality was the scene of a fierce battle between two Indian tribes, during which the 'medicine man' of one tribe fell into the river. Many braves lost their lives in an attempt to rescue his hat—an object of great veneration, apparently. Hence arose, it is said, the name of the city.

MR PHIPPS OF 'THE OLD FIRM.'

PART III.

I.

FOR a quarter of an hour Ruth rested by me in the same posture, speaking not much, yet her very breathing telling of happiness and tender compassion. And such was my own happiness that no shadow fell on it from what I could not but heed—namely, that a great pain was growing between my chest and back, and the room was misty, with now and again faces of those I knew floating about it—the king's, Middleton's, Melfort's. 'The whole Court of St Germain soon,' I said aloud.

Ruth started up; her hand, feeling cold as ice, touched my forehead. She slipped from me, standing very frightened.

'Dick, you are so fevered! Why do not the surgeons come? What can I do? Shall I send for Mr Orlebars?'

Whereupon my brain cleared like magic, and an intense dismay seized me as I thought on my helpless state, and on what, helpless or not, I had to do—which affair I had in my recent ecstasy quite forgot. I essayed again, and desperately, to rise, but the agony beat me at once.

'Ruth,' I said, 'I must get to horse for an

hour. I will come back—I promised Orlebars—but I must get to horse. You will lend me one? Dear, lift me.'

She took my hand, smiling, yet her tears like to show afresh. 'You are all fevered, sweetheart. You know you cannot sit a horse, nor do you want to. You will lie still and let me have care of you'—

'A horse,' I said, 'and a servant—a trusty man to hold me in the saddle. Was my coat brought in? Dearest, have you a servant that will be true to me for your sake?'

'Nay, rest you, my love,' she answered, fondling my hand in entreaty; and from her woeful, terrified look I saw she thought my mind wandering.

'Ruth,' I said, and clasped one of her slender wrists reassuringly, 'listen. My old pate is clear as clear, but there is something I must do at once if I would keep it safe, and the heads of others safe. They discovered no letters on me, but that was because I hid a pack in the hedge—a mighty dangerous pack'—

'Ah-h! you beat them,' she exclaimed, with relief at my sensible condition, and with also a lurking note of admiration in her voice. 'You heard them in time!'

'Ay, I heard them,' said I, very determined to let it go at that; 'but they will find the packet when they search in daylight; they will see the fresh-dug soil. I must fetch it now, and I must get to the sloop from France to send it across, and to warn three of my friends that will land from her and go to London that certain houses are like to be watched now I am caught. So you see, my heart, I dare not tarry; and I must have your aid, if you will be so merciful to my friends and me. Lift me, dear one; lift me.'

'No, no, no,' she answered, moving her head sorrowfully, and softly stroking my brow. 'How were it possible? Oh, Dick, they have broke your leg, and you are hurt a dozen ways. You know you cannot stir, and would die on a horse did one set you there.'

'Lift,' I pleaded.

She gave a quick sign, and began to pass her hands under me; and presently, having raised me a trifle, so that my face was against her dear breast, she paused and kissed my head. And then she raised me a trifle more, whereat I gasped and gurgled, and protested not as she laid me back.

'Mr Phipps! Mr Phipps!' I muttered. I gazed in misery at her. 'Ruth, Mr Phipps is spun—discredited—clean doomed!'

I stiffened my jaw, and pictured what a rare to-do there was going to be, ending with the scaffold for some of the smaller men I had netted, and, I half-expected, for myself, as a noteworthy example. Well, I wished it so, if the little fellows were to suffer through me. At any rate, I should have my Ruth for a few days here at Shepherdsholme.

II.

A mist was now between her and me, and faces were appearing and drifting and vanishing, but this time queer and horrid ones more like to masks than human features, save that there was old Sir Jacob with his rich-coloured kerchief. . . . I felt a cup at my mouth, and drank deep, and soon I saw Ruth distinctly and the chamber bright lit once more.

'I have Colbran,' she was saying; 'he that was my grandfather's horse-jockey and is the faithfulest old man that can be. He shall go for your letters, and—and'— She paused, and, the drained cup in her hand, made that same gesture which she had made when just come to the room—that gesture of abandoning—but smiling down on me now, though a shade wistfully. 'And he shall deliver them to the ship, if that must be, and do all your bidding.'

'My sweet, generous heart!' I said, and for a while could speak no word more, what with thinking how much it must cost her to place herself thus against her party, and with rallying my wits to examine the hope which her offer awaked in me.

It was no empty hope. A faithful man might well do all that I had purposed. If he were brave and crafty to boot, the odds were really in favour of his succeeding.

I caught Ruth's hand that bore the cup. 'Yes, yes,' I said, 'lend me your Colbran. Dear, you are giving men their lives to-night. Bring Colbran quickly to speak with me.' Then, as she would have sped away, I held her. 'It will be a perilous errand,' I said. 'There may be fellows even now searching in the lane where the letters are, and others seeking the sloop. Is Colbran more than faithful? Is he subtle, stout-hearted? The sort to fool a questioner, to risk a pistol-ball? I shall be easier for knowing that.'

'I can trust no other man in this,' she answered. 'Indeed he is very worthy of trust—but'— The fingers of her free hand stole to the back of mine and there played softly. Her face grew thoughtful, troubled. 'But he is old and maybe something failed in spirit—and he is not cunning. Ah me, I wish'—

'Nay, dear, I am most content,' said I.

'But not I.' She gently took my hand from her and laid away the cup, doing this simple thing with pensiveness. And then she looked up, her lips apart with excitement, and her eyes shining. 'I myself will go. I will have a pillion-saddle behind Colbran.'

'Never!' I cried vehemently. 'You shall not be mixed up with this.'

With a smile, and with a sign of the hand that she would not listen to me, she threw back the lid of one of her chests, and brought therefrom a long brown cloak having a hood.

'For thee I will be mixed with it,' she said.

'Not for me; not for the king; no! not for

any one,' I answered. Forgetful, I tried to start up, then lay groaning from the attempt, she coming and soothing me wonderfully. 'Hark you, my life,' I said, gazing up at her. 'I tell you there may be searchings and spyings outside; and nowadays the country is pretty mad against us, and the men that winged me to-night are madder than the rest, deeming I cheated them of the letters. They might question you roughly, touch you roughly—damn them! might even fire on you if you stopped not when bidden, despite that Orlebars has threatened their necks for shooting me. . . . If you were killed for me!' That thought was past bearing. 'Ruth!' I shrieked. 'Ruth! hold me. Make me feel you are alive! I believe they have slain you!'

'Sweetheart, you are so ill and distraught,' said she with utter pity when she had calmed me. 'There is nought to fear. I shall stop if called on. Wherefore not, pray? I shall be but going to a surgeon—to several surgeons, if need be, going myself to beseech them haste to you with all speed.'

'Mistress Phipps!' I said, and was aware of my lips wavering into a smile. 'But you shall not go, Mistress Phipps.'

'Yes, and quickly,' replied she, 'lest the surgeons come ere I leave, and so my excuse be the weaker.—Tell me, Dick, I may go.'

I rocked my head in refusal; but, as she had said, I was ill, and my mental strength was running almost as low as my bodily. I fought against her will, but in a minute or two she had me conquered. Whereat she kissed me with a little pretence of glee, and stood back to put her cloak about her shoulders.

'Where are the letters?'

'In a leathern wallet that is in the fork of two big roots of the "Gospel Oak." The two greatest roots, I should say. It is under an inch of earth.'

'I must take it—whither?'

'Know you a patch of beach named "Thane's Strand"?'

'Why, verily! And a swift road to it.'

'A sloop will be off there at nine and wait for me until midnight, her rowboat within hail of the shore'—Something came to me, giving me such consternation that for the first time I realised how intense my hope had been that the matter would be finished satisfactorily. 'Dear!' I cried, 'what hour is it?'

And as she went to a table that was glittering with her scent-phials and nick-nacks, amid which, I guessed, her time-keeper lay, I had a conviction that many hours were passed since I was waylaid.

'A quarter after ten,' said she, and took some toy from amongst the others, which she held to her throat on returning to my side. It was the string of rubies that had been in my pocket. Seeing my eyes on them, she kissed them very simply. 'I will wear them so soon as I am returned,' she said. She leaned across me, and opening a panel at the head of the bed, secreted them behind it.

'Do not go,' I urged, stretching my hand to her. 'I shall lose my reason of fear for you when you are gone. Nay, I cannot endure you to go!'

'I shall be here again under two hours, dear one—and all made safe.'

I felt tears rolling along my cheeks. 'I could not face those two hours,' I muttered.

'Except they meant lives, honour—so much!' said she softly. 'Did not they mean all that to you, I could not face them, turning my coat so. But I deem I must.—The boat will be within cry?'

'Always, unless the sea is become very rough. Then it would pull landward each hour, close on eleven, close on twelve—twelve'—a drowsy faintness commenced to steal over me—'twelve,' I said again, and added ramblingly (Ruth has told me since), 'The sloop is used to waiting for me, who was a wretch to keep her long in dangerous waters. But I *had* to see Ruth!'

My eyes were shut by now. Though I heard Ruth murmur endearments, I was fast slipping beyond sound of her voice, when an appealing question from her rallied me.

'When I am come to the beach—what then? What then, Dick?'

For some instants I regarded her silently, ordering my thoughts, which, after a painful effort to begin with, I did satisfactorily. 'Look seaward,' I said, 'and cry as loud as you can, "No more fishing to-night!" Whereat some one will ask, "How many?" and you shall say—and you were better write these to remember—"six—three—nine—two."'

"No more fishing to-night;" "six—three—nine—two," she repeated, and then nodded.

'At that they should put in. But if they hang at sea, not able to account for your voice, or for Colbran's, did he call, say at once that you are from Mr Phipps, and that will bring them.'

'And to what man shall I give the letters?'

'Ask for Mr Walters or Mr Athorpe; and say also that the "Two Keys" by Temple Bar, and Mr Tarron's house by Moorfields—ay, and the Cat and Broom Inn at Southwark—are now certainly watched.'

She went swiftly to her table, and sweeping aside some of her trinkets, began to write, saying the words aloud that I might correct her.

'If young Peter Middleton—Middleton's mad-headed cousin—be in the boat,' I said when she was finished, 'he will wish to organise a dash to rescue me. Straitly forbid him. It would be a fatal sally—and my word is pledged to Orlebars.'

I saw her eyes become like stars. 'A litter!' she said. 'They could bear you to the beach on a litter.'

'Nay, my heart, I yield not in this,' I answered. 'Promise to forbid young Peter.' And, though with reluctance, she affirmed that she would.

And then, crossing to me and kissing my lips, and afterwards kissing my eyelids and saying

that thus she would make me doze until the surgeons came—feigning the while to be light-hearted, yet at the last her voice caught with little sobs—she bade me good-bye and passed in haste from the chamber.

III.

For a time I strained my ears to detect the hoof-beats of her horse. I heard nothing, however; and presently I lay thinking of little save the pain between my breast and back, which was much severer, and my breathing, which was hard to accomplish and would not satisfy my lungs. Then followed a period of more ease, wherein I was taken with wonder, as well I might be, at the way events had gone. In fear of Ruth I had buried my letters, and so saved them from those whom, in my self-conceit, I felt no fear of. Two hours ago I should have held myself demented to allow her to lay but a finger on the wallet; now she was warden of my letters and my friends, and I had made her this with no remembrance of my many years' mistrust, with no hesitation except as touching her safety.

I imagined her out on the night-road, old Colbran the only man to guard her, and my enemies lurking thick around. I set my hand over my eyes and prayed long that she might come through unharmed. Then, a deal happier, I sank into a sort of languor, believing that soon I should doze as Ruth had said.

But instead, my pain started afresh and my head throbbed, and after a space the walls of the room seemed to puff in and out like tapestries blown by the wind, and the old mistiness was about me. I half-realised that one of Ruth's women was come into the room, asking if I

required aught, and that shortly there entered another, saying that a surgeon was passed in at the gates; but I scarce heeded them, for they were less actual to me than the faces which were drifting before me again—both St Germain and barbaric faces now.

These began to shout upon me that I was a fool beyond matching; that Ruth had wheedled me, and was gone to betray me.

I moaned at the hideousness of what she had done to me. But then I recalled her eyes, dark blue and bidding me read her soul; and in a mighty rage against the lying faces I struck and struck at them. I found my arm held by a man, and I was not so delirious but I guessed he was the surgeon; and straightway a dread seized me that I might rave of Ruth's errand in his hearing.

I was endeavouring to master myself, when a pang in my knee drove all consciousness from me. Thereafter I remember nothing—save a vague discovery that some angel beloved by me, with the fresh waft of the outer night clinging to her, was close to my pillow—nothing, until I awoke as from a great sleep, and, seeing daylight, and my Ruth sitting by me, whispered (my voice having no power) that verily I thanked God she was got back safely last night.

Whereupon, starting up with a soft, exceeding joyful cry, she looked at me as if hardly able to believe I had spoken; and then, whispering also, she said that the letters were safe, that she had brought them without mishap to Mr Athorpe at 'Thane's Strand,' but I must neither talk nor listen to her more until she fetched a surgeon, who was even now below-stairs—for two whole weeks were gone by since the night she did this.

(Continued on page 113.)

VELOCITIES.

By H. J. MARTYN.

LIGHT and electricity, which move at the rate of from 186,000 to 190,000 miles per second, have no rival in any velocity known to us; and since experiments have shown that light is probably itself an electrical phenomenon, they can scarcely be regarded as rivalling each other.

Our earth in its revolution around the sun does something like eighteen miles every second of time; whilst the whole solar system, in its race to some such goal in space as the star Vega, according to Herschel does eleven miles in a second, and according to later authorities from twelve to fifteen.

The sun has his own movements, and the so-called spots which he indicates have been resolved into up-rushes and down-rushes, with movements amounting to 320 miles a second.

There are stars which are said to race around their orbits at the rate of 400 miles in a second. Arcturus, which we can see so clearly, is declared

to get over 300 miles in a second, and Groombridge (1830) 200 miles in the same brief period of time.

Halley's comet approached our earth, in the August of 1909, at the rate of 500 miles a minute, being accelerated to 2000 miles a minute and more as it increasingly felt the attractive force of the sun. A meteor seen by Mr W. E. Besley from Clapham Common came to our earth at a speed of twenty-two and a half miles per second.

Earthquakes can certainly travel at the rate of 150 miles a minute, this being the registered time guaranteed by Professor Milne for the earthquake announced on 26th July 1908 in the daily press.

The progress of glaciers, even under favouring circumstances, is not more than thirty-five feet in a day or about three miles in a year.

Sound passing through air at the freezing-

point of water reaches 1089·42 feet per second, and increases 2 feet per second with every rise of 1° C. in temperature. Its speed through water is more than four times as great.

Waves of ocean in a full gale scarcely get beyond thirty-five or forty miles an hour, whilst the waves used by Marconi are the waves of light, heat, and electricity, which go beyond 186,000 miles a second.

The wind is strong when it dashes forward at a speed of from twenty-four to thirty-seven miles an hour; from thirty-seven to fifty-five miles in the hour it creates a gale, and from thence to seventy-five miles a hurricane. When the Tay Bridge was destroyed in December 1879, 100 miles an hour was registered. During Mawson's Antarctic Expedition the wind was occasionally found to exceed 200 miles an hour.

Man's walking cannot get much beyond six miles an hour, which, however, was what Joseph Calib of Dumbarton achieved, without a break, in the distance between Dumbarton and Glasgow on 2nd January 1820. Man's running can take him a mile in less than five minutes, and scarcely more than fourteen miles an hour. A race-horse can reach thirty-two miles in that time, and appears to greatest advantage in such short distances as the Derby, which Lemberg won in 1910 in two minutes and thirty-five and one-fifth seconds.

The gray wolf does twenty miles an hour easily, and the fox when hunted has run two miles at a speed of twenty-six miles an hour.

Professor Spallanzani gives the maximum flight of the swallow at 290 feet per second. In Berlin, Professor Voss found the maximum speed of pigeons 100 feet per second. The flying trials organised by the *Petit Journal* gave the highest speed they attained as sixty-eight feet per second. The swallow has champions who claim that their bird has done 129 miles in an hour.

We have all seen with what rapidity fish can dart in pool and river, and the shark has an evil reputation in his haste to overtake anything whereon he scents the dying or the dead. Predatory fishes can, indeed, reach the speed of a torpedo-boat, and porpoises have been seen at play whilst keeping pace with a steamer running at fourteen knots.

In railway speed the Lake Shore Flyer did 100 miles an hour; the Twentieth Century Express from New York to Chicago covered 481 miles in 460 minutes. The Great Western has done from Paddington to Plymouth, which is 246 miles, in 275 minutes. Our railways have, however, never maintained their utmost speed, the Government having rightly given warning checks to the racing propensity.

Motors meanwhile have entered the race. In May of 1906 the police told the Chesterfield magistrates that the car they challenged was 'flying' at the rate of three miles a minute. In 1909 a car driven by Mr Nazzaro ran 120 miles an hour. Greater speed has since been obtained.

We are not likely to forget that the *Mauretania* and the *Lusitania* crossed the Atlantic in less than five days, and made such records the standard time for the future. A far more wonderful record has been made—an aeroplane has flown over the broad Atlantic, and has been followed by the R 34, which flew to America in 108 hours, and came back to us over a distance of 3000 miles in two days and fifteen hours, being an average of fifty miles an hour.

Man, who is the centre and source of these marvels, carries about with him some interesting velocities. The blood propelled by the human heart travels in him at the rate of seven miles an hour. The nerve-wave, without which he could have neither sensation nor perception, reaches in him about 200 feet per second, an estimate which Draper considers too low. Waves of light reach his eye at from 450 to 750 million millions per second, whilst the Cathode rays are ceaselessly assailing him and everything in space at a speed of from 50 to 100,000 miles in a second; some of them, indeed, reach half the speed of light. Man has but to fire his rifle for the bullet to fly at the rate of a few thousand feet in a second. Experiments demonstrate to him that the molecule of hydrogen has a velocity of over a mile in the second, and that in a mass of hydrogen each particle is moving at the rate of seventy miles in a minute.

Gas atoms move at the rate of seven miles in one second, and electrons at the rate of 10,000 miles in one second.

THE SLEUTHS OF THE SILENT CITY.

By H. MORTIMER BATTEN.

I.

FROM the burn-edge the moor swept upward to the west in a vast undulation of heather, broken here and there by deeply washed waterways and still peat pools, shining blood-red in the light of the setting sun. Far on the skyline above reared a chaos of ruined buildings, turret upon turret and buttress upon buttress, standing

out grim and desolate against the evening glow; and, for all the grandeur of the scene, there was something depressing in the sight of that dead city. A city it surely was, for the ruins dotted here and there, some large, some small, covered many miles of land, yet there was no sign of human habitation, no imprint of human feet on the roads that led to and from this place. The roads themselves had become deep watercourses,

jagged and fissured, winding between the city walls; and beneath the crumbling roofs ferns sprang, and vast entanglements of briar barred the entrances. Here and there an old oak door still swung on its hinges, whining and moaning in the breeze; while the wind howled and sobbed about the crumbling pinnacles.

Fifty years ago this place had throbbed with the sounds of the miners' pick and drill, rows of shining buckets had stood by the thresholds to sweeten, and bright-faced moorland children had gambolled about the rutty roadways; then, with the discovery of surface lead in Italy, this mine, like others all along the range, had been shut down in a single day, lost henceforth to all human interest amidst its lonely setting.

Wild nature is not slow in taking up what man abandons, and to-day, for all its silence, the deserted city of the moor was apulse with life. In the underground flues and culverts there flourished a generation of mountain-foxes, and thence, secure from man, they raided the lowland flocks with disastrous regularity. The half-wild mountain-sheep found shelter beneath the walls, while in the dripping blackness of the underground corridors the otters were able to travel at ease from the burn, and they too reared their young amidst the security of the city ruins.

II.

Night was near at hand, and now, from a chink between the great stone slabs of the washing-floor, in the very centre of the mine, there emerged a long, brown, sinuous beast that hopped in a series of hunched-up bounds into the middle of the level quadrangle. There he sat bolt-upright, apparently admiring the sunset, motionless as the ruins about him, and for all the world a part of his surroundings, save for his creamy-white front. For two minutes he remained thus, listening for some sound which would guide him in his hunting, while his shadow fell long and distorted across the flags. He could hear many sounds too high pitched for the human ear to catch—the squeaking of tiny rodents a hundred yards away, the chirping of the bats among the ruins; but suddenly there was a sound which overwhelmed all else and set the very air thundering in his ears. Yet he never stirred.

It was the noise of wings, of tens of thousands of beating wings, and for a minute or so the light was veritably blotted out as pack after pack of starlings descended, swooping and screaming, among the disordered piles. They came in vast clouds, flooding the whole city, filling the air with multitudinous sound, till the pinnacles were black with them. It was to be noticed that these birds, returning late to roost, all came from the east, so that the black silhouette of the ruins against the sunset had served to guide them hither.

The stoat or ermine sat stock-still and listened to it all; then, like the closing of a door, the

shrieks and cat-calls ceased, the beating of wings stopped suddenly; and, as the mighty feathered army disappeared with one accord into a thousand nooks and crannies, the silence of night came on.

The stoat moved and uttered a clucking sound, at which another animal exactly like himself appeared from the chink in the great stone slabs, and behind her came another and another—little fellows these, not more than five inches in length, but miniature bounding tigers, quick as their parents, and born with an inherent desire to kill.

There were six young stoats in all, the pack, with the parents, numbering eight; and now, led by their father—the first to appear—they bounded off in the direction of the furnace-house (the largest of the buildings), where the main body of the starling horde had settled to roost. Every few yards one of the adult stoats would sit up and listen, whereupon the youngsters would instantly do the same. Exactly like the dead thistle-stumps they looked, and their white fronts, far from rendering them conspicuous in the gathering gloom, broke the outline of their bodies, so that the keenest eye could never have told 'that dead thistle is a stoat.'

Several times they darted left or right, guided by some sound in the heather, and ere they had gone two hundred yards four of the youngsters were carrying something. One stumbled along with a titlark, the wings of which hampered him sorely; another dragged a huge worm as long as himself; a third struggled with a sprawling frog; and the fourth held a minute shrew. The one with the bird kept falling behind, at which his mother herded and jostled him with angry clucking sounds; and so, in due course, they reached the courtyard of the ruined furnace-house.

By this time the two remaining youngsters were carrying between them a discarded viper-skin, fighting and quarrelling as to its rightful possessor—each holding an end, so that the middle kept hitching up on pebbles and ling-tips, causing them endless annoyance; and the six would doubtless have started their night's hunting thus encumbered had not their mother interfered. She must have said to them, 'You can't hunt while you are carrying things. Come here, and I will show you what to do.'

Under a moss-covered boulder she scratched a hollow; then into the hollow she made each kit poke his or her possession, loosely raking silver sand over the spoil. There was a good deal of reluctance and ill-feeling about it, especially when it came to burying the snake-skin, but evidently their mother's assurance that 'we will come back later' served temporarily to settle matters.

III.

The stoats now set to work to hunt the ruined walls, darting hither and thither between the crumbled masonry. Every instant a head darted from a cranny, instantly to draw back, now high

up, now low down, now here, now there; and had it been daylight a watcher would never have believed that there were only eight stoats working the building. Eighty, more likely, for they were everywhere at once; and, oh, the sounds of murder that filled the night! Squark! squark! Cree! cree! Half-a-dozen starlings were dying at the same time; from every part of the building there came a scuffling and cries for help.

How many starlings the stoats killed in the course of the next hour I do not care to think—probably a barrow-load—enough to keep them in food for a month, for they were killing all the time. It may have been good training for the young stoats in the pathway of destruction, which is the stoat's lifelong pathway, but it was an infernal waste of good starling. The two old stoats struck lightning death in every nook and corner, snatching, worrying, leaving the dead birds where they lay; but the youngsters displayed a hankering, on having made a kill, to drag the victim about with them, and thus sorely hampered they would have made little progress had not their mother constantly interfered.

At the end of the hour feathers and trampled corpses were littered everywhere, and now each of the stoats snatched up the last bird he or she had killed, and out into the silvery moonlight they went. They had thoroughly satisfied their hunger, but not their desire to kill, as back they went to the cache under the mossy stone. In the mother the habit of storing away for a rainy day was highly developed, but the rainy day never came, with the result that they had bulging caches all up and down the city.

Now, arriving at the stone, they found a hedgehog in possession of it, grunting contentedly as he consumed their store, and when they burst in upon him like a pack of angry hounds he simply twitched into a ball, presenting a bayonet-point in all directions of attack. The youngsters were all in for pulling him to bits, but, having tried it, they drew back with beads of blood on their muzzles, and thereafter they would know what hedgehogs were. To besiege him was useless, for well the old stoats knew that he would remain curled up thus all night or for so long as the smell of stoat remained about, so there was nothing for it but to swallow their anger and humiliation and try to forget it all.

IV.

Through the rusty iron gates of the court the male stoat led the way, sitting bolt-upright again among the ling listening for some suggestive sound. This time it came from the rushy swamp—once a mighty dam—below, the pitter-pat of moving feet, as though a ghostly army were paddling in the mud. Away the stoats went in that direction, swiftly and silently like the hunting hounds of death, till at the edge of the swamp they again paused to listen.

On every side of them the sound was going

on—'pitter-pat-patter-pit-pat.' The small stoats raised their heads and looked this way and that, but nothing could they see. It was vague and mysterious, faint, yet of sufficient volume to shake the earth—the sound of numerous snipe beating the peat with their feet to bring insects to the surface. The delicious scent of snipe filled the air; but straight ahead, in the centre of the dry peat-bed, stood a huge white something that held the eyes of all the stoats. They peered at it from one point, then another. They moved to the leeward side to get the scent, and the wind told them that that big, gray, motionless thing was bird. In truth, it was a great black-backed gull, almost the size of an albatross, which, having fed, was dozing peacefully with his head up-wind.

Had it been daylight the stoats would have moved away, but at night they stopped at nothing. Silently now they closed upon the gull, and fell upon him from every quarter with never the rustling of a twig.

With an ear-splitting, terrified croak the black-back rose, thrashing the rushes with his mighty wings. Then from every clump and tuft, from every peat-bed and shimmering pool, there darted a whistling wisp of life, to cleave the air with beating wings and murmurings of alarm. In an instant the night was filled with sound, and other gulls rose heavily from the swamp below. The black-back attacked succeeded in flapping upwards two yards or more. But with him he took the two adult stoats; while one of the youngsters fell at a height of four feet from the ground, to alight, squirming and clucking angrily, upon the spiked rush-tops.

For fifty yards the great bird flew, carrying the two tenacious stoats with him, ere he fell to make a desperate stand. Other gulls came screaming overhead, anxious to lend a hand, but afraid of the dark; and so, slashing his mighty wings, the great gull died without so much as seeing the little vampires that bore him down.

The youngsters reappeared, and the whole family settled to the feast, after which they curled up together in a ball of sleeping innocence under one great wing of the fallen bird. They had left the home den for good now, to live wandering, nomadic lives, sleeping where inclination took them, hunting day or night as fancy dictated, and leaving ever a train of trampled death behind them.

V.

Just before daybreak a blue mountain-hare limped watchfully across the foot of the swamp, and the sweet morning breeze bore his body-scent to the stoats. In an instant they were up, sneaking one after the other in his direction, till the hare, warned in some mysterious way, promptly crossed the burn, then recrossed higher up, thus breaking his line of scent as he made off at full speed.

The stoats struck the line and followed it, bounding from tuft to tuft and running bunched together, giving tongue like a pack of fiendish little hounds. And when the hare heard that sound his ears twitched back in awful horror, his bounds began to lose their vigour, and with the paralysis of terror dawning upon him he crouched to listen—oh fatal move!

Unerringly the ermines followed the trail, bounding back and forth across the burn, following every twist and turn, and so up the sandy track from the lead-mine and under the gate towards the open moor. Here the male stoat paused to listen a moment, then plunged on; but a sound behind told him that another pack of miniature sleuth-hounds had struck the trail they had struck, and were following in the rear.

The hare ahead, weak and prostrated with terror, still crouched motionless, when suddenly across the gray expanse of dawn there came the shrill whistling of a shepherd. Up went the blue hare's ears, pitter-pat went his paws on the plastic peat, and straight across the moor he sped towards that sound.

Man was a deadly foe, to be sure, but none so deadly as the foe behind him now, and who could say but that one enemy might be played off against the other in this hour of desperate odds?

The shepherd saw the hare coming, but this man knew the creatures of the wild, and when he noticed how wearily the animal made its way, dragging one limb after the other as though possessed of a sleeping-sickness, he called his dog to heel, for he knew what was amiss. Thirty feet from him the hare crouched in a rut; then over the heather there came that ghastly death-sound, and, looking up, the shepherd saw the pack of stoats, bristling and furious, heading towards him. For a moment he questioned whether it would be safe to molest them—for the stoats of that moor had a bad name—but his heart was with the hare, and his dog clinched the matter.

That dog, a rough-haired mongrel in whose soft eyes were wisdom and tenderness, hated all stoats since in her puppyhood one had bitten her, and waged unrelenting war upon their kind. With a yelp of eagerness she rushed to meet the pack; while the man, clubbing his stick, followed up to lend a hand.

It was not a pretty sight while it lasted. The stoats never swerved, but came on straight towards the dog, and in an instant there was a whirling, struggling heap, from which the dog emerged triumphant. Three young stoats lay dead; the man killed a fourth with his stick; but this was a fight to the finish, and unwaveringly the survivors of the pack flew in and closed again.

The man looked up and uttered a startled oath, for now he saw a second pack of stoats

prancing towards him and his dog with cries of fury. Too late to back out of it now, so man and dog stood side by side as many a time before, and fought in silent earnest.

Not until nine stoats were killed did the rest desist, to bound off into the heather. Both man and dog were bitten, but now the dog wagged her tail and the man chuckled triumphantly, for over the ridge they saw, for a moment silhouetted against the sky, the erect ears of a hare as he loped off to safety.

VI.

The shepherd left the dead stoats where they lay, and told his dog to mount guard. A little while later he returned with a bundle of steel traps, and set them all about the heather, for he knew the stoats would come back for their dead, as stoats and weasels always do.

Of the family we have followed only the adult male and female now survived, and in an hour or so they came back to search for their little ones. As the female bounded up there was a 'clink,' and a little spume of silver sand rose into the air beneath her. She uttered a chattering snarl, but there was no escaping from the iron jaws that held her by the hindlegs, and as her mate turned to see what was amiss, there was a second clash of hidden jaws, and he, too, fell.

Furiously they fought and snarled, but all to no purpose; and presently from the sky above there floated a sound—a wild 'keer-keer!' The stoats looked up and saw, and understood. They watched with shining eyes as though they beheld the sword of Damocles. There, below the gossamer clouds, floated a mighty gull. Round and round it soared, pivoting over them; then another came, and still another, their wings flashing gold and vermilion as steadily they plunged to earth, there to slash the little murderers limb from limb, while from the crumbling city walls a thousand pairs of eyes looked on approvingly.

FORTITUDE.

FROM out the darkness steals a voice
That breathlessly commands:
O fainting spirit, make your choice;
Fate lies within your hands.

You may not falter in this hour,
Nor count the risk, 'tis plain;
For destiny is in your power,
Although the price be pain.

The sword may cleave, but not destroy
The tissues of the soul,
And from its depths will surge a joy
To make your spirit whole.

From out the darkness steals a voice:
What though the price be pain?
O valiant spirit, make your choice
Your destiny to gain.

DREAMS AND DREAMLAND.

By R. F. DIXON.

I.

A PROMINENT Canadian statesman of advanced age is reported as having said recently that the man who never dreamed never knew what he missed. As a lifelong dreamer myself, who for at least fifty years have never consciously passed one dreamless night, I can fully endorse this statement. Even bad dreams are better than none at all, for there is a solid balance of gain in the delightful sense of relief in waking up from them. The blank unconsciousness of dreamless sleep which some profess to enjoy has no attractions for me. To go to bed and forthwith relapse into utter oblivion seems to me rather a dreary proposition, as compared with the thrilling adventures of dreamland. Sleep has been called 'the image of death.' To the dreamer it is anything but this. It is the entrance into a new and enchanted land, in which anything may happen, and in which he lives with a verve, an intensity, and a largeness absent from his waking hours. Indeed, if the late F. W. Myers, the exponent of the 'subliminal self,' is to be believed, it is only when a man is asleep, and when that part of his consciousness which constitutes about three-fourths of the whole sum of his faculties comes into action, that he is really awake.

Of all dreams, good, bad, and indifferent, the most curious and interesting are those which are continually repeating themselves. I am an Anglican parson of about forty years' standing, with an experience of parish work on both sides of the Atlantic, in city, town, and village. During these busy years I have accumulated a stock of these recurring dreams, which, I suppose, will continue to haunt my slumbers to the end of my mundane pilgrimage.

A very common one is that I have suddenly become conscious of the fact that I have neglected to feed my horse for several days. The poor animal has been standing all this time in the stall without food or drink. I rush out to the stable, but invariably wake before I get there. This, I have been assured by a brother-parson, from his own personal experience, is not an uncommon dream.

A still more frequent dream is that I am at the reading-desk in church, in full canonicals, about to begin the service; the voluntary has ceased, the congregation is expectant, but for the

life of me I cannot find the exact place to begin. Search as eagerly and frantically as I can, I turn up every place but the right one. At last I notice that the congregation is slowly melting away. I redouble my efforts, and then, as the tension becomes almost unbearable, I awake to the delightful reaction of discovering 'it was all a dream.' I often find myself, again, in the still more disagreeable predicament of standing duly vested at the altar, about to begin a celebration of the Holy Communion, and being unable to find one of the elements. Not infrequently I get into the pulpit, and suddenly realise the fact that I have made no preparation whatever, and haven't even chosen a text. But in this case I am generally equal to the occasion. I select a text at random, and plunge into what seems quite an eloquent discourse, but, to my consternation, I notice the congregation silently slipping out by ones and twos. I put more and more 'pep' into my sermon, but to no purpose. The mortifying, not to say exasperating, exodus continues, till I am on the point of adopting some desperate expedient to stop the leakage. I pour forth floods of frenzied eloquence, and just as I reach the 'height of my argument' I awake.

In another recurring dream, which is less frequent than it used to be some years ago, I find that I have suddenly returned home to England unannounced, and that I am about to present myself to my parents, now long departed. I am always aware in this dream of a sort of double personality or consciousness. Having reason to believe that my sudden and unexpected return will not be wholly approved by my parents, and with my boyish awe of my father before my eyes, I find myself rehearsing certain excuses: 'I am a man well over sixty, with grandchildren of my own, and an ordained clergyman of the Church of England of many years' standing,' &c. I fortify myself with the reflection that it would be absurd to rate me like a stripling in his teens, and yet all to no purpose—my dread of the approaching interview will continue to roll back upon me. But that interview never takes place. A short time ago I had a dream of this kind which very vividly illustrated this double personality or consciousness, or whatever you may call it. I had made one of my sudden and unexpected visits to the Old Country, and had

found my parents absent for the day from the old home. To put in the time I sauntered down into the neighbouring village, and called on an old couple (long ago deceased) well known to me in my youth, who asked me to tea. After tea, I strolled with the old gentleman to a piece of rising ground which commanded a good view of my father's residence, where I was born and brought up. I discussed the 'flight of time' in the vein of a man of considerably over three-score, and the passing of so many mutual acquaintances and friends. While moralising on old times and the changes we both had witnessed, I quoted those beautiful lines of Wordsworth's:

'My eyes are filled with foolish tears,
My heart is idly stirred,
For the same sound is in my ears
As in those days I heard.
So fares it still in our decay;
And yet the wiser mind
Mourns less for what time takes away
Than what it leaves behind.'

And all the while, boy-like, I was revolving excuses in my mind against the dreaded interview with my father, which, however, as always, was averted by my waking up. These recurring dreams never come to extremities. Another curious recurring dream is that I have left my parish without giving any notice to my parishioners, and I suddenly become conscious of the fact when I have put about a thousand miles between myself and them—to be exact, about the distance between King's County, Nova Scotia, and, say, the Western Peninsula of Ontario.

A strange thing about these recurring dreams is that, in spite of a subconscious memory of having dreamed them before, they seem to increase in vividness and reality. One finds one's self saying to one's self, 'Well, I've often fooled myself before, but this time it's the real thing. This cannot be a dream.' And the impression persists for an appreciable time after awaking, till the blessed reaction and relief comes.

These dreams are, no doubt, in the majority of cases subliminal memories of real occurrences, lost beyond recovery in my waking hours. During my long ownership of a horse I have doubtless once or twice, or perhaps oftener, forgotten to feed it, rub it down, or bed it up for the night. It is quite possible that on some occasion I may have forgotten one of the elements at a celebration of the Holy Communion. Every parson, it goes without saying, has found himself in the pulpit utterly unprepared, with the horrible consciousness that, while he has to say something, he has nothing to say. And I have no doubt that in my wide and varied experience as an officiant in hundreds of Anglican places of worship, from Lincoln Cathedral to a backwoods Ontario school-house, I have occasionally 'got stuck' in trying to find my place in some unfamiliar or mutilated book. Indeed, as I write these words certain dim memories begin to stir, of my being greatly

perplexed and somewhat flustered while officiating in a strange church, by trying to find my way about in a very elaborately illuminated prayer-book, into which certain *secretæ* and copious foot-notes had been interpolated.

All these recurring dreams, with some exceptions to be noticed later, are no doubt the reawakening memories of long-forgotten episodes or moods. But the wonderful thing is that the awakened subliminal self can take these shreds and patches of memory and transform them into elaborate scenes newly staged, so as to be quite unrecognisable. I often have the flying dream, which, I am told, is very common, but which surely cannot be a memory; as also one of riding on a bicycle, which I have never done or attempted to do in my life.

II.

Again, there is dreamland with its well-defined, well-remembered features. Two dream-roads I often travel, one of them partly Canadian and partly English, in which things are rather bewilderingly mixed up, and whereon I pass the scenes of my childhood and early youth, and those of yesterday, and along the sides of which stand modern wooden Canadian houses and old English thatched cottages within a few yards of each other. This road I often travel, and its familiar features never change. Then there is the road wholly Canadian, and of the western Ontario type—mathematically straight, flanked by typical Ontario homesteads and rectangular fields with their 'snake' fences, and backed up with the continuous line of big timber separating the farms—one of those known as 'Concession Roads.' I seem to have travelled these roads hundreds of times, and they always lead to the same place. The first ends at a town of apparently a few thousand inhabitants, close to the border of Scotland, from which it is separated only by a very narrow arm of the sea. The surrounding country recalls the neighbourhood of the Solway Firth, very familiar to me in my youth, but largely forgotten in my waking hours. The second road takes me to a typical Ontario country-town, which, resembling as it does all the small towns I have ever seen in Canada and New England, and yet identical with no particular one, is probably a composite memory of the hundreds of such places I have visited during my forty-six years' residence on the western side of the Atlantic. You approach it through the usual residential section of detached houses, standing in their own grounds, and fronted by elm or maple trees, pass a church, enter the business district with its rectangular 'blocks' of shops and offices, and descend to a river spanned by a wooden bridge, which I have never yet crossed, and, I fear, never shall cross.

There are certain houses, again, the residences of old friends now long since departed, which I visit from time to time. But these dream-houses,

though vaguely reminiscent of once-familiar buildings, are always very different from the originals as remembered in my waking hours. One in particular I recall which I have visited in the spirit at irregular intervals for many years, and which I dreamed of only a few weeks ago, the residence of an Ontario farmer, a fellow Cumbrian, where I lived for several months, and where I had my first taste of Canadian farm-life. The actual house is (or was) the typical old-fashioned Ontario frame-building, standing close to the 'Concession Road' (to be precise, the 7th of McGillivray), plain and unpretentious almost to ugliness, in the midst of an extensive 'clearing,' as bare of trees as an egg of hair. The dream-house stands nearly half a mile from the road, on the edge of a thickly grown forest, and is an old, one-storey, patched-up, rather dilapidated and rambling building, and one, as in the other case, associated with familiar (if vague) personal recollections. Our dreams are evidently a medley of fugitive memories pieced together apparently at

random, but—that is the strange thing about them—coherently pieced together, with nothing fantastic or inherently impossible or even improbable about them.

As I grow older and my memory gets more and more into water-tight compartments, I find it increasingly difficult to remember my dreams. I wake up with the consciousness of having had numerous vivid dreams, but utterly powerless to recall them. My normal waking memory halts tantalisingly on the brink. I sense, but cannot visualise, them. Hours afterwards during the day fragments of these dreams sometimes come to me. This, I have been told, is a common experience.

Voluminous and diversified as my dreams have been, I cannot at this moment, I must confess, recollect any one that was ever of any direct practical use to me. Nevertheless, I hold firmly to the conviction, already expressed, that they have made my life here, now drawing to a close, more enjoyable and better worth living.

THE PARTS MEN PLAY.

CHAPTER VII.—continued.

IV.

THEY were interrupted by a waiter, who removed the soup-plates with studied dexterity, and substituted *Tronçon de turbotin Duglère; pommes vapeur*, the dish which had delivered the fatal blow against the Cabinet Minister's digestive armour.

'Perhaps I am too personal,' resumed Selwyn after the completion of this task, 'but last night one of the impressions I took away with me was your critical attitude towards your surroundings. Then this morning you were so completely'—

'Charming?'

'—bewitching,' he said, smiling, 'that I thought myself an idiot for the previous night's opinion. But then this evening'—

'Mr Selwyn, you are not going to tell me I'm disappointing, and we just finished with the soup?'

More than her words, the forced rapidity with which she spoke nettled him. With bad taste perhaps, but still with well-meant sincerity, he was trying to elucidate the personality which had gripped him; while she, though seemingly having no objection to serving as a study for analysis, was constantly thrusting her deflecting sentences in his path. To him words were as clay to the sculptor. When he conversed he liked to choose his theme, then, by adroit use of language, bring his artistry to bear on the subject, accentuating a line here, introducing a note of subtlety elsewhere, amplifying, smoothing, finishing with the veneer of words the

construction of his mind. Another quality in her that troubled him was the apparent rigidity of her thoughts. Not once did she give the impression that she was nursing an idea in the lap of her mentality, but always that she had arrived at a conclusion by an instantaneous process, which would not permit of retraction or expansion. As though by suggestion he could reduce her phrasing to a *tempo* less quick, his own voice slowed to a drawl.

'Miss Durwent,' he said, 'you are unique among the English girls I have met. I should think that contentment, almost reduced to placidity, is one of their outstanding characteristics.'

'That is because you are a man, and with a stranger we have our company manners on. England is full of bitter, resentful women, but they don't cry about it. That's one result of our playing games like boys. We learn not to whine.'

'I suppose the activities of your suffragettes are a sign of this unrest.'

'Yes—though they don't know what is really the trouble. I do not think women should run the country, but I do feel that we should have something to say about our ordinary day-to-day lives. Man-made laws are stupid enough, but a man-made society is intolerable. Just a very little wine, please.'

For a moment there was silence; then she continued: 'Oh, I suppose if it were all sifted down I should find that it is largely egotism on my part.'

He waited, not wanting to alter her course by any injudicious comment.

'Mr Selwyn,' she said abruptly, 'do you feel that there is a Higher Purpose working through life?'

'Y-yes,' he said, rather startled, 'I think there is.'

'Sometimes I do,' she went on; 'then, again, I think we're here on this earth for no purpose at all. It often strikes me that Some One up above started humanity with a great idea, but lost interest in us.'

'I think,' he said slowly, 'that every man has an instinctive feeling sometime in his life that he is a small part of a great plan that is working somehow towards the light.'

'Yes. It's a comfortable thought. It's what makes good Christians enjoy their dinner without worrying too much about the poor.'

He made no answer, though he was not one who often let an epigram go by without a counter-thrust; but he could see that the girl was struggling towards a sincerity of expression much as a frightened horse crosses a bridge which spans a roaring waterfall, ready to bolt at the first thing that affrights it.

'Mr Selwyn,' she said—and for the first time her words had something of a lilt and less incision—'do you think women are living the life intended for them?'

'Why not?' he fenced.

'Well, it seems to me that when any living creature is placed in the world it is given certain powers to use. You saw this morning how our horses wanted to race, and couldn't understand our holding them back. A mosquito bites because that's apparently its job in the world, and it doesn't know anything else. I was once told that if animals do not use some faculty they possess, in time Nature takes it away from them.'

'You are quite a student of natural history, Miss Durwent.'

'No—but every now and then mother unearths a man who teaches us something, like last night.'

He acknowledged the compliment with a slight inclination of his head. The waiter leant expectantly beside him.

'To descend from the metaphysical to the purely physical,' he said, glancing in some perplexity at the terrific nomenclature of Monsieur Beauchamp's dishes, 'do you think we might take a chance on this *Poulet reine aux primeurs; salade lorette*? I gather that it has something to do with chicken.'

'It's rather artful of Monsieur Beauchamp to word it so we poor English can get that much, isn't it?'

'Yes. He apparently acts on the principle that a little learning is a common thing.'

v.

As Selwyn gave the necessary order to the waiter, a noisy hubbub of laughter from an adjoining *cabinet particulier* almost drowned

his words. There was one woman's voice that was rasping and sustained with an abandon of vulgarity released by the potency of champagne.

Elise Durwent looked across the table at her companion. 'Are you bored with all my talk?' she said. 'You Americans aren't nearly so candid about such things as Englishmen.'

'On the contrary, Miss Durwent, I am deeply interested. Only, I am a little puzzled as to how you connect the usual functions of animals with woman's place in the world.'

With an air of abstraction she drew some pattern on the table-cloth with the prongs of a fork. 'I don't know,' she said dreamily, 'that I can apply the argument correctly, but—Mr Selwyn, when I was a child playing about with my little brother "Boy-blue"—that was a pet name I had for him—I was just as happy to be a girl as he was to be a boy. I think that is true of all children. But ask any woman which she would rather be, a man or a woman, and unless she is trying to make you fall in love with her she will say the former. That is not as it should be, but it's true. Yet, if we are part of your great plan working towards the light, we're entitled to the same share in life as you—more, if anything, because we perpetuate life and have more in common with all that it holds than men have. There, that is a long speech for me.'

'Please don't stop.'

There was a howl in a man's voice from the noisy *cabinet particulier*, followed by a laugh from the same woman as before, which set the teeth on edge.

'That woman in there,' she went on, 'will partly show what I mean. In the beginning we were both given certain qualities. She has lost her modesty through disuse; I'm losing my womanliness and power of sympathy for the same reason. She's more candid about it, that's all. When Dick and I were youngsters I dreamed of life as Casim Baba's cave full of undiscovered treasures that would be endless. Now I look back upon those days as the only really happy ones I shall ever have.'

'You are—how old?'

'Twenty-three.'

'You will grow less cynical as you grow older,' he said, from the altitude of twenty-six.

'I agree,' she said. 'As, unlike the Japanese, we haven't the moral courage of suicide, I shall get used to the idea of being an Englishman's wife; of living in a calm routine of sport, bridge, week-ends, and small-talk—entertaining people who bore you, and in turn helping to bore those who entertain you. In time I'll forget that I was born, as most women are, with a fine perception of life's subtleties, and settle down to living year in and year out with no change except that each season you're less attractive and more petty. After a while I shall even get to like the calm level of being an Englishman's wife, and if I see any girl thinking as I do now,

I'll know what a little fool she is. That's what happens to us—we get used to things. Those of us who don't either get a divorce, or go to the devil, or just live out our little farce. It is a real tragedy of English life that women are losing through disuse the qualities that were given them. That is why an American like you comes here and says we do not edit ourselves cleverly.'

The rapid succession of sentences came to an end, and the colour which had mounted to her cheeks slowly subsided.

VI.

'I feel,' he said, 'that I can only vaguely understand what you mean. But is it not possible that you are looking at it too much from the standpoint of an individualist?'

'Women are all individualists,' she broke in; 'or they are until society breaks their spirit. This lumping of people into generations and tuning your son's brain to the same pitch as his medieval ancestors' doesn't interest women—that's man's performance. The great thing about a woman is her own life, isn't it? And the great event in a woman's life is when she has a child—because it's *hers*. This class and family stuff comes from men, because their names are perpetuated, not ours. There is no snobbery equal to men's; it is more noticeable with women, because it isn't instinctive with them, and they have to talk to show it.'

'Then,' said Selwyn, 'in addition to an Irish Rebellion, we may look for one from English women?'

'Yes. I don't know when, but it will come.'

He produced a cigarette-case. 'Would you care for a cigarette now?' he asked.

'No, thanks. But you smoke.'

'Poor England!' he said in pretended seriousness, tapping the table with the end of the cigarette, 'with two revolutions on her hands, and neither party knowing what it wants.'

'We may not know what we want,' she said, 'but, as an Irishman said the other day, "We won't be satisfied till we get it." If the rebellion of our women doesn't come, I prophesy that in a couple of thousand years, when the supermen inhabit the earth, they will find a sort of land mermaid with an expressionless face, perpetually going through the motion of dealing cards or drinking tea. Then some old fogey will spend ten years in research, and pronounce her an excellent example of the extinct race "*Femina Anglica*."'

'As one of the tyrants who wishes you well,' said Selwyn, after a laugh in which she joined, 'may I be permitted to know what women want—or think they want?'

'Mr Selwyn, revolutions never come from people who think. That is why they are so terrible. The unhappiness of so many English-women comes from the life which does not demand or permit the use of half the powers they possess. Nor does it satisfy half their longings. Such a condition produces either stagnation or revolution. Our ultimatum is—give us a life which demands all our resources and permits women unlimited opportunity for self-development.'

'And if the men cannot do this?'

'The women will have to take charge.'

'And when does the ultimatum expire?'

She shrugged her shoulders.

'When will the next great earthquake be?'

(Continued on page 133.)

THE FIRST DAYS OF AN EARLY VOLUNTEER.

By A F. S.

'COME quickly, gentlemen, or you'll no can get fell in.'

Such were my instructions from a Scottish sergeant when, during the first year of the war, I, like many others of the older men, began to essay the noble art of self-defence by becoming a Volunteer. Need I say that I, too, am a Scot, and that the *locus* of all my trials and troubles was in Scotland? The troubles began early—with the first trial. Until then I had always flattered myself that I could walk. I now found that walking was out of date. I had to march; and, after being insulted by being asked if I had the ordinary complement of (a) feet, (b) toes, with a considerable expenditure of time and some patience on the part of the deputy instructor, I learned to march, 'Left, right; left, right. Mark time!' if not correctly, yet at least so as

to escape the special notice of my mentors. The same may be said about the rudiments of drill. At the commencement of the formation of fours—an awful rite—I found myself, after instruction, very like my poet-friend who in his verse 'Form Fours' says:

Of course, if you don't think deeply, you do it without a hitch;
You have only to know your right from your left,
and remember which is which;
But as soon as you try to be careful, you get in
a deuce of a plight,
With a pace to the right with the left foot, and
one to the rear with the right.

With the result that this happened:

In my dreams the sergeant, the Kaiser, and
Kipling mix my feet;
Saying, 'East is left, and Right is Might, and
never the twain shall meet!'

In my nightmare squad *all* files are odd, and their fours are horribly queer; With a pace to the left with the front foot, and one to the right with the rear.

But after a time things became a little easier.

The same might be said for formations. At first, 'On the right' (or 'On the left') 'form squad!' and 'Right turn!' and 'Left turn!'—all of which seemed more or less the same to us, and we acted 'as sich'—resulted in horrid cleavages; but eventually, with a certain maidenly modesty and hesitancy on the part of the unfortunate right or left hand man, who felt the eyes of Europe were upon him, and frank terror in the faces of those in the centre, all came right as a trivet, and there was peace.

But we had many things to learn at once! Our native politeness, which desired humbly to apologise for things done wrong, was subdued at once by the bellow, 'No civeelities from the ranks!' and a horrified silence ensued. Similarly, discipline was maintained under the gentle reproof, 'I said, "Slope arrums!" I never told you to open and climb up an umbrella!' Nor did we even faintly smile when addressed somewhat in this wise (as one of our squad alleged) by one of our mentors—or tormentors: 'The chief beauty, gentlemen, of this movement is its vulnerability. You will obsess your minds, therefore, of all mundane thoughts and fix them incontinently upon

this movement;' for he liked long words, and, like Mr Rugg, 'was considered to possess a remarkably good address.' If we smiled, he withered us up with a look. If we panted at the 'Stand easy!' he glared. If we did anything wrong—and we generally did—he howled. So, thanks to him, we learned the beginnings of drill and discipline, for which we are now very grateful.

Then the movement grew and grew, and introduced us to lethal weapons and awful things such as haversacks and straps. The writer, being what the Scots call a 'handleless loon,' was soon in the toils of the said straps, and at first managed to make himself and his two neighbours in rank perfect Laocoöns. There were humours about the straps and the belts, however—for instance, when one was first fitted into both and marched round the drill-hall, and, suddenly, the belt of the Daniel Lambert of the corps burst with a report like thunder, and the buckle, after flying through space, fell with the noise of shrapnel!

I forbear to talk of musketry and the joys of rifle-cleaning (for there is a joy in getting oily, as every child can tell), as my paper would get too long, and we should be in real organised Volunteer work—which was very serious and excellent work—before we knew where we were. I only want to put before you the early beginnings of the movement, and to laugh with you over our earnestness, inefficiency, and goodwill.

MR PHIPPS OF 'THE OLD FIRM.'

PART IV.

ANOTHER three weeks gone, and Ruth and I were in her dining-room one afternoon that was very cold and black outside, but cosy for us by the big fire. For the ease of my leg I was on a couch, yet fully dressed, in a new suit and peruke which she had bought for me at Dover in place of poor Mr Phipps's, spoilt in the lane. And she was playing at brewing tiny bowls of China tea, and chatting gaily to keep up both our spirits, for the hour was anxious for us. Orlebars, who had shown himself throughout a most sincere friend, finding me nearly well enough to be removed, had ridden to London some days before to make his report to the authorities, and with the intent of urging everything he could in my favour. From which much clemency, or none, might result. He had promised to be back this afternoon.

'And withal he suspects of the letters,' said Ruth, smiling into her tea-bowl. 'I know it by the teasing look he gives me. Those men have told him of me and Colbran afoot at "Gospel Oak"—groping for a stone in Tommy's hoof!—and of our riding in from the coast. I wonder what he doth think of me!' She moved her head in mock apprehension. 'I am glad he is not so outspoken as Peter Middleton.'

'Peter Middleton!' I exclaimed. 'Was he

at the beach? I never asked you. Why, what had Peter to say?'

'At the very first?' She spoke in a fashion that puzzled me, and her smile changed, becoming brimful of mirth, yet most inscrutable.

'Yes,' I said. 'All young Peter's sayings amuse me.'

'At the very first'—She gazed down, her cheek colouring fast, and her voice shy, though vibrating with laughter. 'At the very first—he said I was so pretty a slip I were best cross to France with him.'

'He did!' I shouted in violent anger.

'But on my telling him I deemed Lord Sayer would object, he being my husband'—She broke into ringing laughter. 'Dick, his was the most plaintive, desperate apology ever made. Oh, I could but pardon him! . . . Anon, though he was for rescuing you, he was not difficult to dissuade, being in no wise eager to meet you face to face.'

Then I laughed also; and gossiping thus lightly, we continued until the trot of Orlebars's horse sounded in the grounds.

Ruth grew white immediately. Perchance I did the same. She left her chair, coming to sit on the couch and taking my hand.

'If he has influenced them to do nothing further! If—Dick!'

That was her constant dream. But I shook my head.

'It will be either committal to the Tower or the worst—to stand trial for my head.'

'They durst not!' she said fiercely as a child. 'They durst not! Lord Sayer to the scaffold! Nay, they will be afraid. You are too big, Dick. You are too big!'

'Not so big but they will dare, if they have the evidence. Yet I think indeed that you have spun them there.' I held her hand against my cheek, against my lips. 'Oh, what matter, sweetheart! I have won more than I can lose on this venture. For these few weeks I have gained you, that my life was only grief without.'

'For these few weeks?' said she, sinking her head down to that hand so that her lips were very near me. 'For always. . . Did you sometimes marvel that my name was Ruth? Verily did I. But now, my heart, I say her words, "*Whither thou goest I will go.*" . . . If you are left free, take me where you list. If you are put in the Tower, I will lodge by the wall. If—if it is death for you, Dick, I think it shall be death for me'—

'Nay, sweetheart!' cried I, aghast. 'Child, what are you saying?'

I turned my face to her, and we were chin to chin. Her blue eyes, darker than I had ever known them, mournful and steady, would not waver for mine.

'Yes,' said she. 'I shall pray to be forgiven, and then'—

'No!' I said hoarsely, gripping her to me. 'No! I bid you. Would you make my last days torment? Would you part us for ages in the afterwards by such a sin?'

'Dick! Dick!' she entreated helplessly, with her arms around my neck.

'No!'

And thus we were until Orlebars tapped on our door. Then, clasping my hand still, she sprang up, and stood very erect to see him enter.

From a London Newsletter dated July 15, 1697.

'A talk is that the Lord Viscount Sayer, being released Thursday was se'nnight from the Tower, is already crossed over to France with his lady, whose going thither is a great amazement to all, she being thought mighty hostile to the St Germain party.'

THE END.

QUEENSLAND'S BLUE LAKE: EACHAM.

IN Queensland, a pretty lake nestles on one of the highest points of the mountains in the hinterland of the rising seaport town of Cairns, at an elevation of 2500 feet. It occupies the crater of an extinct volcano, and is named Eacham. About one and a half miles long by one mile wide, with a depth of about 300 feet, it contains an endless supply of beautiful fresh-water. To the aborigines the lake was always 'taboo,' and it is so still. Although they will hunt wallabies, paddymelons, and other marsupials by daylight in its vicinity, they will never camp near it of a night, fearing the 'Devil Devil' that lives in it, as they say. Possibly this is a tradition handed down from the time when it was an active volcano.

The lake is generally understood to have only small fish in it; and the only water-fowl I saw there were two pigmy geese. Strange to say, I did not see any water-lilies or weeds of any kind in the water—nothing but one placid, clear, blue expanse. At first I thought the intense blue was the reflection of the sky; but later in the day, when the sky became overcast with clouds, the water remained blue.

My two companions and guides were, like myself, true Queenslanders, devoted to our native wilds. I shall never forget the romantic drive we had over a rough bush track, in some places not wide enough for two vehicles to pass, with the sun completely veiled by the

canopy of immense tropical trees, palms, lawyer vines with talons on them like an eagle's, ferns and orchids in thousands clinging to the trees, and long festoons of moss. All was silent in the depths of this jungle except for the twitter of beautiful birds and the occasional note of the whip-bird, which resembles a whistle and the crack of a coach-whip. For four miles we proceeded at a walking-pace, jolting over the roots of trees amidst the weird surroundings of what had been, only a few years back, a dangerous spot for the pioneers owing to the treachery of the aborigines. Now it is safer than the back-streets of many a city I know.

Presently a bright gleam of daylight appeared, and our driver pulled up on the verge of Lake Eacham. We were now gazing down on one of nature's masterpieces. The intense yet varying shades of the tropical green jungle ran over the lip of this old crater for about fifty feet, right down to the water's edge, and made the frame of a natural picture such as human effort could never approach. So far as I knew, we were the only human beings within four miles of the spot. We all felt that a swim would be refreshing; so, after securely tying up our horses to the limbs of a fine silky oak, we promptly undressed and dived into what was generally considered a bottomless lake. After swimming out about a hundred yards I noticed that the water changed from cold to lukewarm alternately,

and concluded that too much of this was not congenial to one's peace of mind. My younger friends had also noticed this peculiarity, but were free from any fear of cramp. By the time they had swum back I had dressed and got the fire going, with the billy swung for tea. As my countrymen stepped out of the water I could not help admiring their athletic figures. This was about two years before the war commenced. Now, alas! both have given their lives for the old flag we all love; Lieutenant H. Cannan lies at Gallipoli, and Lieutenant Colville Muir somewhere in France.

The State has reserved the frontage of this pretty place for a public park, and no doubt it will some day be a rallying-centre for tourists, particularly as a railway seventy-five miles long runs from Cairns to within four miles of the lake. Scientific readers may be interested to know that this lake has no apparent intake of water, except what runs

down the side during the wet or rainy season, at which time it never shows a rise of more than four feet in its level; at other times it remains stationary. Strange to say, the sources of three large rivers are traced to the neighbourhood of this lake, yet Eacham has no apparent overflow. The surrounding country for miles and miles is composed of a rich chocolate volcanic soil, in some places going down seventy feet, and at the present day the district is a network of dairy and maize farms. In effecting this there have been destroyed by fire thousands upon thousands of such fine trees as silky oak, walnut, bean-tree, maple, and elm, not to mention other choice kinds of timber used for furniture. This destruction is still going on; and in reply to my inquiries a lumberman informed me that, with silky oak at nine shillings per hundred feet, it did not pay to go to the expense of hauling the timber to the railway.

THE RETURN.

PART II.

I.

DAYAL RAJHA counted the houses on the right-hand side from the temple, and stopped at the fourth. The door was open, and he looked in. On the walls of the front hall were nailed bright German lithographs of Krishna and the milkmaids in the forest, Lakshman stringing his bow, and other figures from the Puranic legends. A man's coat and turban hung from one of the red-lacquered pegs. On a heap of country-made quilts in a corner a little girl of six or seven lay naked, fast asleep, one hand upon her face. Beyond, he could see the dark central room with its large clay pots for grain, and beyond that again a kitchen with a door open upon a sunny garden at the back. As the door on which he leant gave a creak, the girl-child opened her eyes with a smile. But when she saw a stranger, she scrambled up and ran within, crying loudly for her mother.

'Mamma, mamma, there is some one here in the house,' he could hear her calling as she ran.

In a minute or two a woman appeared, her eyes a little heavy with sleep, pulling her mantle hastily over her disordered hair. She sat down on her hams at the inner door of the hall and made a sharp gesture with her head. 'Who are you? What do you want?' she asked with a brusque indifference. 'Do you want Jetra?'

He stared at her silently, slow to comprehend. She was a woman passing middle age, the parting on her head broadened by coming baldness, with crow's-feet at the corners of her eyes and two

deep wrinkles between the eyebrows. Her lips closed firmly over her teeth, and the lines at her mouth were strongly marked. The flesh at her throat had fallen in a little, and there were hollows between the neck and the jaw. The waist had lost its shape, and the breasts, half-revealed by the narrow bodice, were of a loose and flabby fullness. For the rest, an agreeable enough figure of a middle-aged woman; a good housewife, one would say at a guess, with not a little of a managing temper; one who had seen the world and remained sound in limb and in mind. There was a friendly humanity in her look, though her lips and well-squared chin spoke of will and determination.

Dayal looked at her curiously, and wondered if this could be the wife he had left. It came as a shock, this revelation of her age and altered temper—this settled, tried, and strengthened woman who had grown upon the blooming girl from whom he had been torn. Yet surely she could be no other; of that he was soon aware. She had spoken of Jetra familiarly as of a son, and she bore herself as the mistress of the house. And when he looked intently, he seemed to make out the same gently curving line of nose, the large brown eyes, the general build and habit of body.

'You have got a good house here,' he said, feeling clumsily for some way to break upon his subject. This middle-aged woman sitting quietly and firmly before him made things not so easy as he had imagined. He had pictured himself supporting a weak girl, fainting in his arms with joy. He knew now there would be no fainting; and he feared, with a sudden fear,

that there might be no joy either. 'Quite a good house you have. You are surely fortunate.'

'Well, I suppose you do not come waking folks from their sleep to tell them about their house or furniture,' the woman answered with a smile. 'Come on, out with it; say what you have got to say, and then you can go. I'm not old enough yet to sit gossiping with strange men, especially when they have not the usual strangers' courtesy to call me "sister." What do you want, good man?'

Dayal stood silent for a moment. Then, with a voice that was harsh with emotion, he said to her, 'Don't you know me at all? Don't you see why you cannot be called "sister" by me?'

The woman looked up and her eyes met his. A sudden astonishment came to her features as she half rose from the ground. 'Say that again,' she commanded. 'I want to hear your voice again.'

He repeated his phrase in strained tones, and he muttered other words, meaningless sounds, words without sense. His arms opened weakly in a nerveless gesture. She rose altogether now and came a step towards him.

'Why, if it isn't—yes, I do believe it's Jetra's father!' she cried in a tone of bewilderment. 'Well, well, how things do happen! So here you are at last, and a nice long time you have kept me waiting without even a letter or a message, and me to look out for myself and feed the child and keep the house going. Well, of all the— However, as you *are* here, you had better sit down now. We cannot have you going off again at once. Better come into the next room. Here, sit down here. Can you not hear what I am saying? Have you had anything to eat yet?'

II.

The man sat down as if bemused, obeying, for all he knew, without volition. It was all so different from what he had expected, as though in a collapsing world he had suddenly fallen upon another birth in a transformed constellation. Who, then, was this? This quiet woman, who ordered him about so sedately in a sort of cheerful indifference? He might have been prepared for anything, for tears or smiles or rage or repentance, anything except just this easy security, this undisturbed and coldly kind tranquillity.

In broken sentences, with odd hesitation and pauses, he told her that he had returned the previous morning from the Andamans on release, that he had taken the night-mail from Bombay, had arrived at the station that morning, and had walked over to Avlash at once. No, he had not eaten yet. He did not want anything to eat. He wanted to understand things—who were the children, for instance?

'Now, for Heaven's sake, don't begin to worry your poor tired head,' she interrupted. 'You just remain quite quietly here, and don't think of anything except a good rest, and I will have a stew

and some nice warm bread ready for you in half-an-hour. After you have eaten and are refreshed, you can talk as much as you like. In fact, you will have to, for there are a great many things you have to explain to me; and I doubt Jetra will not be any too easily satisfied.' Then she turned to a boy of ten who had come in with the little girl and stood holding on to his mother's petticoat. 'Run along, sonny, and go to the field and tell Jetra he is to come here at once. There is a man here whom I want him to meet.'

Then she went into the kitchen, and he could hear her moving pots and pans, and blowing the fire, and getting ready a hasty meal. And he had remembrance of earlier days and another kitchen with a young girl hovering eagerly to her husband's welcome. The little girl kept running in and out between her mother and the room in which he sat, and would squat in front of him and gaze at him, wondering, with round eyes. He smiled at her, and she smiled back, till she came to sit beside him, and touched his coat and sleeve, and at last with a gurgle of pleasure got fairly on his lap and went to sleep against his breast. And the convict swung her gently backwards and forwards in the crook of his arms and watched the closed eyes in a sort of happy daze. His wife found them like that when she brought in the dishes.

'I don't suppose you saw many children out there,' she said, 'across the black waters? She is a good child, isn't she? But I will take her now, while you eat.'

He would have touched her as she bent over, but she seemed unconscious of his movement, and lifted the child quietly from his arms.

When he had finished his meal and had drawn a few puffs at the pipe that his wife—was she still his wife?—had filled for him, he heard loud, firm footsteps at the door of the inner room.

'Here is Jetra,' the woman murmured quietly. 'Now, be careful how you behave with him. He may be rather stiff with you, you can understand.'

Inquiry in his look, Jetra entered the room where they were seated. His mother bade him sit down, and told him to look upon the stranger from over the seas. Then she added, 'He is your father, Jetra. He has just returned.'

III.

The long summer afternoon passed painfully for the older man in a constant reiteration of questions and recriminations. His every word was weighed and discussed, brought back again to refute him, hurled at him. He found nothing of reverence for his years, of pity for his sufferings. He was the accused, on trial before his own offspring; an accused to be plagued and worried and cross-examined, to be doubted and rebuked and censured. 'What have you come here for now?' had been Jetra's first words. And this was the query to which he always returned. This father, who had come back, unknown and

unwanted, from the ends of the earth after all these incurious years—what had he come for, what exactly did he want, how could he be most cheaply satisfied?

'Look at the disgrace, mother,' Jetra had once dared to exclaim. 'People have forgotten all about him. We were well regarded, and now'—

The police were the matter of another thought to which the young man kept recurring. He saw the house open to constant police visitations, constables coming at all hours with schedules and papers to sign, bribes to be expended, a respectable family become suspect. It was the shutting of a door upon many aspirations, and Jetra's disappointment overflowed.

'He left us alone to starve or live, to sink or swim, for twenty years. Why need he have come back now?' he exclaimed again and again. For the son's spirit had been lulled to the proprieties, and he had an almost physical repugnance to the living reminder of disgrace. One thing was clear, that, whatever else be done, in the family farm and in all the management of house and home the older man should have no share or part. He had left them when they had nothing, and he could not come back now to control or meddle when they were comfortably settled in a quiet way. If he was to be cared for at all, it must be as a dependant in the kitchen-corner. And it was only right he should work and repay his keep, like any other labourer or poor relation. Otherwise he could go to the factories in the city and earn his own livelihood. It had been harder labour in the hulks.

'We cannot afford useless mouths, that is true enough,' the woman had agreed. 'Do you hear what your son says?' she added, turning to the poor cowed creature that sat there in a silence as of death, overwhelmed by the bitter flow of words. 'If you come here, you stay in charity, that must be clearly understood, and you have nothing to do with the house or our arrangements. And if you don't like it—well, the door is always open. We have had to do without you for twenty years. We can make shift without you again.'

And once more the ceaseless argument began. Jetra's wife sat beside him and interjected shrill complaints. She had not married to have a convict always beside her, a man who had even forgotten his own language and could barely utter what he had to say. Her father would never have given her to such a family, if he had ever guessed the old man could return. God be thanked, her father's house was large and she could always find a corner there, where she could live and die—alone, if need be, without her man.

IV.

So the afternoon wore on wearily, while the fierce heat of the day somewhat abated, and, as the sun dropped slowly down towards the horizon, the village awoke to its evening labours.

Men passed along the street to their fields, and the bell in the little temple near them clashed from time to time, as passers-by stopped for a hurried prayer. The dust rose thick like a garment as cattle huddled past to their stables and scuffled at the narrow lanes and turnings. Every now and then a woman, pausing, would shout a word or two of greeting to those in the house, and the argument would be hastily hushed while she was answered and sent away as best they could. For a long time the older man had sat silent, without an attempt to stem the clatter of the others' tongues. At last, with a visible effort, he roused himself from his lethargy and pointed his bony finger at his son.

'Be silent now,' he said. 'I have learned my lesson and have understood. You have no cause to cherish me, that I know; but I thought you might be kinder. Whatever is written in fate, that befalls, and it is not in man to cure or to avoid. Mark that, Jetra, for maybe your fate too is even now hanging over your head. I was young and careless; I meant no wrong; I did that which I did without malice or forethought; yet I have had to suffer. Him whom I killed I hated, and he hated me. We met one evening—the public place before the meeting-house—and he mocked me. Worse, he mocked your mother—the woman who now sits here, and who then was young and fair and pure. He called her harlot and he called me blind. I knew it to be a lie, vile, a mere coward's insult. And I became a thing of rage, wind-drift before the blasts of hate. I struck him on the lying mouth and felled him; my hand sought the dagger, and buried it twice, thrice, in his neck. It was hours before I knew myself again. Long before, I was already bound and under arrest. They tried me for murder, and the sentence—for I was a young man, and the killing sudden—was transportation for the period of my life. And I laboured in obedience and good work for remission of sentence that I might return. And now I know that hanging had been better. But it is over now. Give me food and bed to-night. That cannot be much to give. To-morrow I shall go away and find work elsewhere—in the factories or in the fields.'

Jetra had sat dumb while his father spoke, and something of shame settled like a cloud upon his face, as if at last he felt that he had gone too far. 'You press the thing too hard,' he murmured. 'Of course, we do not want you to go away at once. You can stay here, if you like; only, you can see yourself that it is not altogether easy to manage. And, after all, you are a weak man, and I have been accustomed to do everything.'

He was going on in the same strain, as if seeking palliation from his own heart, when his mother interrupted.

'Be quiet, Jetra,' she said; 'and you, too,' she added, turning to Dayal, 'while I tell you what is to be done. And you, Jetra, tell that

worthless wife of yours to stop snivelling at once and cook our dinner, or I shall give her more than the rough side of my tongue. She will have something at her ears in a moment that she will not forget for a long time. Now, listen; this is how the thing stands. First of all, Jetra has been making a fool of himself talking of *his* house and *his* fields and *his* God knows what.—Sit quiet and hold your tongue,' she added, turning sharply to her son; 'it is I that am talking now; your turn is done for the present.—Jetra has, as a matter of fact, no house or field at all. He has had two fields, that is true, but they still stand in the village registers in the name of Dayal Rajha; and now that their owner is back again, Jetra has nothing more to do with them. And the house and all the other lands are mine, and will belong to this other boy and girl when I am gone, and not to Jetra.

'Now you, Jetra's father, listen here. When you were taken away, I lived alone for six years, and looked after the infant, and kept myself chaste for you, and hoped for your return. But you never sent me a line of letter or a word of mouth. You have told us to-day that you did not know how to get a letter written or how to send it, that you were ignorant and frightened. Well, I still think you could have got some warder or found some cleverer head to do it. However, that's gone and past, and it's no use fretting over it now. At any rate, there was the fact. I knew nothing more about you, whether you were dead or alive, whether you could ever return. I got nothing from you, and had to do the best I could myself. Well, the villagers helped me, and I got a little rent for your two poor fields, and I went for months at a time to the salt-pans and worked there in the burning sun, while the glare of the white salt seared my eyes, and my hands and feet were cut and chapped and blistered, and my skin grew dry enough; my back ached and ached from the constant stooping. But I kept this boy alive.

'In the fifth year Purtab Guman, that was a widower, took a liking to me. He was well enough off, and he promised to be kind to Jetra, and he kept his word. He sought me, not dishonourably or lightly, but in marriage. By my own Koli law, three years of desertion were enough to give me the right to marry again, as a free woman. But five years had gone by, and I waited yet another, while he pressed me hard before I would consent. Then I married and went to his house. I bore him two sons and a girl. One boy is dead; the other is here before you, and you have already rocked the girl to sleep in your arms. I lived with him as a good wife, and he was a good man to me, too. I could have wished none better. And since his death, four years come New Year, I have looked after his house and property, and kept his name clean and respectable. So now you have the whole thing clear. The house and the property are mine, and they

are mine in trust for these children. Neither you nor Jetra has any right whatever over anything here. However, Jetra has been managing it for me since my man's death, and it is convenient he should go on doing so. On the other hand, you are old and weak now, and you were once my lord, and your shame is my shame and your son's shame, and we have no call to be judges upon you. I will be no party to your being sent away. Here you are, and here you can stay as long as you like, until your hour comes and your eyes are closed in death. But, if you stay in this house, it must be with no rights of mastership; and in return for your board and keep, it will be well that you give your own two fields also to my care. And I will see that no one—neither Jetra nor his dirty little wife nor any one else—shall ever hurt you in act or word, so long as you remain true to the agreement and do what you can to help us. You are weary and broken, and need a rest. Very well, you can get it here; but remember that you have no rights either over me or over house or home. I have been twice widowed, and I own no master now.'

Jetra sat silent now, his face bent down, with his eyes quickly glancing under his brows at his father's face. The old man's fingers played idly on the ground as he strove to arrange his thoughts and order his will. At last he nodded in weary acquiescence.

'I agree,' he said. 'You were quite blameless in what you did; it was your right; you are in the right again. I will do what you want. I will stay here with you all and help.' Then he added, rather sadly, almost below his breath, 'I have no claim upon you now, whatever I once had, of any kind whatever.'

Hardly had he finished when the woman was on her feet. 'Very well, that is all settled now,' said she, 'and we must never discuss it again. I am going to see how dinner is getting on. I cannot trust that silly girl.—You, Jetra, take your father to the headman, and give the information that he has returned on release and is going to live in the house of Puttiba, the widow of Purtab Guman. Better tell him also that we shall give a feast to the village on the occasion, and ask him to invite the constables from the outpost, so that we shall have no further trouble.'

V.

Dinner was over, and the children had been put to bed. Jetra and his wife soon followed. Dayal and the woman who had once been his wife continued to sit in drowsy meditation on the doorstep to the small garden. The air remained parched and hot, and the walls of the house were still warm to the touch. But the first cooler breezes began to breathe upon the stillness of the night with promise of some hours' mitigation in the summer fierceness of

the heat. Overhead ten thousand stars shone like brilliants upon the dark blue curtain of the sky. On the village walls a peacock raised his harsh cry, and was answered by the calls of his mates. On the doorstep the former convict leant back, tired by the heat and the weariful excitement of the day, and thought, half in regret, of another land in a softer, languid climate; of islands where cold was unknown but the air was never dry or burning, where orioles and humming-birds flew twittering from twig to twig or poised, tremulous, before the scarlet hibiscus. He could hear again the long, low roll of the surf upon the shore and dew-drops pattering on the broad palm-leaves. And once again in the thickness of the tropic forest he seemed to see the convict-gangs and feel the bitterness of unwilling toil.

His thoughts came back to the voice of the woman beside him, speaking softly in the darkness.

'It's a long, long time,' she was saying almost to herself. 'Years of work and striving! You too, I suppose, knew other women over there. But why should I ask? Of course you did—bad women, women who had done great crimes, God help them! . . . And after all these years you are back again, a poor weak man, broken and weary—poor old man! And I am getting an old woman too, God knows, with wrinkled face and faded figure. The mother of four children, too! Well, well! it is no use troubling. Come along,' she continued in firmer tones,

getting up; 'it is time to sleep now. You must be tired enough, and it is time for me too. You had better get off to your bed, and I shall shut up the house.'

They stood beside each other on the step, while he sought some phrase of thanks and good-night. By the glow of the kitchen fire she could just see his face, lined and early old, turned towards her. There was a light of timid appeal in his eyes.

'And so you really knew me again when you saw me?' she asked quietly.

He nodded gently. His look seemed rather firmer now, more full of purpose.

'I think I am too old now. I wonder if any man could care for me a little still?' she asked in a low voice.

For answer he stretched his right hand to her shoulder and put it round her neck. He could feel her catch her breath a moment at the touch. Then she spoke out again in her usual calm and kindly tone, with just a trill of gaiety and laughter in her voice.

'Well,' she exclaimed, 'after all, I shall not be sorry to have a man in the house again. It is pretty dull being by one's self. Only, remember what you have promised—no claims and no rights! And, now, do shut that door. It's time we went to bed.'

And Dayal shut the door with his left hand, but kept his right arm tight where it had found a home.

THE END.

THE SIGNING O' THE CALL.

By ALBERT G. MACKINNON, Author of *Hospital Jock*.

I.

'HE'S no soond on the fundamentals, an' I'll sign nae call tae him.'

The words fell like the sentence of doom on the little gathering in the church of Balnacroy. The few young men in that remote Highland congregation had set their hearts on the Rev. Hector Macleod, and the young women were behind them; but now they realised that, in their haste, they had forgotten to be tactful. In their desire to get this young man to be their minister, they had overlooked the necessity of taking Sergeant Roderick M'Luskie the right way.

He stood there in all the imposing height of his six feet, with squared shoulders to match, and a bearing that had once made him the idol of the old 42nd. From underneath bushy eyebrows fire flashed. That same glance had struck dismay into the heart of many a Boer in South African days; now it quelled rebellion in the breasts of the Balnacroy church members. It was not the influence of wealth that told.

M'Luskie was not a rich man. His farm was a small one, and he lived a simple, honest life. The blacksmith and the grocer in the little village had bigger bank accounts. So it was not the threat of the loss of a goodly subscription that appalled; it was the personality of the man. The sergeant was not an individual to be disobeyed, and no one could say why he had this power except that he was just Sergeant M'Luskie.

'For eicht years I hae walked past five kirks every Sabbath mornin' to worship here,' continued the sergeant, with great deliberation and emphasis, 'an' ye'll a' admit we hae got guid doctrine frae him that's awa'. We hae been fed on strong meat, an' I for ane canna stummick the milk-an'-water o' this youth's teachin'. He'll no be allooted to gang intae that pulpit, that has echoed wi' predestination for twenty years, with my consent. The verra thocht o' it wud mak' the godly Hamish Mackintosh turn in his grave. I was loyal tae him when he was alive, an' I'll be loyal tae him when he's deid.'

Thus the Past laid its silent hand on the Present. The sergeant had certainly imbibed

the sermons of the Reverend Hamish, and it was even whispered that when alive that teacher was not infrequently afraid of his own disciple. His doctrines had become petrified in the stern, dour soldier.

'I dinna grasp yer point. Truth has mair sides than ane,' ventured Ronald M'Fadyen, the tailor, in almost an undertone, not daring to meet the sergeant's glance.

'Ay, ye are ane o' them that wud pit a piece o' new cloth on to an auld garment, an' that which is pit in tae fill up taketh frae the garment, an' a sorry rent is what ye hae left. Na, na; the auld truths are guid eneuch for me, an' I dinna want ony patchwork,' was the sergeant's crushing retort, the sting lying in the fact that the tailor was accused of using shoddy material.

Silence followed M'Fadyen's discomfiture. No one had sufficient courage to enter into the breach, and the sergeant's eyes wandered restlessly round on the faces of the congregation, seeking whom they might devour if, by chance, revolt should find expression.

At last one youth, egged on by feminine nudges, rose to his feet. 'Talk o' the papacy!' he began in rather a sneering tone. 'I think we hae got it in Balnacroy. I speak for the young people o' the congregation.' Then his eye met the sergeant's, his voice faltered, he stuttered, and ended in feeble tones, 'We—er—demand—freedom.'

'Freedom to dae what ye like wi' the Scriptures—that's what ye want, young man,' responded the sergeant in scathing tones. 'Ye sigh for the flesh-pots o' auld wives' fables, an' spurn the manna o' soond doctrine. Ye wud try an' tak' the Gate o' the Kingdom aff its hinges wi' yer preachin' o' Free-Wull.'

No response was forthcoming to those words that burned with their fervour of holy indignation. Perhaps no one dared to face those flashing eyes; perhaps none could think of a fitting reply. The sergeant was to receive his answer to the theological problem he had enunciated in scenes far different from that peaceful glen.

In the meantime M'Luskie had triumphed. All hope was crushed of sending a unanimous call to the Rev. Hector Macleod, whose supporters, guided by the ultra-orthodox interim moderator in the chair, resolved to sacrifice their candidate rather than proceed to his election at the inevitable cost of a split in an already tiny congregation.

II.

Hector Macleod sought his way to a villa on the outskirts of Inverness. His heart was heavy, and for the first time his feet lagged on that journey. The burden that weighed him down was contained in an envelope which he carried in his pocket. It was a letter stating that Balnacroy had failed to elect him.

Before he reached the door it was opened, and

a girlish figure came running to meet him. 'Fido heard your step,' she called merrily, 'and he is quicker than I.'

The spaniel was already adding his welcome, and he had not the modesty of his mistress to restrain his demonstrations. He liked Hector best of all the young men who frequented that house, for with his canine intuition he could scent true character. The response he got now was rather disappointing. He recognised before his mistress that something was wrong.

'Well, what is your news? Good, I am sure. I have just been hearing what a pretty manse there is at Balnacroy—at least, how it could be made beautiful with a little taste,' continued young Elsie Smeaton.

'Unfortunately congregations, when they are calling ministers, leave out of account the most important factor, the future mistress of the manse; and yet how much of the success of their work depends on her! Had Balnacroy sent a deputation to interview you, that would have settled the question right off,' said the probationer chivalrously.

'So they and I disagree on one thing,' replied the girl, with a laugh, as she led the way into the house and entered a cosy sitting-room.

'What is that?'

'You—you dense boy!'

'I don't quite see—the point,' he stuttered as he took the proffered chair.

'Explanations blunt it. I like you, apparently *they* do not, and therefore I shall never like *them*.'

'That is their misfortune,' interrupted Hector.

'Rather it is their fortune not to know what they lose,' was her repartee. 'That is the compensation of ignorance. Tell me what made them shy. Your frown? It sometimes displeases even me, as at present. It could not be your beard, for you have not got any; only, perhaps they quarrelled with its absence. The ministerial fashion in Balnacroy is no doubt a shaved upper lip, and the moustache worn under the chin.' So she rattled on, trying by her banter to chase away the cloud of disappointment.

'No; it was my doctrine. It was too broad for them,' he replied gloomily. 'The Rev. Hamish Mackintosh spent all his life in "fencing the tables," as it is called. They say he was at his best on those occasions when he was expelling the goats from the flock. He has managed to leave behind a very small space of barbed-wire enclosure, with the elect inside, and Sergeant M'Luskie in the centre keeping guard. The man who tries to break through does so at his peril. I got caught on the barbs, and the sergeant finished me off.'

The girl smiled. 'You will have to attack a less fortified position next time,' she said. 'After all, there were possibly too many nettles and thistles round the manse in Balnacroy for my taste.'

'I have made up my mind that there is to

be no next time. This method of candidating for a church, of fishing in troubled waters for a kirk, goes against my grain. Besides, I have not the art of baiting the hook—I always put the wrong fly on.'

'Nor the patience of the true angler,' she rejoined.

'I am like the impotent man,' he continued; 'I have no one, when the water is troubled, to put me into the pool; but while I am coming another steppeth down before me. I made up my mind that if I failed to get this vacancy, it would be my last attempt, and that I should leave the ministry, emigrate to Canada, and go in for farming.'

'A congregation of cabbage-heads would certainly be more amenable.' Then, noting the gravity of his expression, she added, 'But really, Hector, you should not be turned aside from your calling by one man, even though he be a sergeant.'

'It is the doctrine, not the man, that is the rock. About him I suppose I might find some bit that was human; about it there is none. No; I have decided to make Balnacroy the test case. Their decision has meant more to me than the loss of a kirk. It is the forfeiting of a profession—nay, perhaps even a greater sacrifice, the surrender of a wife.'

His voice assumed almost tragic tones, and Elsie Smeaton felt their chill.

'I am giving up the prospects of a home,' he continued, 'and have nothing to offer you. It might take years for me, without capital, to provide a suitable home in the West. It is not fair to ask you to wait. I have come to release you, Elsie, not because my love has changed, but'—

'Because an old fossil blocks the way,' she interrupted. 'I should use a little dynamite on him first, and blast the obstruction out of the path before I'd own myself beaten.'

'I wish you would supply me, then, with the dynamite. I know of none powerful enough to have any effect on Sergeant M'Luskie. As long as he lives he will be pope in the parish of Balnacroy, and woe to the heretic who has incurred his ban!'

At that moment a newsboy dashed along the street, crying in husky, excited tones, 'Ultimatum to Germany. War inevitable.' It was 4th August 1914.

The Reverend Hector ran to the window and stood silently, gravely, looking out on the rippling waters of the Ness. 'War has been declared against Germany,' he said at last in a voice struggling with deep emotion. 'This is going to be a very serious matter, Elsie; it will mean the calling up of every man to fight.'

'Then the old sergeant will have to go too, and that will get him out of the way, and give him something to fight against, since he's never happy unless he's in the thick of it. Perhaps,

when he is gone, Balnacroy will call you, after all.'

'No, that cannot be.'

'Why?'

'Because I shall have gone too,' said the probationer as he rose and, with a face set with a new-born resolution, moved towards the door.

III.

'I am finished, sergeant. They have got me this time.'

The words came in broken syllables. The major who spoke had fallen to the bottom of the trench at the feet of Sergeant M'Luskie.

'Dinna say that, sir; we may patch ye up a' richt,' was the sergeant's response as he bent over his fallen officer.

'No—M'Luskie—this time it's—It. But quick, kneel down beside me so that you can hear. I have a lot—to tell you—and my strength is going quickly. I feel a dimness. All the officers are knocked out now. You are senior N.C.O., and—and—must take command of what is left of the battalion.'

'A' richt, sir.'

'The orders are, sergeant, we must stick to our post—to—to—the last man. That cannot be very long—unless help comes. I fear they have forgotten where we are. Perhaps they have despatched a message, and the bearer has not got through—for we are surrounded now. Our ammunition is running out. You must send a messenger back to headquarters telling them we cannot hold out much longer. Pick the best man you have got—for the safety of the battalion depends on his success. If he fails to get through, then we are lost. Meantime our instructions are to stay here. You are the right man, sergeant, for the job.'

A smile for the moment softened the drawn features. The major had had many occasions in the past for noting the stubbornness of M'Luskie.

'Ye can trust me, sir; I'll no budge. If thae Boches pass here, it'll be ower my deid body.'

'That's the spirit, sergeant. Work the men up to it—not that they need it. They have done wonders—poor fellows! I am sorry not to see you through with it. But I know you will stick it to the last, sergeant—for the sake of the dear old regiment—and the grand old flag.'

The speaker's head fell back, the eyes glazed, and Sergeant M'Luskie was left first in command.

He rose to his feet and looked round. There might have been the suspicion of a dimness in his eyes, but otherwise he was as calm and unmoved as when on parade. A whisper passed along the trench that M'Luskie was in command, and somehow it brought confidence into the men's hearts. He was a born leader of men when courage rather than tact was demanded; for the tight corner M'Luskie was the man.

It was growing quite dark now, and the sighing of the wind in the neighbouring pines formed an undertone to the increasing whistling and bursting of shrapnel. Batteries roared, and all along the horizon shells spluttered in splashes of angry red. Rocket after rocket flamed into the sky, describing gleaming arcs in the bitter wind of the darkness. Searchlights swept in ghostly sheets across the fields. Here, there, almost everywhere, the undulating crackle of musketry, like furze ablaze in a high wind, alternated with the banging of the machine-guns, long-drawn and regular, like the thud of a distant train. The whole landscape was populous with sound.

M'Luskie, who was a widower, had one son, John, his father's idol. John inherited the good points of his parent, with the failings toned down. For a few moments the sergeant stood rubbing his chin in thought. The whisper of his dead officer still echoed in his ears, 'Pick the best man.' To M'Luskie, the best man in the company was his own son John. It was a terrible sacrifice to risk the life of the one he so dearly loved. The temptation to send another was not silent—some other father's boy would do as well. No, not so well! He knew John through and through—his resource, his courage, his unflinching loyalty to duty. John could go to his death with a smile on his face if he was ordered. If there was a chance of getting through with a message, he could rely on John's quickness to seize it.

The sergeant smothered something in his breast, and turned down the trench, the stern mask of battle once more upon his features.

'John,' he said to a young fellow caked with mud, who welcomed him with a smile, 'I hae an important task for ye. We're rinnin' short o' ammunition, especially bombs, an' ye maun gang back to heidquarters, an' tell them that we canna haud on much langer unless they send up reinforcements an' supplies. It's a risky business, laddie, for the enemy's a' roond us noo; but keep yer heid, as I am sure ye wull, an' remember the fate o' the battalion is dependin' on ye. When ye get in, tell them to flash three lights agin the clouds, an' I'll tak' that as a signal that help is comin', an' that'll gie us speerit to staund oor ground. Noo, aff wi' ye as fast as ye can gang.'

The lad obeyed at once, and climbing over the parapots, was soon lost in the shadows. The sergeant walked slowly along the trench to speak a word of cheer and prepare the men for what all felt was coming. They had beaten off successive waves of attack, each fiercer and more determined than the one before. The present lull had been the longest, and that was ominous. The enemy was preparing to make his biggest effort. If only the delay was prolonged, the sergeant hoped that the relief might arrive in time to save the position.

IV.

As the minutes dragged into hours M'Luskie scanned with feverish impatience the dark canopy of cloud. At last across their background shone three flashes, the signal of coming help.

'It's a' richt, boys; the laddie has gotten through. They ken oor need noo, an' reinforcements'll sune be here, sae we maun haud oot,' said the sergeant, and his words brought fresh hope. Then suddenly isolated shots rang out near at hand. The outposts were giving their warning with their last breath, and soon, in the dim light of dawn, a dense gray wall emerged as the ranks of the enemy stumbled forward over the batter of sodden fields. As they advanced there rose the throbbing lilt of '*Die Wacht am Rhein*.'

Then the trenches leapt into a flame of fire, and the sheet of lead carved its way through the dense columns. It ripped their formation to tatters, but failed to stop the momentum of that oncoming host, whose numbers were melting on the ground as others behind closed up and shoved forward.

'Noo, men, ready wi' the bayonet, an' drive it hame!' shouted the sergeant, as he planted himself more firmly in the soup of water and mud that soaked his legs to the knees. If M'Luskie was a terror in the kirk-session of his native parish, now the fierceness of his glance was multiplied a hundredfold. Yet, if one could have analysed his feelings that moment, there would have been astonishment at the exultant joy that thrilled his soul. In church-court or trench M'Luskie was the same—a fighter, and a stubborn one at that. Once he took up a position in debate or battle, he stood immovable. His example steadied the men. All knew that so long as the sergeant's eye was on them there could be no retreating.

The singing ranks steadily neared; only a few yards separated them from the trenches.

'Gie them the last unce o' lead ye hae,' roared M'Luskie, and his voice had the note of thunder in it. He had glanced towards the communication-trench, but there were still no signs of the relieving force. He knew that it was only a matter of minutes now, and if reinforcements did not arrive, the enemy's wave must sweep over them.

The rifles, almost too hot to hold, volleyed their last challenge. The gray line swayed backward and forward, and half of it tumbled to the ground; but the reserves from behind pushed forward. They seemed endless, and soon there were more Germans than British bullets, and the great mass came tumbling into the trenches. The scene was terrifying. The cries of the wounded, the shouts of the defenders, the yells of the assailants blended into one awful din. Above all could be heard the sergeant's stentorian voice, 'Dinna gie wey, lads! Dinna gie wey!'

Thrawn to the last, M'Luskie refused to move even though four big Germans jumped into the trench beside him. His eyes flashed not merely the glare but the stealth of the tiger. He was quick to note every movement of that swaying mass, every glint of uplifted steel. Yet, as he had only one pair of arms and one weapon, he could not ward off every blow. His bayonet had got home on one of his assailants, but this left him at the mercy of the others, and he realised that his hour had come, when suddenly a young officer sprang between him and his foes, and with his revolver laid them out—not, however, before a bayonet had pierced the sergeant's side.

For a few seconds the issue of the attack was uncertain; but the young lieutenant had been the leader of the relieving force, and as the reinforcements poured in, the tide turned. The Germans, realising that they had done their worst and failed, reeled, and soon were hurled back on the corpse-strewn path they had come.

The young officer stooped to lift the sergeant, then started as he recognised him. The last time he had seen that face was when he had looked at its dour, stubborn, disapproving features from the pulpit of Balnacroy.

'Sergeant M'Luskie, I hope you are not badly wounded?' he said.

The Highlander looked in astonishment at his rescuer. It was the Rev. Hector Macleod, though his blood-stained tunic and smoking revolver were a strange contrast to the Geneva gown in which he had last seen him robed.

'Mister Macleod! Weel, I'm richt gied tae see ye. Na, I dinna think I'm ower badly hurt. That Boche, ye killed wud hae had me in the vitals if ye hadna got him i' the nick o' time. He's missed the hairt, an' I'm thinkin' it's but a skin-wound.'

'Here are some ambulance-men; they will tie you up. I shall see you later,' replied the lieutenant as he hurried on.

V.

When dawn had broken and the sun was shedding its light on that scene of slaughter, and men, as if ashamed of their foul deeds in the darkness, were hiding from its rays, the guns died down, and a strange peace crept over the trenches. Macleod had time now to keep his promise, and he sought out the sergeant, who had his wound field-bandaged, and was waiting to be carried back to a dressing-station.

'Well, sergeant, I am glad to see you looking better. Everybody is speaking of the way you held on. It was simply splendid,' remarked the lieutenant.

'We'd hae been wiped oot had ye no' arrived when ye did,' replied M'Luskie modestly.

'And we should never have come had you not sent your son to ask for help. Do you know, sergeant, I see in this an illustration of

a great theological problem that has often worried us. Had you not made an effort to help yourselves, and sent your son with that message, you would have been left to your fate. You did not act on your theological dogma of merely standing still and saying that you had nothing to do with your own deliverance, and if your number was up—well, that was an end of it. That is fatalism; but when it came to a working creed, you scrapped it. You made the biggest and wisest effort possible to save yourselves. I know what it cost you to send your son on that perilous errand, but it was either that or surrender to the enemy. Sergeant, you are a better soldier than a theologian, though perhaps the folk in Balnacroy will not agree with me, for you are one of its "men." You are famed as a pillar of the kirk; but the Rev. Hamish Mackintosh's doctrine is no good when it comes to a tight corner.'

'Mon, that's a new licht on the subject,' responded the sergeant slowly. 'I see yer point fine. If I had waited for help to come o' its ain accord, we wud hae been wiped oot. Ay, ye're richt; it cost me an anxious hairt to send John wi' the despatch, but I kenned that he was the best mon for the errand.'

'You showed your wisdom in not entrusting it to less competent hands,' interrupted Macleod.

'That's it; the maitter was ower serious for onythin' except the utmaist effort we cud mak' regairdless o' the sacrifice. Ye're richt, an' ye hae got yer sermon hame this time. There's a place, efter a', for mon's free-wull, though the Reverend Hamish didna seem to see it. I'm gaun to send a message the nicht tae Balnacroy sayin' that I am wullin' to sign yer call.'

'It will make one heart happy, I know,' replied the officer, with a smile—'that of a young lady whose ambition it is to clear away the nettles and the thistles round the manse of Balnacroy.'

IN MEMORY.

(D. S. M.)

THE world is poorer now he's gone;
We ill can spare—to-day—
Such never-failing kindness,
Shown in that simple way.

To reconstruct a shattered earth
We puzzle and we plan;
But the Golden Age's architect's
The good Samaritan.

His purpose single and sincere;
(Not all can reach that fame!)
A fragrance sweet will linger long
For this around his name.

My Yarrow! When to Border hearts
You tell your wistful tale,
Ah, keep his gentle memory green
In his beloved Vale.

MARY ADAMSON.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

SUPPORTED by authority of the best, we shall advance a curious proposition in the matter of the progress of the aeroplane and of man flying in the air. It is that now and for the future the aeroplane in its progress may suffer from a want of imagination and confidence on the part of man, who has been venturously exploiting it. Poor proposition that may be deemed when the short, tense, and tremendous story of the aeroplane seems now to have been one of the exertion of unprecedented imagination and confidence. For five years imagination overleaped itself by day and night; people stood marvelling in awe of their own species thus so fine. But did imagination ever once quite catch up with the fresh and obvious possibilities that were set forth at each new advance? The faster imagination ran, the farther did the grand horizon recede. The area of possibility was unbounded. For that it was the more fascinating. Here was a work with which we might continue for ever, finding it more enthralling all the time. Only imagination was wanted for stimulus, that imagination that lifts us free from all the littlenesses of the past, and is the medium by which souls are transported to their heaven. Imagination indeed, as we all perceive, is as the soul of man. It worked well enough during the five years' special demand and strain; but afterwards there was apparent a certain reaction, not so much among the flying-men as among those who contemplated them, their efforts, and many matters that concerned them. The aeroplane had done its duty, and there was some kind of a disposition in minds of moderate understanding and small capacity in fancy to dismiss it, reverting to an old belief that, after all, the aeroplane could scarcely be more than a toy; that all the time it had the terrible invincible force of gravity to contend with, and that this gravity must always prevail. That is a peculiar idea, and it is strange how even now it seems to rule the thoughts and the instincts of many persons in contemplating the future of the aeroplane.

* * *

The war being over and no menace from enemies among the clouds now being apprehended, there is a disposition to thank the aeroplane and turn the attention in considerations of practicable

and profitable flight exclusively to dirigible balloons, large gas-bags of improved construction, most ingenious things in their way, but, after all, not more than improvements upon apparatus employed by our distant ancestors, the principles being identical. Commercial and other people murmur that for the future the balloons will have it. It matters not that there is a daily aerial service to Paris and other places; that the aeroplanes are on the track of Puck in his girdling of the earth; that for a sudden, quick, and sure journey under almost any conditions and at the maximum speed attainable by man the aeroplane is the most readily available and certain thing; and that never in any test or emergency to which it has been submitted has it failed. For all this and so much more, a section of the community that is much concerned turns now away from the aeroplane, agreeing that it was excellent, most interesting, remarkable, but that for the steady and progressive jog of commerce in times of peace the air must be given to dirigible balloons. They are bigger, safer, steadier, and so forth, it is said. In this one perceives a certain reaction after the straining of imagination in the war. There is a temporary tendency in man after one step forward to make two backward if he may, and entrench himself again in the old stabilities of antiquity. But in the end the progressive instinct in man prevails. We shall survive this affection for the dirigible, the gas-bag, as against the flying-machine. It is possible that some commercial potentates will come to comprehend the considerable truth that all birds, from the lordly eagle to the lively tom-tit, are also heavier than air, even as the aeroplanes that soar above them, and after the almost superstitious faith in the omnipotence of gravity of which we have been witnesses, a realisation of this circumstance might cause a flutter at directors' meetings. They may not as yet have apprehended that the first transportation of humanity ever effected in the air was by the eagles when they carried off children to their nests. Such eagles concerned themselves not with gravity. If, then, progress is desirable, and we would progress in flight, there should be a return to confidence without reserve in the aeroplane for every aerial purpose. It is a suggestion made with the encouragement of

those who, in the pursuit of progress, feel themselves to be much concerned.

* * *

The other day this affair was discussed in a corner of London with an eminent airman with whom we who write first flew the air ourselves, upon which occasion, in meditation at a height of some thousand feet, we formed convictions upon this and kindred matters. It seems better, perhaps, to judge upon such affairs at a height of half a mile or so, on the upper side of clouds, than in a conveniently furnished apartment on the most positive and solid earth. He was the man who first flew across the Atlantic Ocean, Captain Sir John Alcock, who, alas! not many weeks later, was to meet so untimely a fate in France. On this afternoon it was proposed that, with a certain end in view, we should go flying. He was telling us something of the possibilities as he saw them, and speaking of the need for removing certain miscomprehensions upon the management of aeroplanes. Skill and nerve are demanded for most undertakings with which progress is concerned, and they are needed by aviators; yet the management of these machines by one who is fitted for the task is not such a very difficult or fearsome business. I put it to my friend: how long a period is needed to teach a fellow knowing nothing of the aeroplane, its ways and tricks, to manage it, control it, fly up in the air with it far away alone? That is a point upon which many persons may have cogitated, and here is the answer by what was clearly an authority of the best. The answer was: four or five hours. This also, in a certain sense, indicates the maximum period. Sir John Alcock declared that a person who had the instinct for flight—and it is not rare—should, by the exertion of his intelligence, his progressive faculties, and such venturesomeness and resource as are demanded, learn the business in four or five lessons of an hour each, all of which might be taken in a day. At the end of this series he should be in a position, and have sufficient knowledge and confidence, to take his pilot's seat in an aeroplane alone, and set the apparatus to the air. He should be capable of making it lift from the ground and go forward and balance in the air—and there you are! The rest is a matter of practice and confidence. It is not sufficiently appreciated that flying at a hundred miles an hour at a height of five thousand feet is in essentials not more difficult than mere buzzing just above the surface of the earth—that, indeed, in the matter of confidence and safety it is easier. Our good authority put the case for the day's complete tuition more definitely even than it is here expressed, for he urged that if a pupil could not thus in such few hours learn to control the aeroplane, and himself alone control it in the air, then he was no Icarus, nor ever would be, but should move always on solid earth afoot or awheel.

The late Captain Sir John Alcock was much of an idealist, sparkled with imagination, and believed in the aeroplane as against the dirigible. Particularly he insisted upon the necessity of applying imagination to the grand purpose of the navigation of the air, as it was applied in war; for progress to a splendid and most commercially practical aviation could only be attained by such imagination accompanied by its indispensable ally, faith. He seemed to lament the new scepticism that has arisen concerning the aeroplanes, now that they have completed so splendidly their war work. He suggested to me that this injurious scepticism results from exhaustion of such imagination as is essential in all affairs of flying, and a certain reaction after the war. It was because imagination, and demands arising from it, were always at highest during the war that achievement kept splendid pace, and one day's success was extended on the next. Development has perhaps never been lashed to such a furious pace before, and that is why the aeroplane, which in 1914 fluttered in the wind and often fell, is, in his opinion, a sound commercial proposition in 1920. Imagination has been effective. If imagination also is now to be demobilised and we are to set ourselves to ponder upon limitations and impossibilities as not hitherto, would it not be a sorrowful and an un-British thing? So the chance should be dismissed. 'It is by optimism that the present great success has been achieved, and only by optimism can we advance,' he said. 'The era in aviation now opening is the commercial era. Possibilities and, indeed, the almost indeterminate probabilities are boundless, not merely in the spectacular but in the practical and commercial way; but, as I urge, they must be contemplated with imagination and with reasonable optimism. It is of no advantage in contemplation to murmur that this or that has indeed been done, *but*—The consideration of the future of aviation is not an affair in which "buts" should be encouraged to take too formidable a part. In this reaction where that homage is again being paid to the lighter-than-air, which stands for a more ingenuity rather than imagination. At the moment the aeroplane has failed that now, in times of peace, new doubts should arise about it, but they are as nothing after all. Surely it is waiting for a new triumph by our people. For my own part in this matter I am a practical optimist. I believe in the future of aviation, the aeroplane which is heavier than air—practically, every way, but above all commercially, and that is the thing of the greatest importance at the present time. One of the chief faiths is that commercial aviation may be called, the doing of business: the conveyance of passengers and goods, nationally and transatlantically, will be

established in five years from the present time. Doubts and hesitations must give way before proofs, and these will be continuously yielded in abundance. In my opinion, the great machine of the future will not be like anything we have seen so far. It will be bigger, stronger and more stable, and far more powerful than anything we have at the present day. This machine will enable Britain to trade with the United States, and will carry passengers from one to the other on a regular service in a few hours. Positively there should be such a regular passenger service, the journey accomplished within the day, in not more than five years from now. The machine will be, I think, a large flying-boat with engines of about 5000 horse-power. Imagination must work hard upon the idea, and it is doing so. It is not a case only of imagination, idea, and faith, and much present speculation. The project has been entered upon. The designing of this machine has been begun. It will soon be constructed. The necessary improvements will be added as they are conceived, and in five years there should be a great consummation of the idea.'

* * *

On this occasion of confidence and contemplation there was some opportunity for talk with a fine adventurer upon his secrets, or at least his private judgments. This, like other heroes, was a man whose modesty ran to the point of vice, in that it might conceivably militate in some measure against worldly advancement. Sir John Alcock had ideals, and with them enthusiasm, and, like his tribe, he did not commonly mix considerations of worldly reward with the enterprises of his spirit. There are the thought and the hope, the intention and the action, the full cycle of an idealist's achievement. The reward, if any, comes afterwards, and concerns not the splendid drama. Sir John was a Lancastrian, frank in feature, sincere in heart. Business men (and it is strange to see how often the commercial world lags sadly in imagination and enterprise, and sticks to old convention as to a safe financial rock) might complain that too often a hero is not in their own or the City sense a very practical man. They murmur that he is fanciful, perhaps, and does not present a practical 'proposition,' something that will really work and, in consequence, has money in it, a sound (even if a somewhat speculative) 'proposition.' The City constantly seeks a 'proposition,' and much as it would scorn the accusation, it loses thousands because it is old-fashioned. It is true that some commercial men, most commendable pioneers, are backing the aeroplane and being well justified, but Gog and Magog sometimes seem to fancy that the dirigible bag of gas is the more gilt-edged thing. So these people of Throgmorton Street, of Cornhill, and Lothbury regard heroes kindly and with patronage as idols

for banquets, but not always as propounders of those practical 'propositions' of which they are ever in quest. This man who first flew the Atlantic Ocean made a confession to me of what in his serious and carefully considered judgment had been the tensest moment of his life, and, be it remembered, this was one who in early youth saw the first planes that went his Lancashire way, and, soon as could be, himself took to flying, and in the war did marvellous things. A scout at the Mudros base, he set up a record for long-distance bombing operations, made flights that lasted for eight hours or more, dropped bombs upon Constantinople, Adrianople, and the Dardanelles, and sent seven enemy planes below. He and his men, machines being scarce, showed how practical they were by building one for this scouting business at Mudros. Great adventures were his lot. Once he and his associates had to descend into the sea off Suvla Bay. They hung on to their wreck, Turks firing upon them, struck out for the land, swimming in the darkness towards the rocks, where they hid; but in the end they had to surrender. Here was some very practical business, such as won a D.S.C. But what he told me of his selected moment was more impressive. One who has known loneliness in superb intensity has wondered since upon the utmost possibility in the way of a different and more desolate human loneliness, and though Alcock had with him his faithful Brown, he seems to have gained this distinction and secured it for himself. For, difficult as the contemplation of extreme possibility in lonely isolation may be, we may ask if it is conceivable that ever there could be a more really terrible loneliness than for a human body and soul to be wrapped in a fog, nothing to be seen up or down, away at a height of many thousand feet, above the clouds and among, as one would say, the invisible stars, unaware of position or direction of movement, knowing only that somewhere below was the Atlantic Ocean, and somewhere above what we call the heavens. Literally, absolutely, here were two units lost in space, and space befogged at that.

* * *

He who was most concerned told me that soon after leaving the other side of the ocean, on his great attempt, his wireless apparatus having almost immediately given out, he struck a Newfoundland fog, and for seven hours sped along at two miles in the minute, seeing neither sea nor sky. This was as a gentle introduction to the depths of solitude. A little later the fog became universal, superseding the small cloud that had accompanied it, and the machine was wrapped in it. Then for half-an-hour the atmosphere cleared, and navigator Brown busied himself with the only things in the universe that were of any use to them, being the Pole-star, Vega, and the moon, by which they fixed their

position and continued hopefully on. The fog again closed round them, and shut them out from everything. Some time after this their air-speed indicator failed, the machine jolted and shook in a new uncertainty, and they lost their course. They knew not where they were, and in the fog had no means of finding out—no Vega, no moon, no Pole-star, no horizon. The machine, turned crazy in the dilemma, rocked and began to spin. It spun, as down and down it descended from a height of four thousand feet. Now, that was a proceeding that was sure of one ending if it continued, an ending such as would have prevented any telling of this story. Captain Alcock held to a full realisation of the circumstances and the situation. He told me that amid his waiting and wonderment as to whether in this strange and most perilous descent the fog would at some level clear away sufficiently to give him the momentary glimpse of the horizon that would be enough to locate his altitude—not merely his position, but what we may call his angle to the earth, which, in the circumstances, he did not know—the idea for a part of a moment did enter his active mind that those might very well be the last beatings of his heart. If the fog reached to the level of the sea, they would be. But when, the machine still spinning, the atmosphere became clear, and he saw he was a matter of but fifty feet above the waves, the sight of the sea and the horizon was enough for the instant action of a very practical man—the spinning and the falling were corrected, the course was set again, back they climbed to seven thousand feet, and though there were still fog and clouds, though hail and sleet whipped them for six or seven hours, on they went to Ireland, and at last, after nearly sixteen hours from the start, they suddenly saw below them a tiny glow of green. That was land, the land of an island just off Ireland. So much for idealism and practice. A 'proposition' had been realised.

* * *

There has been much written and spoken and thought of what we call the romance of the air. But this is a business that begins with romance and so continues, with no interruption. Each detail of human flight is of necessity what we call romantic. But let us glance, for a fit conclusion perhaps, at a strange incident of which this famous and much-lamented adventurer informed us. Out fighting in the air somewhere near the Dardanelles, it came about that with difficulty he dismissed a German flier, who toppled broken to the sea. Some time later that German airman's propeller was picked up from the sea with what was meant to be a last message of his written big upon one of the propeller-blades. The message was addressed to a lady in Bulgaria, and was transmitted to her. It transpired later that the airman must have been rescued after all, but, luck being against him, he was killed at a

later period of the war. Now, the lady discovered the manner and the circumstances in which her friend—or perhaps her lover—was tumbled down into that eastern sea where, in his supreme plight, he had the consideration to write to her—in the absence of a pad of paper—on the floating propeller. He having later gone to his final doom, the lady was moved now to write to his quondam conqueror, Alcock, which she did accordingly, and he received the letter—strangest epistle surely that ever airman had. She wrote in English, and she desired to tell him all about herself, and longed to know something of him in turn. She apologised for having taken the liberty, as she said, of writing to him without being known to him, but she would 'introduce herself.' She was the young lady, so she wrote, to whom the German pilot, Müller, whom he had brought down two years previously, had written last greetings on the propeller of the wrecked seaplane. She had received a copy of an English newspaper with a picture of the said propeller, and another of Captain Alcock who had done the deed. Thus she knew that he was the man. Now listen to the continuation of this letter: 'I was very curious to know something about you, and Captain Wildish and Commander Greig, who know you very well, told me what a good flier you are, and that just recently you gained the prize in a concourse for a flight over the ocean. I congratulate you for that. My friend Müller was a very good pilot; he was one of the best, and I see that he has had a worthy ending. More than that, you must have excelled him to have beaten him down. I myself have never been in an aeroplane, and don't know what the sensations may be when one is so high up, but there must be something that makes you risk your life so readily. You really must feel great, having conquered the space. I began by introducing myself, and I must say something more to let you have a complete picture. I am a Bulgarian, and am a graduate of an American college; I lived several years among English and American people, and learned to love your language and literature. Last winter we had a great many English people here, and I had a chance to practise the language, and enjoyed it greatly. I shall be immensely pleased if you send me a good photograph of yourself; and if you add some snapshots of your seaplane too, I shall enjoy them none the less, and with the picture in the paper I shall highly treasure them. I shall not say how I would wish to possess the famous propeller, but rightly it belongs to you. It is your trophy, for it is you have risked your life.' She believed he would answer her 'small request,' and she sent him her 'very best wishes' and was his 'sincerely.' Such was the curious letter that Straoka Ilievna sent from her abode at Varna in Bulgaria, and it seems to add another item to the very perplexing feminine puzzle.

THE PARTS MEN PLAY.

CHAPTER VII.—continued.

VII.

THE noise of the party in the *cabinet particulier* had been growing apace with the reinforcement of champagne-bottles. The strident laughter of the women dominated the lower level of men's voices, and there was a constant clinking of glasses, punctuated by the occasional drawing of a cork, which always whipped the gaiety to a feverish pitch. Monsieur Beauchamp rubbed his hands rather anxiously. He would have preferred a little more intrigue and not quite so much noise. But, then, was it not a testimony to his wine?—and certainly there would be an excellent bill.

One of the men in the party called on some one for a song. There was a hammering on the table, a promise of a kiss in a girl's voice that trailed off into a tipsy giggle, the sound of shuffling chairs and accompanying hilarity as the singer was apparently hoisted on to the table. There came a crash of breaking glass as his foot collided with some dinner-things.

Monsieur Beauchamp winced, but consoled himself with the reflection that he could charge what he wished for the damage. The voices were hushed at the order of the singer, who was trying to enunciate the title of his song.

'I shall shing,' he said, with considerable difficulty, "'Moon, Moon, Boo—(hic)—Booful Moon," composed by myself at the early age of sheven months. It ish very pash—pashesh—it ish very shad, so, if ye have tearsh, pre—(hic)—pare to shed 'em now.'

There was loud applause, which the singer interrupted by commencing to sing in a bass voice that broke into falsetto with such frequency that it was difficult to tell which voice was the natural one. He started off the verse very stoutly, but was growing rather maudlin, when, reaching the chorus, he seemed to take on a new lease of vitality and bellowed quite lustily:

'Moon, Moon, boo-oo-oo-ful Moon,
Shining resplendantly, radiantan' tenderly;
Moon, Moon, boo-oo—(hic)—booful Moon—
Tell her I shy for her, tell her I die for her,
Booful, BOO-OO-oo-ful Moon.

'Now then, fellow Athenians, chorush, chorush!' With an indescribable medley of discordant howling the party broke into a series of 'Moon, Moon, boo-oo-oo-ful Moon,' which came to an abrupt ending as the singer fell back, apparently unconscious, in the arms of his friends. There was a murmuring of voices, and a waiter was sent for some water to revive the young man.

Considerably disgusted at the ending to the incident, Selwyn, who had turned to look towards

the *cabinet particulier*, once more sought his companion's eyes.

Her face was white; there was not a vestige of colour in the cheeks.

'Miss Durwent,' he gasped, 'you are not well.'

'I am quite well,' she answered quickly, but her voice was weak and quivering. 'I—I thought I recognised the singer's voice. That was all.'

The curtain of the *cabinet particulier* was drawn aside, and two youths in evening-dress emerged, supporting between them the dishevelled singer, who was miserably drunk, and whose hat almost completely obscured his right eye. They were followed by three girls with untidy hair, whose flushed, rouged faces had been made grotesque by clumsy dabs of powder.

The singer's hat fell off, and Monsieur Beauchamp, who was hovering about with the bill, had just stooped to recover it, when Selwyn heard a suppressed cry of pain from Elise Durwent. Thrusting her chair away from her, she made for the emerging party and halted them at the top of the stairway.

'Dick!' she said breathlessly. 'Dick!'

The drunken youth raised his heavy eyelids and looked with bewildered eyes at his sister. One of the girls tried to laugh, but there was something in the insane lightness of his eyes and the agony of hers that stifled the ribaldry in its birth. His face was as pale as hers, a pallor that was accentuated by dark hair, matted impotently over his forehead. But there was a careless, debonair charm about the fellow that made him stand out apart from the other revellers.

'Hello, sis!' he muttered, trying to pull himself together. 'My li'l sister Elise—friends of mine here—forget their names, but jolly good fellows—and ladies too; nice li'l ladies'—

'Bravo, Durwent!' cried one of his friends, emitting a dismal howl of encouragement.

'Dick! Boy-blue!' The breathy intensity of her voice seemed to rouse some latent manhood in her brother. He stiffened his shoulders and threw off his two supporting friends—a manœuvre which enabled Monsieur Beauchamp to present his trifling bill to the more sober of the two. 'Why aren't you at Cambridge?'

'Advice of consul,' he muttered. 'Refushe to answer.' He shook his head solemnly from side to side.

With a swift gesture she turned to the American. 'This is my brother,' she said, 'and I know where his rooms are in town. If you will bring my cloak, I'll get him to my car and take him home.'

Selwyn nodded his understanding. He hardly knew what words he could speak that might not hurt her.

'Listen, Dick dear,' she said, stepping very close to him and taking his hand in hers. 'Please don't say anything. Just come with me, and I'll take you to your rooms.'

Through the befuddled wits of the young fellow came the sound of the voice that had dominated his childhood. He smelt the freshness of the long grass in the Roselawn meadows; with his disordered imagination he heard again the clattering of horses' hoofs on the country-road, and he saw his sister with her copper-tinted hair flung to the breeze. With a look of mixed wonder and pain in the yellowish blue of his eyes, he allowed her to take his arm, and together they went slowly downstairs and through the throng of diners craning their necks to see, while the party he had left emitted snorts and howls of contempt.

Selwyn reached the door in time to help the drunken youth into the car, and then placed the cloak about Elise's shoulders. She put out her hand.

'Good-night,' she said.

'But you will permit me to come?' he said. 'I could be of assistance.'

'No—no,' she said tensely, 'please—I want to be alone with him. Have no fear, Mr Selwyn. Poor old Dick would do anything for me.'

He held her hand in his. 'Miss Durwent,' he said, 'I cannot express what I mean. But if this makes any difference at all, it is only that I admire you infinitely more for'—

'No—please—please say nothing more,' she cried with a sound of pain in her voice.

'But may I come and see you again?'

She withdrew her hand and pressed it against her brow.

'Yes. I—I don't know. Good-night. Please don't say any more.' The words ended in a choking, tearless sob. She stepped into the car, and with no further sign to him threw in the clutch and started away.

Huddled in the corner, his pale face glistening in the lamplight of the street, the Honourable Richard Durwent lay in a drunken sleep.

(Continued on page 150.)

ANDEAN GOLD.

By A. R. GROVES.

THERE is only one area in the world where creatures resembling sheep have been used in connection with gold-mining, and that is among the Andean sierras in Peru, Bolivia, and the Argentine provinces of Jujuy, Catamarca, and La Rioja. In this wild and desolate region of the *quebradas* and the *puna*, so sparsely inhabited in parts that one may travel a whole day and see no more of human habitation than one or two wretched low structures of mud and grass that in the distance look like boulders, the llama furnishes food and clothing to the miners, and has from time immemorial been used by them as a beast of burden. It will carry about one hundred-weight twelve miles a day, along the merest shreds of tracks cut into the face of tremendous precipices. Its broad back, covered with thick wool, bears the burden with the minimum of packing; its spongy hoof, supplemented by curious claws, fits it to cross securely the icy surfaces abounding in the high regions where it exists; and, like the camel—with which it has considerable affinity otherwise—it can go for lengthy periods without water. That the original Spanish conquerors of South America were too proud to utilise such a homely animal, as they found the Incas doing, was one reason why they failed to develop the richest of the gold-mines, for the sake of whose produce they subdued the continent. The earliest invaders, in default of horses, did attempt to ride llamas; but the result was frequently disastrous, for the animals have a

habit, when wearied, of turning round and expectorating at their riders. To be thus spat upon by sheep proved too much for the Castilian pride of the mail-clad gold-seekers, who therefore left the llamas alone as soon as mules could be imported in sufficient numbers to supersede them. The natives, however, continued to use them, as they do to this day.

But there are recesses in the Andes where even the hardest of mules cannot penetrate, and it appears to have been from these that the original inhabitants procured the immense supplies of the precious metal which the *conquistadores* found in their possession—supplies so great that, as Prescott puts it, 'gold seemed to be the only thing in Cuzco that was not wealth.' Except coins, everything down to the commonest articles was made of it, and it is significant of the part that the llama played in its production that full-sized statues of these animals, in pure gold, were repeatedly discovered by the conquerors. Yet the Spaniards quite failed to trace the chief sources from which this enormous mass of treasure had been drawn. Even to this day they can only be surmised. Somewhere amongst these tremendous mountains goldfields must exist richer than any known to our generation; but even scientific prospecting—of which there has been much during recent years throughout this region—has been unable to rediscover them. There are romantic stories that the secret of their location exists among the descendants of the

ancient Inca families; otherwise they are as utterly lost to the world as though they had never existed.

Other deposits of lesser importance have, however, been discovered, and these, from the nature of the country, constitute most important mining propositions. To say nothing of Peru and Bolivia, whose mineral wealth has long been known, there are the extraordinary (though little-heard-of) possibilities of the north-west Argentine provinces. La Rioja alone is a veritable storehouse of minerals. Gold, silver, copper, and iron have all been found, and, to a limited extent, worked, as well as nickel, cobalt, chlorates, carbonates, sulphates, nitrates, rock-crystal, salt, and coal. Mr O'Driscoll some years ago, in a paper read before the Geographical Society, stated that 'there are enough mineral resources in the province of La Rioja to pay the whole foreign debt of the Republic without in any way exhausting the supply of minerals.' Catamarca, too, is a mineral-bearing province, though with other resources as well; and there is a goldfield of considerable extent in the arid plateau known as the Puna de Jujuy. Some of the mines here are 14,000 feet above sea-level, and all the gold-seekers suffer from mountain sickness until acclimatised. Many of these men are mere 'fossickers,' seeking fortune in the dry gullies, or over the arid, treeless plains with which the district abounds. Some deep sinkings have been made, but the remoteness of the locality has as yet been preclusive of any striking success as regards these. What is remarkable about this Puna field is the vivid colouring assumed by the gold-bearing rocks. Red, blue, and green in combination are common; and, besides these, all shades between them, as well as snow-white quartz and black basalt, are often present. This is, of course, indicative of the highly mineralised nature of the country, and it is doubtful whether any other goldfield in the world is so rainbow-hued. Farther to the south, near the province of San Luis, another field has been opened up in the sierras; but, although it is rich in silver and other metals, its gold contents are comparatively small. It is entirely a deep mining area—at least, in the sense that the deposits are seldom workable on the surface—and it has been severely handicapped by its long distance from the railway. The difficulty of

transport is, indeed, the drawback of all these Andean mines. When you have to bring produce down from a height almost equal to that of Mont Blanc, on llama or mule back by mountainous tracks, then carry it for days in a slow-moving wagon across practically roadless pampas, and afterwards pay heavy freight for hundreds of miles, it requires exceptionally rich ore to cover the costs involved.

Twentieth-century engineering has, however, tackled the problem with success in at least one instance, that of the mines of Famatina, near Chilecito, in the province of La Rioja. The deposits there, situated over 15,000 feet above the level of the sea, are exceptionally rich, not only in gold, but also in silver, copper, and iron. They are, of course, within the region of perpetual snow, and to work them by any of the ordinary means would be almost impossible. No road could be made to the spot, and any kind of animal transport, otherwise than in the most sporadic fashion, is out of the question. It appeared as though the problem could be solved only by a kind of flying-machine service, and something of the kind was, some ten years ago, actually constructed. It consists of a wire-rope railway, or gigantic endless rope, over twenty miles in length, the longest in the world, which stretches away from the Government railway at Chilecito, swings over some of the wildest country on earth, and climbs two miles almost perpendicularly up the Andes to the frigid height where the mineral is mined.

This wonderful aerial railway is literally suspended from mountain-top to mountain-top, some of the unsupported spans being from 600 to 800 yards wide across the most tremendous gulfs—the greatest, indeed, is more than half a mile across. By this weird arrangement men and material are borne upward to the workings, and the ore is sent down. The working of this aerial line is automatic. The cars leave the mine full, rush down at the rate of one a minute, or less, stop near the terminus to be weighed by mechanism, and empty themselves before starting to climb upwards again for another load. Some day, when the old Inca gold is at last revealed, it will doubtless be by some such machinery, instead of by the llama or the mule, that it will be made available for the world's service.

KING RUFUS'S LOVE AFFAIR.

By W. VICTOR COOK, Author of *Grey Fish*.

I.

THE abdication of a reigning monarch may seem a simple step to the vulgar, who in their lowly station have small conception of the problems of kingship. But to the monarch the

moment when he lays down his authority is apt to be fraught with grave embarrassment.

Rufus Jefferson was King of Horseshoe, and had been any time these forty years. You might not have taken him for a king if you had seen him sitting at the door of his wooden house on

the border of the creek, considering the complicated questions connected with his abdication. He did not wear a crown or go abroad in purple and fine linen, though he could well have afforded those symbols of royalty if his tastes had lain that way. Under the wide brim of his felt hat was a hawk-like old face, lit with steely-gleaming, deep-set blue eyes, and the lower half of his features was hid in a tangled gray beard. He wore a suit of stained corduroys and a pair of heavy laced boots, and as he sat and meditated he emitted clouds of pungent smoke from a pipeful of *kinickinick*, the dried bark of the weed beloved of Indians—which, by the way, is a luxury you would do well to avoid if any one should press it on you.

It was a noble prospect on which King Rufus gazed through the fumes of his *kinickinick*. Snow-capped peaks, gleaming against the blue, showed themselves between the gaps that opened among the mountain-masses; great dark blankets of pine-forest swathed the nearer slopes; dizzy cañons split the hills, cradling in their depths swift-rushing streams fed from the eternal snows. Right at his feet lay Horseshoe, his own domain, famous as the origin of the biggest nugget ever found in Montana.

Rufe, as his subjects called him for short—though not always to his face—had founded his kingdom in the long-ago, and seen it grow around him, and ruled it with a strong hand. His thoughts, wafted on the curling wisps of *kinickinick* smoke, went back to the old days when he had established his kingship. He remembered that first terrific journey of his, when, as a young trapper, he had crossed from Montana into Oregon with a saddle-horse and nine mules, loaded with all kinds of supplies, travelling through immense untracked forests, crossing three ranges of mountains and several big unbridged rivers, till on his return journey, after eighteen months of solitary wandering, he had struck the site of Horseshoe, on the western side of the great Continental Divide. There was no other white man in Horseshoe then, nor was there for sixteen years after Rufe settled himself on the creek, and with his unaided hands built himself a sawmill, and a reservoir half a mile long and a quarter of a mile wide, and sawed lumber, and hewed out a shaft. Everything about his mill was of timber except the saw; and he made a carriage for the logs, and everything else. He remembered the day when he broke his saw, and by his own efforts welded it again himself—a feat which many a good mechanic could not accomplish with all the appliances of civilisation to aid him—so that you could not tell where the welding was. At last other pioneers began to come to Horseshoe to mine for gold, but by that time Rufe had all the water rights, and leased them to the new-comers, and sold them lumber, and mined himself, and made a lot of money. The place had grown and

grown; and as it had grown, so had King Rufus's fortune, till he was one of the richest men in the State of Montana. And now Horseshoe was a town of several hundred inhabitants, and had its gambling-saloon and its dancing-hall, where doubtful characters congregated to collect their tithes of the miners' gold-dust; and there were four stores, and a stage station, which was also a public hotel. And every house in the place was built of wood which King Rufe had sold to the builders at a hundred dollars per thousand feet, and in every industry in the place King Rufe had his interest.

To every abdicating monarch the supreme problem of his position is the safe disposal of his plunder, and this it was that was knotting the frowning brows of King Rufus as he sat smoking before his timber palace. The almost illegible scrawl of 'R. Jefferson' had long been a power in the Montana State Bank at Helena, forty miles away across the mountains, but King Rufus maintained his own royal treasury also in his own capital. Just where it was none knew but himself, though many would have given a good sum to learn. Just how much it was, too, was unknown to any but Rufe himself; but he knew to an odd hundred dollars or so that in that safe and secret repository he had a store of nearly half a million in dust and nuggets. His problem was how to transfer that treasure from Horseshoe to the coffers of the State Bank without the risk—nay, the certainty—of a tragic interruption on the journey. Rufe was a dead-shot, and had never been known to shirk a scrap; but these qualities were common among his subjects, and his journeys to the state capital were too few and far between to be regarded as other than public events. And though the fact of his abdication must in due time become public property, he had no intention of advertising it beforehand.

The more Rufe meditated, the more difficult seemed the solution of his conundrum. Like many absolute monarchs, he knew he was not popular in his kingdom, and into every scheme he thought of for evading publicity in the conveyance of his gold a disagreeable vision intruded itself—the picture of a dishevelled old man lying dead at the bottom of a gully, somewhere along the forty-mile mountain-trail to Helena.

II.

Down the winding valley of the Horseshoe Creek the western sun slid behind a bluff, and the purple shadow of the mountain crept over the settlement. In sawmill and stampmill the sound of the day's business slowly died away, till the murmur of the rushing creek had things to itself. Still Rufe sat smoking and thinking.

'Gie's a licht, Rufe!'

With a deeper frown King Rufus looked up at the daring subject who thus familiarly broke

in upon his royal reverie. A tall, raw-boned young Scot, with gray smiling eyes, and a mop of fair hair innocent of any hat, stood before him, holding an unlighted briar in a big, toil-hardened hand.

Young Alan M'Leod, who had somehow drifted into the Great Divide from Perth—which he always called 'Pairth'—was one of the few men in his dominions for whom King Rufus had any kind of respect. He was a gay, unaffected lad. Rufe, who eschewed women as the plague, knew only one thing against him—that in the course of a mere three-months' residence in Horseshoe Alan had succeeded in winning the affections of Madge Tremaine, the dark-eyed daughter of Rufe's mill foreman, and the unchallenged beauty of the settlement. With a grunt, Rufe tossed his match-box to the young miner, who caught it neatly.

'When I was a young man,' said Rufe, 'we used to buy our own matches.'

'The wor-ld improves with keepin', Mr Jefferson,' said Alan, grinning cheerfully. 'Did ye never hear o' the Scot in the railway-train?'

'Guess I've heerd of Scots in every goldarned kind of place,' answered Rufe grimly. 'What about him?'

'There were three other guys in the compairtment, an' he asked each o' them in tur-rn if they wud kindly obleege him wi' a match. They a' said they hadna ane, so the Scottie pulled oot his box, an' said, "Aweel, I'll e'en hae to bur-rn ane o' my ain!" Say, Rufe!'

'What?'

'Have ye found the mother-lode?'

'What are you getting after?' Rufe spoke sharply. To strike the 'mother-lode,' that mythical origin from which the glacier-borne deposits of the precious metal are commonly reputed to come, is the prospector's dream.

M'Leod laughed, and having lit his pipe, uncereemoniously tossed back the match-box on to its owner's knees. 'Mon, ye were so preoccupied, I thocht ye micht hae struck it, an' be plottin' hoo to keep the secret frae the rest o' us.'

King Rufus took his pipe from his mouth, and, with his lips slightly parted, sat staring at M'Leod with such a fixity of expression on his lined face that the young man was startled.

'So long, Rufe. I'll gie ye ane o' ma matches next time I'm passin'!'

He was moving off, but the old man held up a detaining hand. His stare had given place to a cunning smile. 'Who told you Rufe Jefferson had found anything?' he drawled.

M'Leod was surprised at the sudden change of tone. 'I kind o' guessed it,' said he for want of a better retort.

'You're kind of quick at guessing, Alan,' said Rufe. 'Say, Alan, I've lived a longish time in this country, and I tell you it don't do to guess

too much around Horseshoe, Montana. It ain't healthy. You get me, lad?'

'I get you, Mr Jefferson,' said Alan, moving off. 'Mum's the wor-rd.'

III.

And yet 'mum' wasn't the word. Somehow it got about thereafter in Horseshoe that King Rufus had struck it rich. No one could quite trace the rumour to its origin, though it was currently reported to come from Tremaine, the sawmill foreman. Tremaine, indeed, on being sounded, admitted that he had heard something, but what it was that he had heard he would not particularise. It was observed that Mr Jefferson made sundry unobtrusive visits with a hand-drill to a certain gully in the vicinity over which he had rights, and the sound of blasting was heard in the gully.

Then one day it became suddenly known, on no less authority than that of Mr Jefferson himself, that Rufe had hit upon an unsuspected vein of rich auriferous quartz in the gully. Day after day the old man visited the site of his discovery, and day after day he brought back with him a grip full of quartz, which he piled outside his home.

He made no secret of his find. He was ready to show the quartz to all comers. He boasted royally of its exceptional quality, and vowed he would take an early opportunity to have it properly assayed. The claims of Rufus's quartz were publicly discussed at the saloon, in the dancing-hall, wherever the inhabitants of Horseshoe forgathered for business or pleasure.

And gradually, from being a nine-days' wonder, the thing became a public joke. For it was a community of miners, and many by now had seen and handled the wonderful ore, and one and all who had examined it declared unhesitatingly that the thing was a frost. There was gold in it, of course. There was gold in any amount of the quartz that could be quarried in that gold-bearing land. But that it was worth mining there was a consensus of negative opinion. King Rufus was not beloved of his subjects, and great was the chuckling that a man so experienced in the land should be so fantastically deceived.

The voice of public incredulity was not unheard by Rufe, but it caused him no qualms. He was not the sort of man to be jockeyed out of his convictions by unbelief, however general. Indeed, his infatuation became the more obstinate, and the pile of quartz outside his dwelling continued to grow, adding to the merriment of Horseshoe. 'Jefferson's Jewel-Dump' became its recognised title.

The crisis of the joke came when King Rufus solemnly announced his intention to take the stage to Helena with a sample of his famous quartz to be assayed. The old man was in high feather over the prospects of his journey. The

oldest inhabitant could not recollect a time when King Rufus had so happily relaxed from his customary taciturnity.

The stage left Horseshoe in the morning, and a small crowd assembled at the hotel to speed their departing monarch, and to partake of the hospitality which he dispensed with unaccustomed liberality. No one had ever seen the old man so jovial. He had brought down a couple of great bags, their bulging sides tied up with cord. To the huge diversion of the company, he insisted on unfastening the cords and displaying the chunks of quartz within, before he carefully corded them up again. He assimilated so many drinks before the stage left that he seemed quite fuddled as he climbed into his place, and at the last moment friendly hands hauled up after him the twin bags, which he had left behind him in the bar. He rewarded their bringers with an incoherent profusion of thanks.

The driver of the stage was let into the joke before he started, and Rufus's fellow-travellers were also made privy to it. It was a very merry party which started up the long mountain-trail. At the several stations at which they stopped during the day King Rufus insisted on getting down and absorbing further refreshment, and treating all who would accept of his hospitality. It was an uproarious journey altogether; though, as the day wore on, Rufus sobered down considerably, and became visibly anxious lest they should arrive in the city after business had ceased.

As a matter of fact, it was well past banking-hours as the stage went round the last twist of the long trail, and came rolling down the Last Chance Gulch, at the mouth of which the up-to-date city of Helena is built on old placer-mining ground. Nevertheless Rufe, with ludicrous anxiety, insisted on taking his precious sample-bags straight to the bank, remarking that the manager lived on the premises, and would undoubtedly stretch a point for a man who had come so far. And the last his fellow-passengers saw of him, he was seated in an automobile, with his samples on either side of him, and his grim old face wreathed in smiles, *en route* for the bank.

IV.

By the time King Rufus reached Horseshoe again, a few days later, he had relapsed into his habitual grimness. He would vouchsafe little information as to the result of his journey, and in his present frame of mind few cared to press him on the subject. It was gathered, however, that he was quite satisfied with the assayers' preliminary report; and whatever the truth of this might be, it was certain that the old man continued to make frequent visits to the 'Gully of Golden Hope,' as the community had christened it, and that the 'Jewel-Dump' continued to grow.

But in the course of a few weeks interest in Rufus's discovery paled before a yet more piquant development. King Rufus had fallen in love! At first the thing seemed too wildly absurd to be credible. Yet there it was, a fact patent to all eyes. Rufus Jefferson, King of Horseshoe, was infatuated with Madge Tremaine, the lovely daughter of his mill foreman. Tremaine's house stood between that of Rufus and the quartz-gully, and whenever the old man visited his 'Gully of Golden Hope,' he would call in at the Tremaines', either going or returning, or both, and competent observers reported from week to week the progress of his courting. It was a supreme joke.

There was, of course, one individual who failed to see anything humorous in the situation, and that was young Alan M'Leod. Poor Alan's open-hearted gaiety underwent a sad change. His honest Scots face became dour. He grew silent and uncommunicative, and toiled ferociously at his work, and his gray eyes, when he encountered King Rufus, looked unutterable things.

For the extraordinary part of it was that dark-eyed Madge herself, though at first she had treated the advances of her elderly admirer with cold disdain, perceptibly thawed as the weeks went by. Rufe was now clearly a welcome guest at her father's house. The girl had been seen openly visiting his quartz-quarry in his company, and gaily laughing as the old man showed her this and that feature. Grinning gossips shrugged their shoulders and asked each other what you could expect when an old reprobate so well lined as Jefferson wooed the daughter of his hired man. Tremaine kept his own counsel, like the stolid Cornishman he was, but it was plain that he saw no objection to the affair.

As for Madge, she was credited with keeping up with poor Alan a flirtation of the most heartless coquetry, showing to the agonised lad a face of smiling innocence, and treating him on the same footing of affectionate intimacy as before the advent of his wealthier rival. But every one could see for himself that Alan's visits to the Tremaines' grew fewer, and that the poor fellow constantly returned from them in a condition of greater desperation. There were not wanting those who prophesied a tragic outcome of the jest of Rufus's courtship.

Then suddenly, within two months of his journey down to Helena, Rufe himself one day publicly announced in the saloon his intention to take the stage with Madge and her father for the purpose of being married in Helena. With the foolish infatuation of an elderly lover, he descanted on the magnificence with which it was his intention to mark the ceremony. There was to be a grand wedding-breakfast at the Placer Hotel—no less a place would serve—to which he extended an open invitation to any of his old friends at Horseshoe who might care to accept.

The old man seemed clean taken out of himself at the prospect.

In a corner of the bar Alan M'Leod was deliberately spoiling his fine young manhood with raw spirit. The dramatic announcement reached his fuddled brain, and he stepped unsteadily forward, fronting the old man with glaring, dangerous eyes. 'It's a lee!' he declared bluntly. 'It's a damned lee!'

The company held their breath. There were plenty of reckless spirits there, but not one of them, even if drunk, would have dared to address King Rufus thus.

The old man started as if he had been struck, and his right hand went to his hip-pocket. There was murder in his fierce old eyes as he pulled out his pistol and frowned into the Scot's flushed face. But with an effort like a man pulling up a restive horse he seemed to jerk himself round, and instead of addressing Alan, he let loose a storm of invective at the surprised bar-tender.

'What in hell do you mean by serving a drunken man in my saloon?' he raged. 'Yes, sir. Seventy-five per cent of this shebeen stands in the name of Rufe Jefferson. If you serve another drink to that young fool across this bar, I'll have you fired out.—As for you, Alan M'Leod, go home and get sober!'

He stalked from the place in a royal fury; and Alan, finding the hired bar-tender suddenly adamant in his refusal to execute further orders, had perforce to make a virtue of necessity, and yield a vengeful submission to the old tyrant's behest.

v

The lad was still sufficiently master of himself to know better than to seek the Tremaine home in his then condition, but next day he deliberately waylaid Madge.

'Madge Tremaine,' said he bitterly, 'ye're killin' me. Tell me, is it true ye're gaun wi' yer faither to be selt tae auld Jefferson at Helena the morn?'

For all her coquetry, fair Madge had an honest face. There was trouble in the dark eyes that met her old lover's eyes, but there was pride there too. She drew herself up. 'I'm not going to be sold to any man, Alan.'

He caught at that. 'Then tell me ye're no gaun, Madge!'

'I am going,' she said.

'An' yer faither wi' ye?'

'Father's going too.'

Poor Alan gave a dreadful harsh laugh. He was too full of bitterness to see the distress on the girl's proud face. 'An' ye're the lass that swore she loved me!' he exclaimed. 'The lass that took ma kisses, an' gied me hers! Ye heartless, fause chit!'

Madge winced under the lash of his contempt as at a blow, but her eyes flashed back into his.

'I wish the auld thief joy o' his bargain!' cried M'Leod.

'If you mean Mr Jefferson, I believe he is satisfied with his bargain,' said the girl coldly.

'I dinna doot it! An' I dinna doot his bargain is weel satisfied wi' auld Rufe! Gray hairs look weel eneuch when they're dyed gold, if the dye is laid on thick. Eh, my God, I'd never have believed it but frae yer ain lips, Madgie!' The man's face worked under the storm of passion which carried his attempted sarcasm before it. He turned brusquely on his heel, and would have left her without another word.

'Alan!'

At the swift softening of her voice he swung round again. He eyed her hungrily, but did not speak.

'Don't be cruel to me, Alan! You don't understand. You can't understand!'

'Can I no!' he cried. 'It's a great fule I maun be, sure! But I'm no that dense, ma lass, that I canna see the difference atween a millionaire an' a miner.'

'Alan'—the voice was soft and pleading—'you kissed me.'

'Ay!' he exclaimed fiercely. 'He canna rob me o' that!'

'Won't you—won't you kiss me again?'

His face twitched, and the blood thumped at his temples, but he stood firm. 'No,' he said, 'I'll no kiss ye again, Madge. If I did, I'd be wantin' to kill ye. An' I wud dae better to kill masel'. An' I winna gie auld Rufe that satisfaction. But ye'll no see me again.'

'Alan,' said the girl, her cheeks burning, 'I've asked you to kiss me, and you have refused. I'll not do it again; but there's one thing you won't refuse me—for the sake of what we have been to each other.'

'An' what's that?'

'I want you to promise on your honour—I know you're a white man, Alan—that you will stay at Horseshoe for a week—just one week—after I go to Helena with Mr Jefferson. Dear Alan, please!'

Through the turmoil of his jealousy and despair that 'Dear Alan, please!' wrought with strange appeal. M'Leod passed a great hand across his brow. He felt dazed and helpless, but, like a drowning man at a straw, he caught blindly at that 'Dear Alan, please!'

'Ye dinna ken what ye're askin' me,' he groaned, 'but I'll promise.'

'Shake!' she said, and smiling up at him with tear-dimmed eyes, she put her small hand in his big one. He held it for a moment in a grip that hurt her, though she gave no sign. Then he flung it from him and strode away.

vi.

The next morning the stage for Helena drove off with King Rufus, and Tremaine and his

daughter. Rufe was sober enough this time, and Madge's trunks and his own were piled in orderly array on the stage before they took their places. The crowd who assembled for the send-off did not have to chase him with forgotten baggage. He was quietly jubilant, though at the back of his mind there was an uneasy mistrust of where that fellow M'Leod might be.

Far up the trail, hollow-eyed after a sleepless night, the Scot lay hid, and with bitterness of soul watched the vehicle drive away into the range.

No two men in Horseshoe could have got through the work that Alan performed in the week which followed. Debarred by his rival's tyrannical prohibition from the drink which he had sought, he took refuge in utter physical exhaustion. He worked as if his very life depended on it, as perhaps, indeed, it did, for the lad was terribly in love, and there was not much just then between him and madness. Once, when a comrade made some jesting reference to his affair, Alan, without an instant's hesitation, hurled a heavy mining-pick with such force that, though it missed the man's skull and took off his hat instead, the iron pick-head snapped in two against the rock. Thereafter Alan was left to nurse his misery without comment.

On the evening of the last day of the week, long after the other men had quit work for the day, M'Leod, haggard and dog-tired, was grimly bending over his toil, when a shadow came between him and the failing light. He looked up and saw Madge. She held out a letter. 'For you, Alan,' said she.

Alan dropped his tools and stared. 'What's this?' he demanded.

'A letter, Alan,' said the girl demurely

'Wha frae?'

'Mr Jefferson asked me to give it to you, and said it was important.'

'I'll no read it,' said Alan dourly.

'Mr Jefferson said, if you would not read it, I was to read it myself.'

'Then ye can read it, Mrs Jefferson. There's nae secrets between man an' wife.'

With crimson face and shining eyes, the girl unfastened the envelope and took out the letter. 'My name is Madge Tremaine,' she said. 'This letter was written to you, Alan, and I think you ought to read it for yourself.'

The meaning of her words penetrated slowly to her lover's brain. His weather-tanned face went pale.

'My name is Madge Tremaine,' she repeated. 'Take it, Alan.'

He snatched the letter fiercely from her hand, opened it, and read the following sentences, written in King Rufus's cramped and angular

hand: 'Alan M'Leod, you goldarned young fool, I oughter have shot you, but it warnt worth while. You see the Tremaines and me had got the better part of 300,000 dollars in dust done up in our grips, and I could not afford to be interrupted by trifles. Guess that Madge is a good girl that can hold her tongue. I gave her father and her a top-notch time in Helena after I had stowed the stuff at the bank, and I've given her 5000 dollars for a wedding present in case she takes a fancy to any of the boys down in Horseshoe. But I guess they aint fit for a girl like that. Praps I'll come back some day, and praps I wont. So long.—RUFJE JEFFERSON. P.S.—You can have my quartz-quarry if you have a mind to it.'

The colour came slowly back into the young Scot's face as he stood staring at the ill-spelt script. 'I doot I'm slow, Madge,' he said. 'I dinna quite get the hang o' this.'

'Sit down, and I'll tell you, Alan,' said Madge. 'You look dreadfully tired, poor boy!' He sat meekly beside her on a jutting rock. 'You see,' she explained, 'old Rufe wanted to go out of business. He had got a big fortune stowed away here in dust, but he was frightened he would get plugged on the trail if the boys had wind he was shifting it to Helena. You see, he's not what you would call a popular man, anyway, and half-a-million dollars is kind of tempting to some folk. So Rufe hit on the notion of that quartz-quarry. He got away with a lot of stuff on the bluff that it was quartz samples that he was going to have assayed; but there was a lot more left, so he had to think of something else before he could move it safely. He didn't think the sample lay would work a second time. So he opened up to my father, who was the only man he thought he could trust, and he offered father a good commission for his help. But it was to be a dead-secret, you understand. So it was put about that Rufe and I were going to be married. If it hadn't been for you, Alan, it would have been the greatest fun; but I was terribly afraid you would go and do something to upset the whole scheme. I never thought you would have believed it; Alan. But you did, you silly boy. Well, we got to the bank all right, without a soul suspecting what was on, and emptied our packs. And then, when we came out, Rufe had another little pack that he put in my hands. "That's for you, my girl," he said, "in case you ever want to be married."'

Alan's honest face was a study.

Madge's dark eyes drooped shyly, and the toe of her little shoe fidgeted with the gravel. 'You don't want me to ask you again, do you, Alan?' she murmured gently.

Alan M'Leod didn't. Words failed him, but actions speak louder than words.

THE MONTH: SCIENCE AND ARTS.

CHEAP POWER FROM RIVERS AND TIDES.

WHAT may be termed 'current water-wheels' have been used almost from time immemorial for generating small amounts of power for pumping water and other purposes. These contrivances consist of wheels having curved buckets—or even flat boards—set radially round their peripheries in a similar manner to the floats on the paddle-wheels of steamships. In action, however, there is the important difference that, while in the latter case the floats push the water, in the former the water pushes the buckets or flat boards, and thus causes rotation. In swift rivers considerable amounts of power can be developed at a very low cost, the expense resolving itself into (1) the interest on the outlay for the wheel and gearing, and (2) the cost of upkeep, which in the case of so simple an appliance is very low. With low-speed currents, such as those normally produced by tides, the amount of power available would be very small relatively to the size of the wheels; and with a view to obtaining more power without proportionately increasing the size and cost of the apparatus, an improved form of current water-wheel has been invented by Mr Joseph Clarkson, engineer and manager of the Air Power Co., Prestwich, Manchester. The arrangement takes the form of an endless chain or chains (there may be two or more for wide buckets) which run round sprocket-wheels at each end of a floating frame moored in a river or a tideway. Attached to the chain (or chains) are buckets or flat-board floats; those on the portion of the chain under water are pushed along by the current until they emerge from the water at the rear, and return to the front through the air, the contrivance bearing some resemblance to the caterpillar traction-belts used on tanks and on some agricultural tractors. Naturally, when the chain is pushed along the sprocket-wheels are turned, and power may be taken from their spindles. It might be thought that one bucket would absorb some of the pressure that would otherwise reach the next behind it; but this is not the case provided that the buckets are fixed at the correct distance apart. An experimental current wheel of this description was tried recently on the Mersey by the chief engineer of H.M.S. *Conway*, Lieutenant-Commander Le Mesurier, R.N., when it was found that power could be developed from currents of only two miles an hour at a lower cost than from coal. On the assumption that the bucket-chain is run for four periods of about three hours each per day when the tide is strongest, and the power is used to drive a dynamo from which the electricity is stored in accumulators, it is claimed that electric current can be supplied continuously for less

than a penny a unit. This figure is based upon an allowance of 10 per cent. for interest and depreciation on the capital outlay for the actual power-production gear, and of $12\frac{1}{2}$ per cent. on the cost of the electric apparatus. Moreover, the power developed is based upon a current of only two miles an hour, which is greatly exceeded in the Mersey. In rivers with currents of only two miles an hour which flow continuously, double the amount of electricity would be produced at less than half the cost, as no accumulators would be needed; while in swift rivers power could be developed at a very low figure indeed.

A VALUABLE FRUIT-JUICE.

That the juice of an edible fruit should be waterproof when brushed on to surfaces as a varnish or lacquer will come as a surprise to many. Such, however, is the case with the juice expressed from the Japanese persimmon, or date-plum, which is used extensively in the 'Land of the Rising Sun.' In addition to being impervious to water, coatings of persimmon-juice are insect-proof and are unaffected by heat. According to the *Japan Magazine*, this substance is particularly suitable for mixing paint for damp climates, such as that of Japan. It is also used either as an adhesive or a varnish (or both), for packing-paper, umbrellas, raincoats, paper-boxes, waterproof bags, and insect-paper, and is employed for putting a gloss on silk, on tortoise-shell, and on similar surfaces for which varnish or lacquer is used in this country. For mixing paint for ships' bottoms and for buildings persimmon-juice is said to be invaluable; in fact, it is stated that ordinary oil-paints would not withstand the damp climate of Japan without it. The fruit of the persimmon grows to a huge size, berries exceeding a pound in weight being not uncommon. An appliance similar to a cider-press is used for extracting the juice.

X-RAYS FOR DETECTING DIAMOND THIEVES.

Diamond-mining in South Africa is carried on mainly by native labour, and the blacks are prone to steal the precious stones when opportunities arise. Naturally they are searched on leaving the mines, but although they are stripped for this process, various tricks are resorted to whereby a considerable number of diamonds are passed out undetected. Recently X-rays have been invoked by the superintendent of a large mine for discovering concealed diamonds about the naked persons of the natives, and this plan has proved entirely successful. Enough X-ray tubes (of the Coolidge type) are so mounted in a frame as to illuminate the whole body of a native standing in front of them. This arrangement permits of viewing all

parts of the body through a fluoroscope in a few seconds—a *sine qua non* when hundreds of natives have to be searched within a short space of time. It might be thought that, provided the diamond were masked behind a mass of bone, it would not be detected; but the difference in transparency between the two substances, and the tendency of the diamond to glow when lit up by X-rays, render its discovery comparatively easy. The failure of other means of detection can be readily understood when one learns that the stones are often swallowed, and have been secreted even in self-inflicted wounds.

A MECHANICAL ROAD-MAKER.

Roads and streets all over the country have been worn into a bad state during the last five years, and an enormous amount of work will have to be expended upon them in the near future if the surfaces are to be put into their pre-war condition. Gangs of men are to be seen repairing the streets in many parts of London, and in Brixton an interesting machine has been introduced by Messrs John Mowlem, the well-known contractors, with a view to expediting the work, while economising in manual labour. Streets laid with wood pavement have a foundation of concrete, composed of one part of Portland cement to three of sand and five or six of broken stone, gravel, or other similar material. Hitherto the concrete has been mixed at the side of the road and wheeled in barrows to the place where required, the operations being carried on entirely by hand-labour. The new device, known as the 'Lake-wood-Milwaukee Paver,' consists of a four-wheeled trolley, upon which is mounted a rotary concrete-mixer with a steam-engine and boiler or an oil-engine to drive it, the power being also available for propelling the vehicle and for dumping the mixed concrete at any point in the road. The dumping is carried out by a steel bucket with a capacity of fourteen cubic feet, made in the form of a hopper, and fitted with doors at the bottom. This bucket is hung from a trolley which runs on a swinging horizontal steel arm with a radius of sixteen feet. A wire-rope passing round a pulley at the end of the arm serves to haul out the loaded bucket to the point desired, the return journey being effected by a second rope. The action of hauling in the latter releases a trigger gear that holds shut the doors at the bottom of the bucket, which therefore open and allow the concrete to fall out during the return journey; or, if desired, the complete bucketful may be dumped at one point. Winding drums, driven by the engine, haul in and pay out the wire-ropes as required. At the inner end of the arm the bucket hangs under the spout of the concrete-mixer. The materials are conveyed into the mixer by means of a hinged shoot with a wide, flat end, which can be lowered so

that it rests on the ground. When the cement, the sand, and the stone have been shovelled into the shoot in this position, it is hauled up by the engine through a winding gear until the contents slide by gravity into the mixer.

AN ELECTRIC BATH-CHAIR.

No type of vehicle other than the bath-chair gives the silent, restful motion so necessary for invalids. Except on flat paths and roads, however, a fairly strong man is needed to draw a bath-chair containing a heavy person. This being the case, it is only natural that attempts should be made to propel these vehicles by mechanical power. For this purpose the petrol motor is put out of court by the noise and vibration accompanying its use, but a means of silent propulsion is to be found in the electric motor. An electric bath-chair which has been perfected and placed on the market recently is known as the Elieson-Carter electric invalids' carriage. The body is roomy and comfortable, but needs no special description here. The driving-gear, however, is unique, and possesses many interesting features. Unlike the wheels of a car, the front instead of the back wheels are driven by the motor, which is mounted immediately over the front wheels, where it is entirely out of the way of the occupant of the chair. Owing to the absence of any need for spring suspension of the motor, the transmission-gear is exceedingly simple, consisting of a worm on the motor-spindle, which engages with teeth on a wheel keyed to the front axle. Two front wheels are adopted in these chairs instead of one, and they are both fixed to one axle, with the aforesaid driving-wheel between them. The motor has a vertical spindle, and is therefore above the axle instead of out on one side, where it would be very much in the way. Friction due to the weight of the motor armature (the revolving part) and to the drive of the worm is eliminated as far as possible by ball-bearings. Worm transmission is vastly superior to other types for these chairs owing to its silent running as compared with chain-drives or ordinary gearing. Electric current is supplied by a storage-battery of twenty cells carried under the seat, where it is easily 'get-at-able' and takes up no space needed for other purposes. This battery may be charged from the lighting circuit of the house in which the chair is kept, or at a garage, the cost being small in either case, and it will run the chair for twenty miles on one charge. The operation of the electric invalid-carriage is very simple, only one lever being concerned in going forward. All the occupant has to do is to push forward this lever more or less according to the speed required, which ranges from a crawl to five miles an hour. Even the brake is worked by this same lever, being put on when the lever is brought back to the stop position. On pulling over a smaller lever, the same range

of speed is available for going backwards. There is no cranking, oiling, or filling of petrol-tanks, and no adjustments are needed, the carriage being ready to glide off at any time. A secret switch prevents the use of the chair by would-be thieves when it is left standing unattended; while a small fitting on the front axle, on being released, disconnects the transmission-gear, so that the chair can be pushed along by an attendant in cases of emergency.

MOORING-TOWERS FOR AIRSHIPS.

So long as they remain afloat modern rigid airships are not easily damaged, but the greatest care has to be exercised during the operations of manœuvring the vessels into, and out of, the huge sheds in which they are housed. Even under the calmest conditions, 300 or more men are required to effect the housing of a large airship; while on many days in the year when flying itself would be perfectly safe the vessel has to remain idle owing to the difficulty and danger of bringing it out into the open and housing it again. The natural solution of this problem was the mooring of airships clear of the ground in such a manner that they could swing round with the wind. This method of overcoming the difficulty entailed a mast or a tower to which they could be moored at a sufficient height to ensure their keeping clear of the ground under all conditions. Then it was suggested that gas, petrol, and water should be supplied through such towers, and finally that the passengers and crew should obtain access to the gondolas by them. Towers serving all these purposes are now being made by Vickers Limited, of Barrow-in-Furness, the world-famous builders of warships and all kinds of aircraft. One or more towers will be provided at every aerodrome, and round the bottom of each may be built a passenger and goods station. The tower itself is constructed of steel lattice-work, and rises to well over 100 feet, the top being stayed by steel wire-rope guys, securely anchored to the ground. A passenger-lift runs up the inside of the tower and delivers passengers on to a platform in the enlarged head. Mounted above the platform chamber is the swivelling head to which the nose of the airship is attached by a patented coupling. This coupling, while being perfectly secure, allows of some vertical movement, so that no strain comes on the tower when the airship floats with her tail slightly up or down. Once the nose is made fast, a flexible gangway, similar to those between the coaches of corridor-trains, is extended between the swivelling head and a passage into the airship. On alighting at the top platform, passengers ascend a staircase into the swivelling head, and proceed thence through the flexible gangway into the airship. At no point are they exposed, although they can look through small windows in the lift-car and the tower-head. The lift is worked by an

electric motor in the top-platform compartment. In the swivelling head is a winding drum (worked through gearing by another electric motor), upon which is wound 1000 feet of the highest quality steel wire-rope. A similar outfit, with 600 feet of wire-rope, is situated in the bow of the airship, the end of this rope being passed through an attachment on the nose which fits into the patent coupling forming part of the swivelling head. After an approaching airship has notified by wireless her intention to land, the wire-rope at the head of the tower is threaded through the patent coupling and paid out until the end reaches the ground, when it is attached to a light car and driven away from the tower in the direction from which the airship is approaching, the rope uncoiling from the drum as the car proceeds. When 700 or 800 feet from the foot of the tower, the end of the rope is detached from the car and landing-signs are laid down to indicate its position to the airship pilot. Meanwhile the ship is approaching at a height of 500 feet, which is the normal procedure for landing with the apparatus being described. On arrival over the end of the rope pulled out from the tower, the bow mooring-rope of the ship is released, and runs out through the fitting on the nose under the pull of several hundred pounds weight of sand-bags. The release of the bow mooring-rope is under the control of the bow-hand, who can check, or accelerate, the rate of fall of the rope in such a manner as to ensure the descent of the sand-bags in the immediate vicinity of the landing-party, which need not exceed six in number. Two men of this party now take charge of the rope which has dropped from the ship, unshackle the sand-bags, and effect a junction with the mooring-tower rope, which is in the hands of the remaining men of the landing-party. The rope-ends are coupled together by means of a special self-locking coupling, which enables the junction to be made in the space of from three to five seconds, and which, when once closed, will not allow the ropes to separate until the coupling is released by hand. On receiving a signal from the ground-party, the men in charge of the winding-gear in the mast-head proceed to haul in. As the rope tautens, ballast is discharged from the ship, and she continues to maintain her height well above the ground and the mast-head, while the distance between herself and the latter is steadily decreasing. On approaching close to the mast, the amidships propellers are put astern, and the ship is slowly hauled into connection with the automatic coupling already set in the open position to receive the attachment on the nose. When once this coupling is closed the mooring-ropes can be dispensed with, the ship's rope being re-wound on to the storage-drum in the bows, and the end suitably stowed ready for making the next flight. After landing at the mast-head, connection is made with the supplies of hydrogen,

petrol, oil, and water; and fresh gas, fuel, and water-ballast are placed on board in order that the ship may be kept in trim during the discharge of cargo, and the embarkation of passengers and stores may be effected. When it is desired to leave the mast-head for flight, the pulling of a lever in the automatic coupling releases the airship. She then draws astern and upwards under the influence of the prevailing wind until she is well clear of the landing-station and can proceed on her course. The design of this apparatus is such that the landing of an airship can be effected as easily in a strong wind as in complete calm, and a ship is enabled to effect a landing in practically any wind in which it is safe for her to fly. Should the wind be so high (that is, over sixty or seventy miles per hour) that the ship cannot reach a given mast, it will always be possible for her to ascertain, by means of her wireless, the nearest station at which favourable conditions obtain, and she will there make her landing, proceeding on the abatement of the storm to her true destination.

DICTIONARY FOR COMPUTING INTERNATIONAL
COMMERCIAL QUOTATIONS—VOLUME II.

In our issue for March 1919 we referred in eulogistic terms to Volume I. of Mr James Robertson's *Dictionary for Computing International Commercial Quotations*, pointing out how serviceable it would be to the British merchant who traded with any part of the continent of Europe. We have now before us Volume II., intended specially for those who do business with North or South America. Careful examination shows that the new volume is just as serviceable and as reliable as its predecessor. With its aid the British trader can readily convert any price expressed in his own currency and weights and measures to the equivalent price in the currency, weights, and measures of any country on the American continent. The reverse operation can be performed just as quickly, ample provision being made in both cases for fluctuations in exchange. To the importer and exporter these volumes are a veritable boon, enabling catalogues to be compiled and quotations to be given in a form intelligible to the customer with an ease, accuracy, and speed hitherto unattainable. We understand that a third volume, dealing with the East, is in active preparation.

NEW COLOUR-MATCHING APPARATUS.

Until the advent of the invention that forms the subject of this note the only artificial light in which colours could be matched with any satisfactory degree of success was filtered through special screens of glass and gelatine, by means of which the blue end of the spectrum was strengthened relatively to the red, artificial light—even from the electric arc—possessing a much

smaller proportion of blue and violet rays as compared with red and yellow rays than is characteristic of sunlight. The new correcting apparatus consists of a concave reflector fixed below a powerful electric lamp or series of lamps (those used in the experimental model were of 600 candle-power), by which the light is directed upwards on to the inside of a curved screen. Small patches of different colours, arranged according to a formula calculated from the results of experiments on the pigments, form the inner surface of this screen, from which there is reflected downwards light that almost equals daylight for the matching of colours. Invented by Mr G. Sheringham, the artist and designer, this device has been developed at the Imperial College of Science and Technology by Mr L. C. Martin, with the help of Major A. Klein, late of the Camouflage School, and colour adviser to the Cotton Printers' Association, and was exhibited recently before a meeting of the Illuminating Engineering Society. A representative of the *Times* who compared coloured wools, Chinese enamels, pastels, and prints by daylight, ordinary electric light, and the new Sheringham light successively, states that under the last-named 'delicate yellows were quite distinct, indigo blues were blue, cobalts had their full value, and violets lost the reddish shade which they display in electric light.'

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

KISSES FOUR.

Love kissed the earth all gaily,
And whispered Summer's name;
A thousand lilies awakened;
The roses stood aflame.

Love kissed the earth all sadly;
The blossoms paled and died;
And frightened, sobbing Summer
Saw Autumn by her side.

Love kissed the earth all coldly;
The very hedges froze,
And Winter's heartless laughter
Rang o'er the buried rose.

Love kissed the earth all shyly;
Sweet Spring, asleep too long,
Came dancing out of heaven,
And earth became a song.

EDITH L. ELIAS.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

HENRIETTE DE BEAUVALLON.

By LETTICE MILNE RAE, Author of *Eagles of Rome*, &c.

PART I.

I.

THE advent of one of Napoleon's generals as a prisoner-of-war on parole was hailed with enthusiasm in Dulbury. The news that he was young, handsome, and covered with medals spread like wildfire, till every maiden's heart fluttered and all the matrons began to consider what steps they should take to annex him.

The national prejudice against the French had considerably abated of late years in Dulbury owing to the presence of a young *émigrée*, Mademoiselle Henriette de Beauvallon, now known under the abbreviated and anglicised title of 'Mamselle Vallong,' who had fled from the terrors of the Revolution, and, after various vicissitudes, found a haven of refuge in Dulbury in company with her compatriots, the Comte and Comtesse de St Armand.

At first Dulbury had looked askance at the refugees and eyed them with deep distrust; but when it found that they ate neither snails nor frogs, did not cheat or steal, or challenge any one to a duel—all of which enormities Dulbury had hitherto believed to be synonymous with the French—it inclined to be more charitable in its attitude to the strangers, and even showed them no little kindness.

The *ci-devant* aristocrats led an extremely quiet and decorous life at Widow Watkin's, eking out a livelihood by giving lessons in dancing and the French language, until Madame la Comtesse drooped and died, and Monsieur le Comte departed to America, where his son was prospering. He had begged Henriette de Beauvallon to accompany him and try her fortunes in the New World; but changes had been so frequent in her life that she felt she could not face another, and so elected to remain in Dulbury and continue the dancing lessons.

When Henriette reviewed her four-and-twenty years of life, they appeared to be divided into as many scenes as a play. She had made her entrance in the Château de Beauvallon in beautiful Touraine; yet her earliest memories were not of the castle by the Loire, but of the humble peasant home where she had been put out to nurse, and where she had remained until her

ninth year. That had been the happiest time in her life, when Mère Jeanne Raimond had loved and tended her with a love far excelling that of Madame la Marquise, her mother, who, indeed, had forgotten all about her daughter amid the distractions of Versailles—which accounted for the unusual length of time that Henriette spent with her foster-mother. And then there was Marcel Raimond, her foster-brother, three years her senior, who had also loved and tended her with unflinching devotion. Ah, what happy playmates they had been, little brother and little sister, unconscious of the great gulf that lay between them, untroubled by the poverty, the bad harvests, the wrongs of the peasantry, and the murmurs of discontent! Small wonder that Henriette de Beauvallon looked back on those years as her paradise on earth!

The scar on Henriette's cheek dated back to that blissful time. It was a very disfiguring scar that ran from the corner of her mouth half-way across her left cheek, and gave her face, when seen in profile, the appearance of perpetually wearing a grin that was strangely incongruous when compared with the sweetness of the unscarred side. Yet Henriette rather valued that scar, because it was reminiscent of those happy days of childhood. It brought back the moment of exquisite delight in a forbidden world of white cherry-blossom, into which she had climbed with Marcel's assistance, though entirely against his advice. Of the subsequent abyss of darkness into which she had fallen she remembered nothing, nor of Marcel's agony of distress when he beheld his precious little foster-sister lying motionless with a great bleeding gash across her face.

But the scar also recalled to her mind another scene she would fain have forgotten. It was the last in the First Act of her life, when Madame la Marquise, on one of her rare—very rare—visits to Beauvallon, had suddenly remembered the existence of her daughter at Mère Jeanne's, and swooped down to claim her. It was no joy to Henriette to recall that first meeting with her mother, who appeared in the guise of a very fine lady, beautiful to gaze upon, but

very terrifying to hear as she abused Mère Jeanne for her carelessness in permitting such a disfigurement to befall the sacred person of a De Beauvallon. Henriette could still remember her childish screams of protest and dismay when she found she was to be borne away by this dread stranger to the great château that frowned down upon the orchards and the humble dwellings of the peasants.

II.

Then the curtain had gone up upon the Second Act of Henriette's life. The scene was the Carmelite Convent of the *Sacré Cœur* where she had remained until she was seventeen. Across the stage flitted the gentle figures of the nuns, the grave and dignified Mother Superior and her gay, light-hearted charges, Henriette's schoolfellows, into whom she had tried to instil something of her own stateliness and decorum. The years at the convent had been happy too. From within the shelter of its walls the world had seemed a very wonderful and delightful place, full of all kinds of pleasures forbidden by the sisters. Even within its quiet precincts life had not been without its interests for Henriette. It was at the *Sacré Cœur* that she had become acquainted with Jane Howe, the warm-hearted, generous-natured, if somewhat eccentric, English girl whom she had admired and worshipped with schoolgirl devoutness. Jane was the child of a French Roman Catholic mother and an English politician whose advanced democratic views were fully shared by his daughter. It was Jane Howe who had first awakened Henriette to the Rights of the People and the iniquities of the *Corvée* (tax paid in compulsory labour), the *Gabelle* (salt tax), and the *Taille* (a tax levied on land—nobles, clergy, and holders of office being exempt), until her heart burned within her with shame and indignation against her order. Oh, those walks and talks in the convent garden with Jane Howe—could she forget them?—when they two would conjure up glorious visions of a Universal Brotherhood of Man, with all the social wrongs and injustices swept away! It was Jane Howe, in fact, who sowed the seeds of democratic principle—in ground unconsciously prepared, no doubt, by those years of Mère Jeanne Raimond's care—that were to take strong root in Henriette de Beauvallon's heart.

At the *Sacré Cœur*, too, Henriette first discovered the joys that lay between the boards of sober-coloured books, and the still greater joy of impersonating the characters described in that world of romance. This Henriette had found to be particularly her *forte*, and she used to thrill her companions by acting to them scenes from Molière and Racine in a manner that caused the good sisters to shake their heads and wonder if it were not a sinful propensity to be crushed by prayer and penance. 'It is a gift of the good God, child,' said the wise old Mother Superior. 'May you always use it for good, and not evil!'

III.

It happened that Henriette did have occasion to use this talent, and for good; but that was in the Third Act of her life, when the scene had changed from the convent to the gay world where she followed the vagaries of Madame la Marquise, her mother, and her brother, now Marquis de Beauvallon.

They were at Beauvallon, and Henriette joyfully renewed her acquaintance with the home of her childhood after eight years' absence. In spite of Jane Howe's teaching and Henriette's full acceptance of her tenets, the years had inevitably marked the gulf which lay between her and her former friends. But for Mère Jeanne she still retained her old affection, and sought her out at the earliest opportunity. Henriette inquired with eager interest for her playmate, Marcel. He had grown to be a very promising young man, Mère Jeanne told her with maternal pride. He had good looks and keen intelligence, and Monsieur le Curé had taken a fancy to him, and taught him to read and write as well as himself, and hoped to make him a priest. But Marcel's heart did not lie that way, and he preferred to remain as he was, helping his father on the farm.

One wintry day, driving along the roads in a high curricule attended by a lackey, Henriette had encountered Marcel leading home a donkey laden with faggots from the forest. Her attention had been drawn to him owing to her lackey's insolence in nearly running him down and then breaking forth into a volley of abuse because he had not moved out of the way more sharply. The blaze of righteous anger that leapt into Marcel's eyes as he turned to face the insolent flunkey, and its sudden dying away in a downcast gaze of abject submission as he recognised Mademoiselle Henriette, revived all her enthusiasm for Jane Howe's advocacy of the Rights of the People, and she greeted Marcel with a gracious courtesy that brought him literally, as well as metaphorically, to his knees before her. But the sight of him humbly kneeling in the snow with bent head as before a shrine brought a pang of regret to Henriette's heart. She realised that, whatever her sentiments might be, the old intimacy could be no more, nor could the chasm be bridged over. Henceforth she was Mademoiselle Henriette de Beauvallon, aristocrat; he was Marcel Raimond, a son of the people.

But even from her high position she endeavoured to hold a certain kindly intercourse with her foster-brother. She found occasion to express her interest and sympathy in his education, and told him of the wonder and pleasure that was to be discovered in the world of books. Sometimes she would even declaim lines from the dramatists in her own inimitable fashion until the peasant-scholar gazed spell-bound and enthralled at his instructress.

They were standing thus one day in the forest, close to the château, when they were discovered by Monsieur le Marquis, who was returning from the chase with a party of friends. Marcel had been engaged in chopping wood when Mademoiselle Henriette, wandering unattended in defiance of all rules of propriety, had come upon him by chance and fallen into conversation. Their talk, beginning with woodcraft and politics, had passed on to literature, and ended by Henriette reciting to him from Racine's masterpiece one of *Athalie's* famous speeches.

Finding them so, Monsieur le Marquis's anger leapt into a flame at the outrageous audacity of the peasant in daring to stand and hold speech with, or even to look at, mademoiselle his sister, and he promptly struck Marcel a violent blow across the face with his riding-whip. The youth staggered, blinded and stunned; but recovering himself, with an anger that equalled that of the marquis blazing in his eyes, he boldly faced his assailant and demanded the right to cross swords with him.

The marquis was outraged and aghast at such a suggestion coming from one of his own peasants, but his companions urged him to accept the challenge for the jest of it, and give the vermin his deserts. Henriette stood by, distressed and horrified beyond words by the turn of events. It was terrible enough that her brother should have come upon her in company with Marcel and misinterpreted the scene. In her own heart she knew that she had never demeaned her proud lineage by speaking with this lowly foster-brother, and that he had ever regarded her in utter reverence, as befitted his peasant blood. But Monsieur le Marquis could not be expected to understand such a position, nor could he altogether be blamed for striking the blow. He was only following the fashion of the day. He belonged to the old *noblesse*, and was ignorant of all things save those which appertained to his order. In truth, it was Marcel Raimond who had transgressed against the canons of civilised society by daring to claim the right of crossing swords with the Marquis de Beauvallon. It was an unheard-of proceeding, and could only end one way. The De Beauvallons had been noted swordsmen for generations, and Monsieur le Marquis excelled the reputation of his house. Marcel had only practised the art surreptitiously in his father's barn, because the muttering of 'Liberty, Equality, Fraternity,' was becoming daily louder in France, and Marcel, being young and ardent, supported the new theories with enthusiasm. A chance had now come to hand whereby he could carry his theories into practice and meet Monsieur le Marquis as an equal, and without a thought of fear he determined to seize it.

Shocked as she was at his boldness, the certain knowledge of the result filled Henriette

with horror and misery. She seemed to see Marcel lying gasping his life out through a thrust from her brother's sword. The vision turned her sick, and she resolved, if possible, to prevent the meeting. Yet what could she do? No words of hers could have any effect upon the marquis. The duel was fixed for that evening after supper. It was to take place in the *salle d'armes* of the château, in the presence of the noble company the marquis was entertaining. The hour came, and Marcel presented himself in the *salle d'armes*, pale, grave, and resolute. He was provided with a sword from the marquis's armoury. The blades were measured, the opponents stood facing one another, when the door swung open and Henriette appeared upon the threshold like an apparition, pale as death, and with a strange, unusual expression upon her face—an expression of contempt and hate and scorn that seemed to pierce Marcel's heart as her eyes fell upon him.

'Marcel Raimond, what do you here?' she asked in a cold, cutting voice.—'Armand, my brother, what is this? You are going to cross swords with one of the *canaille*—you, a De Beauvallon—one of the *noblesse d'épée*? Consider, I pray you! His reptile blood would stain your blade for ever, and be a blot upon the honour of our house. Ugh! I shudder.'

Then she lunged again at the peasant swordsman with piercing thrust. 'Marcel Raimond, you dare to set foot within the Château de Beauvallon to meet Monsieur le Marquis as if you were his peer? You dog of a peasant! Is it because you happen to be my foster-brother—because I have condescended to let my eyes rest upon you—to let a word fall from my lips as I would throw a bone to a cur—that you dare to aspire to this? Ha! You scum! You rat! Pig, go back to your sty! Go! Go! Go!'

Her voice rose with impelling fury, and she pointed a terrible finger to the door, with her dark awful eyes fixed upon the cowering Marcel. It was more than he could endure. The blow of the marquis was as nothing compared with the scorching bitterness of Mademoiselle Henriette, whom he had adored. With a cry he let fall the sword upon the flags of the *salle d'armes*, and turned and fled through the door to which Henriette's finger pointed him, breathing vengeance in his wounded pride against the De Beauvallons and all their order.

He did not know that in her chamber Mademoiselle Henriette upon her knees thanked the good God for His gift to her—the gift that enabled her to impersonate so successfully a truly aristocratic virago, blasting the upstart peasant duellist with a vituperation that had reduced even the marquis and his friends to a state of amazed and impotent silence, when all the while within her heart had rung the agonised cry to Heaven, 'Save him! Oh, save him! Help me to save him!'

IV.

But Marcel did not know this, and Henriette had never had a chance to enlighten him. They did not meet again; nor did she try to seek him out, perceiving that her efforts to bridge over the chasm that lay between them brought only greater wrong and trouble. And so the spark of hate that was kindled that night in Marcel Raimond's heart glowed and burned, fanned by the winds of strife and discord that were blowing tempestuously through France, until at length it burst into a flame that fired the Château de Beauvallon.

That was a very terrible scene for Henriette to look back upon. She could see it all still with horrible distinctness—the gay company within the château, unconscious of danger, indifferent, callous indeed, unheeding the signs of the times. It was the night of her *fiançailles* with Monsieur le Marquis de Lafère. But it had not been on that account a day of supreme bliss. She had had no desire to be betrothed to the count. There was no love in their union—rather the reverse for her. He was not young, nor was he well-favoured. But Madame la Marquise had commanded, and Henriette had been forced to obey.

They were all at supper in the banqueting-hall when tumult broke out in the courtyard. It was swift and overwhelming. An unwashed and ragged host, drunken with the lust of revenge and armed with hideous weapons, burst

into the hall and began their awful work of slaughter and spoliation.

'Are these the People—the People of Jane Howe's dream of Democracy triumphant?' was the sudden, sorrowful question that flashed through Henriette's brain. Then a great and merciful darkness came over her. She did not see her brother meet his fate, nor her mother hers. It was well. The only thing she did see when her senses returned was Mère Jeanne bending over her, murmuring endearing words. She found she was lying in one of the surrounding plantations, brought thither by Mère Jeanne's arms, while the sky above them was ruddy with the reflection of the burning château.

Thus the curtain dropped on that Act of her life. The scenes that followed were confused and blurred. She vaguely remembered being packed into a rude cart beneath vegetables and cheeses and driven to the nearest market-town by Mère Jeanne. There she had been handed over to the care of a relative of her foster-mother, in whose house she spent perhaps a week, perhaps more, she could not tell now, for she had lived a close prisoner in a little attic and lost count of things altogether. Then Mère Jeanne had contrived to link her foster-child's fate to that of the Comte and Comtesse de St Armand, neighbours at Beauvallon, and refugees from the same cause; and with them Henriette had at length found safety in England.

(Continued on page 169.)

THE WRECK OF THE AURANIA.

By WALTER MENZIES.

THROUGHOUT the entire length of the west coast of Scotland there can be few shores more wild and inhospitable than the north-west corner of the island of Mull, round Caliach Point. There is nothing in the nature of a beach. Great rocks and huge boulders, resembling a vast herd of petrified monsters, fringe the foot of the cliff, which rises abruptly from the water's edge. At that rugged promontory the sea is never wholly quiet. Even on the calmest days the great swell of the Atlantic rolls in unbroken, making the hollow crannies in the cliffs sing their uncanny chant, as they are filled and emptied again with the rise and fall of the waves. But let there be a breeze—farther up the Sound it is nothing—here at Caliach Point the sea begins to break, and the white horses to chase one another to the shore. At no time a pleasant place for a small boat, it then becomes a dangerous spot even for a fair-sized vessel.

In the Gaelic *caliach* means an 'old woman.' The name is apt. Here, like some evil spirit, the Old Woman sits, remote from human habitation. Year in, year out, she hears naught but

the screech of the gale, the lashing of the waves, and the scream of the gulls, as she waits for what the sea may bring. Black, long-necked, crested cormorants preen themselves on the rocks. At low-tide seals lie basking in the sun. Up above circle unceasingly the great solan geese, ready at the first silvery gleam of mackerel to plunge headlong straight from the clouds into the waves. These are all the company the Old Woman enjoys.

A few miles out to sea appear the white rocks of Coll and the gleaming sands of Tiree. To the south lies the Dutchman's Cap—the similarity to the headgear of the beefeaters at the Tower is remarkable. Away on the southern horizon rises the outline of Iona. To the north are seen the islands of Canna, Rum, and Eigg; and beyond them glitter in the sunshine in all their grandeur the far-famed Cuchullin Hills of Skye. Verily, a wild and desolate spot. Wherever the eye is turned the clouds are pierced by great mountains rising one behind the other in seemingly endless succession.

It was a bright summer day when last I visited Caliach Point, and although it was

perfectly calm in the Sound of Mull, yet here the sea was running and the wind whistling in the rigging. But when the winter storms are raging it is an awe-inspiring sight. Then it becomes a boiling cauldron, a seething whirlpool, a roaring chaos of green water and white foam, with the great waves dashing on the rocks and flecking with spume the green turf that serves the Old Woman for hair. He would indeed be a reckless man who sought to effect a landing there. Yet what man in his prudence shrinks from attempting, ruthless Destiny accomplishes; for, out of all the west coast of Scotland, inscrutable Fate chose Caliach Point as the final resting-place for a fine, tall ship.

The *Aurania* was a brand-new Cunard liner of nearly 14,000 tons, and had started on her third voyage across to America when she was torpedoed off the north coast of Ireland in January 1918. She was considered to be in a sinking condition, and all on board took to the boats. There was a high sea running, and unfortunately some seventeen lives were lost. It was thought, however, that the great ship might be towed to safety, and she was picked up and taken in tow by tugs. During the night the cable snapped, and, with such a wind blowing, it was deemed impossible to take her in tow again in the darkness. The tug-boats made the best of their way to their stations, reporting that the *Aurania* was as good as lost—as indeed those in charge had reason to believe was the case. In the morning search was made in all likely directions for the liner. Not a trace of her was found, and it was assumed she had gone to the bottom. However, abandoned by man, derelict, at the mercy of the Atlantic in mid-winter, nevertheless the great ship made a bold bid for safety. For no less than ten days did this floating mountain drift about, driven this way and that, leading, it would appear, a charmed life. Unseen of man, she was driven northwards. The inclement coast of Islay—off which another great liner, the *Tuscania*, met her doom—was passed without let or hindrance. Scatheless she left behind her the wild islands of Oronsay and Colonsay. With fortune that, on a glance at the map, appears almost divine, she steered a safe course past the dangerous Dhu-Heartach Rock and its lighthouse. Nay, she may even have made and weathered the great Skerryvore—that outlying Pharos, monument to the ingenuity of the Stevenson family. Neither the strand of Tiree, gleaming with white sand, nor the cavernous rocks of holy Iona were deemed meet as an altar for the sacrifice. It was left for the Old Woman to receive in her lap this offering from the sea—the sea that for so long had dashed nothing but its own angry waves against her.

Picture this great Argonaut, her brasses shining, her white decks gleaming, her huge funnels towering some hundred feet above the

sea, her masts reaching a still dizzier altitude, pursuing all that time her wild, erratic course—a modern *Flying Dutchman*. Surely it is a fitting subject for a second *Rime of the Ancient Mariner*. Much has been said and written of the Spanish treasure-ship that sought safety and fresh water in Tobermory Bay—some sixteen miles distant from the Caliach Point—only to be sunk by the wild clansmen. Much money has been spent in trying to recover this problematical Spanish gold. Yet here was a more valuable booty; here was a treasure rich and rare—not at the bottom of the sea, but ashore on an inhospitable coast.

No effort was made to save the *Aurania*. It does not seem to have been thought worth any one's time and trouble to remove even any of the fittings, themselves of no small value. Yet it would not have been a work of surpassing difficulty. She lay with her bows well out of water. Four of her promenade-decks were unsubmerged. Her stern lay under water. This was her condition early in February 1918. Owing either to official neglect or the inclement weather, no steps appear to have been taken to save any part of the ship. She lay sloping to leeward, and so received the full fury of the northern winter winds. What a time they must have had of it! How the waves must have laughed like fiends as they dashed themselves against such a noble prize! Here, at last, was something on which they could wreak their vengeance for the innumerable rebuffs they had received at the hands of the Old Woman. How they must have screamed aloud in their glee as they battered to match-wood the noble decks, rising one above the other! These, however, must have served merely as *hors d'œuvre* and *entrées*. How about the more substantial courses? Figure to yourself the great funnels, through which a fair-sized trawler might pass. Gradually, as one tide succeeded another, as the angry sea lashed itself incessantly against them, one stay after another would be broken, and add to the general din by flapping against the hollow funnels. At last the funnels themselves would fall into the angry depths, with a splash that must have sounded even above the roaring of wind and sea. What chaos and pandemonium must have raged on and about that miserable ship! The waves would surge through cabins and doorways with a hiss, to be followed by a long-drawn sigh as they retired to gather themselves for a fresh assault.

For seven months the *Aurania* had been battered about by wind and tide when I set eyes on her. Only her bows were out of water now. Her decks, except at the bows, were all gone, and the rocks were littered with wood and spars. Barnacles clustered in millions on the winches and the great anchors. Slimy emerald-green seaweed grew on the erstwhile gleaming

decks. Somewhere about amidships there sprawled across the wreck what looked like a huge python—on examination it proved to be only one of the ship's davits. It alone weighed nearly three tons. On the foremast there still hung the brass bell bearing the ship's name. Numerous broken stays flapped about in the wind. Some five or six hundred feet away showed a little above the water the remains of the stern. The unfortunate vessel made a pitiable picture. Over her, and keeping out the sun, hung the Old Woman, throwing, as it seemed, her baleful shadow over her prey. The cormorants hardly ceased to stretch their wings and preen themselves in recognition of our approach. From the wreck itself issued the greedy sound of lapping water. The insatiable sea, having gorged itself on the flesh and entrails of the *Aurania*, was still greedy for more, and even on this calm morning was nibbling at the carcass.

I had come far and been at some pains to visit the wreck; yet, now that I had arrived, it seemed almost a sacrilege to disturb her solitude. Was she not even to be allowed to die unseen of the eyes of men, in the desolate spot she had chosen, unaided, when she fled northward, with a great gaping wound in her side? An atmosphere of permanent fixedness seemed to pervade everything. The Old Woman, of course, had sat there from the birth of the world, and would doubtless remain until the crack of doom. Even her offspring of petrified monsters, lying at her feet, although many æons younger than their dam, had forgotten whence they came. The cormorants, albeit the individuals were continually changing, had become one with their surroundings through the association of many centuries. The sea was there,

immutable but ever-changing. And now this new feature had entered into the scheme of things. Seven months of storm and rain might be a mere trifle in the history of the Old Woman, but to the *Aurania* it was an age, and she now fitted into the landscape and seemed to have become a part of her surroundings. Yet, in the nature of things, it could be but a temporary place she occupied. All too soon the sea would complete its work, and nothing would be left above water to show where the ship lay—only below would the partans and the lobsters rejoice in fine breeding-beds, and the great rock-cod find a pleasing labyrinthine maze through which to wind their finny way.

Sadly, therefore, I climbed on board and smoked my pipe, revolving in my mind many things—things spoken and things unspoken. Even as I smoked, the wind rose and the rising tide rushed in and out through the great anchor-winch. Clambering into the trawler, I left the *Aurania* to desolation and the Old Woman.

The ensuing winter saw the final break-up and total disappearance of all that was left of the liner. Her end was probably that of many another fine ship during the war; but the bid she made for safety, after being torpedoed, almost makes one think that Fate had intended her for a longer life. That for the space of ten days a ship of this size should be able to career about in home waters, unobserved by a single individual, at a time when every ship that sailed was on the alert for enemy craft, seems almost incredible. It is true that the weather was very bad at that time. Yet, when the prize was so great, when the necessity was so compelling, when so little was wanting to secure safety, it is hard not to think that something might have been done which was left undone.

THE PARTS MEN PLAY.

By ARTHUR BEVERLEY BAXTER, Author of *The Blower of Bubbles*, *Merrie Gentlemen*, &c.

CHAPTER VIII.—INTERMEZZO.

IT was several months later—May 1914, to be precise—when Austin Selwyn made the determination, common to most men, to remain in for an evening and catch up in his correspondence.

After the manner of his species, he produced a small army of letters from various pockets, and spreading them in a heap on his desk, proceeded to answer the more urgent and postpone the less important to a further occasion when conscience would again overcome indolence. For an hour he wrote trivial politenesses to hostesses who had extended hospitality or were going to do so; there was a reply to a literary agent, one to a moving-picture concern, an answer to a critic, and a note of thanks to an admirer.

Having disposed of these sundry matters, he sat

back in his chair and read a long letter that had been enclosed in an envelope bearing the postage-stamp of the United States of America. At its finish he settled himself comfortably, lit a cigar, and, squaring his shoulders, wrote a reply to the Reverend Edgerton Forbes, rector of St Giles' Episcopal Church, Fifth Avenue, New York:

'LONDON, May 12, 1914.

'MY DEAR EDGE,—I've been supplying your friend the Devil with all sorts of cobble-stones recently, but, my dear old boy, if I had written you every time I intended to, you would have had no time to prepare those knock-out sermons of yours.

'In your letter you hint at possible heart

entanglements for me. Do you not know that to a writer all women are "copy"? Even when he falls in love, your author is so busy studying the symptoms that he usually fails to inform the lady until she has eloped with some other clown.

'I must admit that you were partly correct in your surmise. I almost fell in love last November with a girl who invariably angered me when I was with her, but clung to my mind next day like an unfinished plot. I saw her quite frequently up to February, when I went to the Continent, but have not called on her since my return.

'I met her first at her mother's town house, where there were several people who admitted their greatness with an aplomb one was forced to admire. This girl sort of sat there and said nothing, but her silence had a good deal more in it than some of the talk. We had our first chat that night by the fire, next morning went riding in Rotten Row, and had dinner together the same night. Fast travelling, you say? On paper, yes; but actually I don't know the girl any better now than the night I met her. She's a strange creature; self-willed, fiery, sweet, and sometimes as clever as your Ancient Adversary. But friendship with her makes me think of the days when I was a kid. My great hobby was building sky-scrapers with blocks, and very laboriously I would erect the structure up to the point when "feeding-time" or "washing-time" or "being shown to the minister" used always to intervene. When I returned, the blocks had always fallen down. Well, friendship with Elise (pretty name, isn't it?) is not unlike my experience with the blocks. You can leave her, firmly convinced that at last you are on a basis of real understanding; and two or three days later, when you meet her again, you find all the blocks lying around in disorder. Instead of a friend, one is an esteemed acquaintance. The only way to win her, I suppose, would be to call at dawn and stay until midnight. It would be a bit trying, but I get awfully "fed up" (as they say over here) with being constantly recalled to the barrier.

'Of course, you old humbug, I can see you pursing your lips and saying, "Does Austin really love her? If he did, he would be unable to see her faults." It's an exploded theory that love is blind. Good heavens! if a man in love can see in a girl beauty which doesn't exist, is there any reason to suppose he will be unable to see the faults that *do*?

'But, candidly, I don't think I am in love with this young lady. I might be if I were given half a chance, but then emotional icebergs were always my specialty. I meet a dozen girls who treat me with a tender cordiality that is touching; then there comes into my course one who expresses a sort of friendly indifference, and there I stay scorching my wings or freezing my toes— whichever figure of speech you prefer.

'She makes me think of a painting sometimes,

one that changes in appearance with the varying lights and shadows of the sky. But, Edge, given the exact light that her beauty needs, she is a masterpiece. In some strange way her personality has given me a new pleasure in Corot and Diaz. It is difficult to explain, but it is so. I feel my powers of description are inadequate really to picture Elise to you. She is truly feminine, and yet when she is with other women her unique gift of personality makes them *merely* feminine. "Lordy, Lordy," as a nigger of mine used to say, "dis am becomin' abtuse."

'As a matter of fact, the girl is a result of conflicting elements of heredity. I haven't met her father, but I gather that he is a good old Tory of blameless respectability, and has a deep-seated disbelief in evolution. On the other hand, the girl's mother is rather a buxom and florid descendant of a vigorous North of England family, the former members of which, with the exception of her father, were highly esteemed smugglers. The lady's grandfather, Elise tells me, was known as "Gentleman Joe," and was as adventurous a cut-throat as a small boy's imagination could desire.

'Well, Mr Parson, you can imagine what happened when these conflicting elements of heredity were brought together. In the language of science, there was one negative result and two positive. The first-mentioned is a son Malcolm, whom I have not met. He has a commission in the cavalry, is a devil at billiards, can't read a map, and rides like a Centaur.

'Of the positive results it seems to me I may have already mentioned one—Elise. The other is Richard, the tragedy of the family. Poor Dick was practically kicked out of Eton for drunkenness when he was about fifteen. For the past year or so he has been at Cambridge, but he got in with a bad set there, and after several warnings has been "sent down"—or, in ordinary language, expelled. It appears that the old combination of "booze" and women got the better of him, though there's something oddly fine about the fellow too. He was hitting an awful pace at Cambridge, and when he tried to pass off a fourth-rate chorus-girl as the Duchess of Turveydrop, the axe descended. As the masquerading duchess was rather noisy and very "elevated," you can see that there must have been complications.

'Of course, his governor was furious, and, settling a very small allowance on the poor beggar, turned him out of the family home, and forbade him to ever darken, &c., &c. (see, split infinitive and all, any "best seller" of a few years back).

'Does this seem at all incongruous to you? These so-called aristocrats bring a son into existence, and, providing he's a decent-living, rule-abiding chap, he is sheltered from the world and kept for the enriching of their own hot-house of respectability. But—if one of them upsets the ash-can and otherwise messes up the

family escutcheon, the father says, "You have disgraced our traditions. Get thee hence into the cold, outside world. After this you belong to it."

'Damned generous of paterfamilias, isn't it? Only, as one of the cold, outside world, I can't help wondering why, if Milord is going to keep his good apples for himself, we should have to accept the rotten ones.

'Concerning Cambridge—I spent a week-end there recently with Doug Watson of Boston, who is taking Engineering. Cambridge is quite a little community, as separate from the rest of England as the Channel Islands. On the Saturday evening I was there Watson took a punt, and with considerable dexterity piloted me along the Cam, with its green velvet banks and overhanging trees. The river is an exquisite thing, and there was a sensuous drowsiness in the beauty of the hour before dark.

'The lawns from the backs of the colleges slope down to the river, and as we passed along we noticed group after group of students drinking coffee made in percolators in their possession. There was something almost pastoral in the sight of those young Britishers in such complete repose. Perhaps I should have enjoyed it all without question if it had not been that, a week before, I had visited a poor little Non-conformist preacher who labours on an empty stomach to a little congregation in a chain-making district. Edge, the sights I saw there were not good for any man to see and remain quiet. Women work at the fires when pregnant, and fuddle themselves with beer at night; the men are a shiftless lot, who spend their lives hand-in-hand with poverty and think only of beer, "baccy," and loafing. You know I'm no prohibitionist, but I hate to see beer the goal of men's ambitions. In one school there was a class with forty "backward" children. That's the kinder word, Edge, but the real one is "imbecile." Think of it—forty human destinies that must be lived out to a finish! They tell me that conditions are improving there. I hope so, in Heaven's name.

'It was that visit I had in mind when punting along the Cam. A man is a fool to pit his little mind against so vast and wonderful an edifice as a great university like Cambridge, but one thought which occurred more than once to me was whether or not a man can be considered educated if he be ignorant of human misery existing beyond the college gates. In the Scottish universities the Professor of Latin is called Professor of Humanity. I wonder, Edge, if the time is not ripe for a chair of Humanity in a wider sense in all universities.

'On Sunday we went to one of the churches, and, with eleven others, managed to present a formidable congregation of thirteen. The preacher's prayer, which he read, was a superb piece of work. He started off with the King and

the Royal Family, passed on to titled and landed gentry, after them the higher orders of the clergy, leaders of the navy, the army, and all those in more or less authority, then the lower orders of the clergy, and after several categories I have forgotten, he reached the commoners, and (in an appropriate tone of voice) hoped we should live in peace, one with another.

'Think of it, Edge, in this enlightened age! I wanted to go up to him after the service and ask him why he had left out the minor poets, but Doug stopped me—which is perhaps just as well. He might have added a prayer for Americans after the commoners.

'Sometimes I think that the English Church is losing its grip. I don't mean that snobbery of the kind I have described is common, but in the development of Church character it seems to me that the truth of Christ's birth into a humble walk of life is drifting steadily farther from the clerical consciousness. The timid snobbery which permeates so much of English life, and reaches its wretched climax in the terms "working class" and "lower classes," finds condonement in the ranks of the clergy. Even in its humorous aspect, when Mrs Retired Naval Officer starts to swank it over Mrs Retired Army Officer (senior service, dear boy, y'know), and so on down the line, the local rector too often takes an active part in seeing that the various grades are punctiliously preserved. Of course, there are glorious exceptions to all this, and they are the men who count.

'I suppose at home we are just as bad, and that even so democratic a preacher as yourself doesn't take supper on Sunday night with the poorest parishioner. Perhaps living in a strange country makes a man see many things he would not notice in his own.

'To finish with Cambridge—we joined a party of two large punts on Sunday afternoon, and with about twelve college chaps and local (approved) girls we went for a picnic up the river. The girls were fairly pretty and terrifically energetic, insisting upon doing an equal share in the punting, and managing to look graceful while they manoeuvred the punts, which were really fair-sized barges. And when we reached the picnic-place, they made all the preparations, and waited on us as if we were royal invalids. Bless their hearts! Edge, to restore a man's natural vanity, commend me to life in England. Coming home we played the gramophone, and, with appropriate flirtation, floated nearly the whole way to the holding of hands and the hearing of music.

'And, theologian as you are, if you deny the charm of that combination, I renounce you utterly.

'Just one more Cambridge thought. (This letter has as many false endings as one of your sermons.) There were quite a number of native students from India in attendance, and I noticed that these men, many of them striking-looking

fellows, were left pretty much to themselves. The English answer when spoken to, and offer that well-bred tolerance exerted by them so easily, but the Indian student must feel that he is not admitted on a footing of equality. I'm not certain that the dark races can be admitted as equals—but what effect on India will it have if these fellows are educated, then sent back with resentment fermenting their knowledge into sedition? It may be another case where the Englishman is instinctively right in his racial psychology; or, again, it may be a further example of his dislike to look facts squarely in the face.

'Of course, we have our own racial problem, and have hardly made such a success of it that we can afford to offer advice.

'Well, Edge, this letter has run on to too great a length to permit of any European treatment. That will have to wait. Of course, I have paid several visits to Paris, and understand as never before the saying: "Every man loves two countries—his own and France."

'Edge, why is it that people who travel always have the worst characteristics of their nationality? On the Continent one sees Englishmen wearing clothes that I swear are never to be seen in England, and their women so often appear angular and semi-masculine, whereas at home—but then you know what an admirer I am of English women. And our own people are worse. Tell me: at home, when a gentleman talks to you, does he keep his cigar in his mouth and merely resonate through his nose? Or is that a mannerism acquired through travelling?

'But enough, old boy. This has covered too vast an acreage of thought already. Oh yes—about my writing. I have been doing very little recently, but can feel the tide rising to that point where it will of necessity overflow the confines of my lethargy. I have had the honour of meeting several of the foremost writers here, and there is no question about it,

they are doing excellent work. But I wish that I could feel a little more idealism in their work. The whole country here is parched for the lack of Heaven's moisture of idealism. People must have an objective in their lives, and the Arts should combine with the Church in creating it.

'Of course, there is an amazing amount of drivel written over here, most of which, I think, would never get past the office-boy of an American publication. The English short story and the English music-hall are things to be avoided.

'Before I end, have you seen Gerard Vanderwater recently? I heard that he joined the diplomatic service at Washington after leaving college. I often think of him with his strange pallor, but suggestion of brooding strength. Did it ever strike you that every one respected him, and yet he really never had a close friend? It always seemed to me that he carried about with him a sense of impending tragedy. Find out what he is doing, and let me know.

'Well, old boy, in another few months I shall pack up and return to America, and once more woo the elusive editor. I am looking forward to sitting by your fireside and, through the cloud of tobacco-smoke, weaving again our old romances. I am really proud of you, Edgerton, and know that you must be a tremendous power for good.

'A letter any time addressed c/o The Royal Automobile Club, Pall Mall, will find me.—As ever, your old chum, AUSTIN SELWYN.'

The writer addressed an envelope, inserted the letter, sealed and stamped it, then yawned lazily. Gathering his outgoing correspondence and the old letters, he took his hat and sauntered into the street, conscious of having done his duty—also that he had unearthed some thoughts the existence of which he had not suspected beneath the surface shrubbery of everyday existence.

(Continued on page 164.)

ICELANDIC VOLCANOES.

THERE are few portions of the earth's surface which exhibit more abundant proofs of intense volcanic activity than Iceland.

This island, which has an area of about 40,000 square miles, is composed almost entirely of rocks of volcanic origin. Vast quantities of volcanic debris and numbers of craters (the mouths of which have been wholly or partially destroyed by mere erosion) bear witness to the eruptions which must have taken place long before the foot of man trod this land of ice and fire; and still the activity of the Icelandic volcanoes seems by no means exhausted.

In some parts of the island volcanic cones of various dimensions can be counted by the hundred, but most of them are extinct. We

know with certainty, however, that twenty-three or twenty-four of them have been active in historic times, and doubtless a good many other eruptions have taken place which have not been observed—more especially in the inner tracts which had not until recently been explored. In all we know of 130 active and extinct volcanoes, with at least a couple of thousand craters.

These volcanoes occur in groups, between which a certain connection can sometimes be traced. Usually they stand across rifts in the mountain-ridges, which in the south run from south-west to north-east, and in the north from north to south. In the north-western and eastern parts of the island there are no volcanoes. The most important groups are (1) the Reykjanes group, on

the peninsula of that name; (2) the Hekla group; (3) the Laki group, to the south of Vatna Jökull; and (4) the Mývatn group, in the north.

The most famous of the Icelandic volcanoes is undoubtedly Hekla. It is a mountain composed of alternate layers of lava and tufa which have been formed during various eruptions; but its base is in a mountain-range which runs in a north-easterly direction, and upon which there are a number of other volcanic cones. The formation of all these cones is due to a great eruptive rift which runs lengthwise through the aforesaid mountain-range.

Hekla has been active on a number of occasions in historic times. Streams of burning lava have descended its sides, and dense showers of ashes—accompanied by violent earthquake shocks—have caused widespread destruction. The volcano's last eruption, which took place in 1845–46, lasted for seven months, and it was computed to have discharged during that period not less than 432 million cubic metres of lava. The column of ashes rose to a height of four thousand metres, and portions thereof were borne by the wind to the continent of Europe. Even at noon the darkness was such that people had the greatest difficulty in finding their way home; the hot ashes dammed up the rivers and raised the temperature of the water almost to boiling-point; vivid and constant flashes of lightning lit up the scene; and, throughout, loud thunderings and explosions came from the mountain. The devastation wrought on this occasion, however, was slight as compared with that done by the eruption of Hekla in 1766.

To the south of Vatna Jökull, the most extensive glacier in Europe, there is another great volcanic tract, the so-called 'Laki' region, where in the eighteenth century there occurred the most terrible outbreak ever recorded in the annals of Iceland. Here there is a rift some fifteen miles in length, running in a north-easterly direction, which is closely studded over with craters, large and small; and it was from these that, in 1783, came the eruption which caused a catastrophe from which the island did not wholly recover until the middle of the following century. The lava flowed forth in two huge streams—one of which attained a distance of fifty-five, the other of thirty, miles—and covered an area of more than two hundred square miles of country. According to the calculations of the Norwegian geologist Professor Helland, Laki must on this occasion have vomited forth about fifteen milliard cubic metres of lava and some three milliard cubic metres of ashes and scoria. The lava-streams destroyed forty farms, and the falling ashes ruined the grass pastures for several years throughout a great extent of country. After the eruption people and animals were attacked by severe illnesses, caused, no doubt, by the poisonous gases and vapours with which the atmosphere was impregnated; and 18 per cent. of the population

succumbed. In 1783–84, 11,000 cattle, 190,000 sheep, and 28,000 horses—in all, two-thirds of the island's entire stock of animals—died.

On the peninsula of Reykjanes, to the south of Reykjavík, the capital, there is a volcanic area within which, according to Professor Thoroddsen, the Icelandic expert, there are thirty volcanoes and seven hundred craters. No such destructive outbreak as the one above referred to can be said ever to have emanated from this group, but the vast tracts of lava bear witness to violent eruptions in prehistoric times.

Of all the volcanic tracts of Iceland, however, the one at Mývatn is perhaps the most interesting, comprising as it does, within a comparatively limited area, volcanoes of so many different types and sizes. On the little island of Geitey alone there are ten craters; at least fifty cones rise above the surface of a tiny lake; and owing to the many hot springs which discharge into it, the temperature of the water is very high—so high, indeed, that the vegetation here is more luxuriant than at almost any other place in Iceland.

Notwithstanding the large number of volcanoes in this region, only one eruption has taken place in it in historic times, but it lasted off and on for five years—from 1724 to 1729. In 1729 the lava descended towards Mývatn and destroyed the hamlet of Reykjald, together with the parsonage. Close to the church, however, the stream of molten rock divided, and the sacred structure escaped uninjured. This the people attributed to special intervention on the part of Providence; but the fact is that the building had been constructed on higher ground, and now it stands in a green oasis in the middle of the black lava. When the lava reached the lake a great battle took place between the burning masses and the water. The battle lasted a long time, but in the end the lake came off victorious.

In addition to the volcanoes belonging to the groups referred to above, there are others which stand apart and which have also been responsible for titanic discharges. Thus we have Askja, the greatest volcano in Iceland, situated in the middle of the great lava desert Odádhraun, from which, in 1875, a violent eruption took place; Katla, in Mýrdals Jökull; Oeraefa Jökull (6500 feet), in the south; and many others.

The last great eruption in Iceland occurred in the autumn of 1918, but owing to the convulsions from which Europe was suffering at the time, it attracted comparatively little attention.

In October 1918, after having lain dormant for a period of nearly sixty years, Katla began to exhibit symptoms of activity in the shape of earthquake shocks in its vicinity, and on the 12th of that month an enormous column of mingled dust and steam shot up from the mountain. From observations taken at Reykjavík, the height of this column was estimated at 37,000 feet. Every now and again it was rent by vivid flashes of lightning, and these served

in some degree to mitigate the gloom which shrouded the entire district even on days of cloudless skies. At Vik, a village of some three hundred inhabitants, sixteen miles from the crater, the darkness was so great that lights had sometimes to be kept burning throughout the twenty-four hours. Although Reykjavík is more than a hundred miles from Katla, and several mountain-ranges intervene, not only was the cloud-like pillar visible from the town, but the streets were covered with a layer of volcanic dust sufficient to show clearly the imprint of footsteps. The wireless installation at the capital was at times subject to great disturbance, as also was the telephonic connection with Vik. In the district of Medalland, some twenty miles from the crater, four farms were swept away by the floods which accompanied the eruption. The people from these farms escaped with their lives, but they lost nearly everything else, including most of their cattle, horses, and sheep. The bridges over the rivers were destroyed, and in other districts many farms were laid waste by the fall of dust and ashes. To the east of Cape Hjørleifshofdi, where one of the flood-channels had its outlet into the sea, a new promontory was formed four miles long and one broad. The new land was strewn with glacial fragments, some of them a hun-

dred feet square, while similar fragments could be seen drifting in the sea along the coast. It is estimated that the weight of material which has gone to form this addition to the area of Iceland is something like two hundred million tons.

The meaning of the word Katla is 'the witch.' An atmosphere of mystery seems, indeed, to surround this mighty volcano, which has slept for so long beneath the everlasting snows of the Mýrdals Jökull. The great desert of Mýrdals-saendur, which lies beyond the intervening glacier, and which is mainly composed of sand and gravel discharged from the volcano, was in olden times a rich and fruitful district; but the witch-woman Katla revenged herself on the country-side by leaping down the crater and thereby causing its first eruption.

There have been twelve or thirteen outbreaks of Katla in historic times—the first in the year 900, the last but one in 1860. Those of 1625, 1660, and 1721 would seem to have been the most violent. In 1755, when Lisbon was destroyed by an earthquake, there was an eruption of Katla which caused great floods. Travellers who happened to be crossing the Mýrdals-saendur saved their lives with much difficulty, and the water in the rivers attained a height of more than six hundred feet above the ordinary level.

THE PICTURE.

By J. PARSON.

I.

WHEN Phillimore took up his abode in the little city of St Damian's, he did so because to build up a new dental practice it is necessary to find a public, and a *pied-à-terre* that will not lead to unnecessary expense. The house in the Close was cheap and convenient, which cannot always be said of extremely old and picturesque dwellings. It was, therefore, with justifiable buoyancy that he began his work.

He was an ordinary young man, caring not in the least for the antiquity of the Close clustering around the cathedral, nor marking its unusual dedication. Perhaps he did not even know that St Damian was himself a member of the medical profession; he knew only that he wished to build up 'the best local dental practice,' and to appeal to the dignitaries of the place. He therefore hailed the advent of Minor-Canon Chetham as a good omen.

Minor-Canon Chetham, who was also the chapter librarian, was a little middle-aged man, looking much older than he really was. After Morning Prayer—that is, at eleven o'clock—it was his custom to amble past the dentist's house towards the little turning that led to his lodging.

One bright morning he came out of the big south door just as a motor-cycle raced at high

speed round the west front. The rider was going with less care than he would have exercised in the Metropolis. Too late Mr Chetham saw the thing approaching—he was already in its path; it swerved, and so did he, the same way; it tried to pull up, emitted a fearful hoot, and the next moment its rider and Minor-Canon Chetham were sprawling in the road. The cyclist, being the first to recover, and seeing a small cloud like the shape of a constable in the near future, took to his machine and rode away. But Mr Chetham sat up on the grassy roadside, looking and feeling very sorry for himself. He was aware that somebody helped him across the way into what he took to be a doctor's consulting-room. But the house was Phillimore's, and the policeman, who was managing the show, sent a lad out for Dr Shaw, who happened to be passing. Dr Shaw, as it chanced, was the minor-canon's medical adviser, and the attentions of the crowd and of the policeman were, therefore, soon dispensed with. The patient's chief injury, besides shock and a few bruises, seemed to be that one of his teeth had disappeared beyond recall. Further examination showed that another, which had seen long service, was fit only to be extracted. Dr Shaw intimated that it might as well come out there and then.

'Possibly,' Phillimore suggested, in his best

professional manner, 'Mr Chetham would prefer to consult his usual dentist?'

Mr Chetham, it appeared, had no use for such a retainer; and at last, with a bad grace, he consented to the kindly collusion of laughing-gas with Phillimore's strong right wrist, but not 'there and then.'

II.

At the appointed hour the minor-canon allowed himself to be smothered in the latest approved manner known to Dr Shaw, and awoke at last to a fractious consciousness.

The first thing he did was to sit upright and look indignantly over his shoulder. 'Who's there?' he demanded sharply.

Phillimore turned in surprise, and the doctor answered coolly, 'There's not a soul here but us three, Chetham. You've been dreaming; it often takes people that way.'

Mr Chetham looked over his shoulder at the door. 'Some person came in,' he said with unwonted energy, 'and walked across to the fireplace; I heard the lock click distinctly. I may have been under the influence of the anæsthetic, but I was not dreaming.'

Shaw flattered himself that he knew the obstinacy of the English clergy in little matters, and stood unruffled. Phillimore, with a puzzled face, walked slowly to the door. He opened it suddenly, then shut it again with a jerk. There was no click.

The minor-canon rose, and Phillimore helped him with his overcoat. As the parson reached the door he turned with a last shot: 'I heard foot-steps coming along the corridor; then some one stopped, opened the door with a click, entered the room, crossed to the mantelpiece'—— He broke off. 'That's a very curious picture,' he said thoughtfully. 'May I ask its history?'

Phillimore explained that it belonged to the house, and that he had found it there.

'What's it meant to be?' asked Shaw.

'I haven't the least idea,' admitted the dentist. 'I had a patient the other day who knew this house thirty years ago; the picture was here then, and tradition connected it with St Damian.'

Mr Chetham looked at the old painting with more attention, stroking his tender jaw. 'It looks like the early Spanish school,' he said, 'but I am not much of a judge in these things.'

With that he really did go, and the two others were left alone.

'You never know how a patient will take things,' said Shaw disgustedly. 'In my experience they don't dream of immediate surroundings.'

The doctor departed, and Phillimore dismissed the incident from his mind.

III.

St Damian's was a small place, but the new dentist soon began to find his work almost as plentiful as he had hoped.

Among the cathedral clergy was a certain Canon Boscawen, appointed a few months before. He was a widower with one daughter, who was reputed to be really beautiful, and the fact that her wardrobe was supplied by London *modistes* lent colour to the belief. During August, when her father was in residence, a sister of his, a certain Aunt Matty, was staying with her. This lady suggested that, if Miss Boscawen objected to toothache, she had better consult a dentist, and together they appeared in Phillimore's surgery. Aunt Matty explained that her niece had been a patient of a certain practitioner in Wimpole Street. Phillimore proceeded to scan the great man's work with criticism born of another hospital. Finally he pronounced sentence: though one tooth could be filled, another should be extracted.

He crossed to the writing-table to turn up his engagements. 'I can give you to-morrow at twelve,' he said, 'or Thursday, same time.'

He stopped abruptly. As he stood at the table his hand rested negligently on the polished border round the leather. There was the reflection of his white drill coat-sleeve, and of the flesh-tints of his left hand lying close against the mahogany—but beyond this, he saw, in the depth of the dark wood, a pale face looking at him. He turned sharply to make sure that neither of the ladies had left the other end of the room. When he looked again the vision had disappeared. With unruffled nerve, however, he thrust the subject to the back of his mind till a more convenient season.

The appointment was made. Phillimore inquired the name of Miss Boscawen's medical attendant. It appeared that they had not yet chosen from among the many brass plates that adorned St Damian's. Phillimore was acquainted with only two of the practitioners in the city. One was old Dr Fearon; he had a good family practice, and a tremendous stock of after-dinner stories. Of Dr Shaw Phillimore knew little, but he believed him to be conscientious and up-to-date, and, besides, more likely to introduce patients to a new dentist than was the older man. He therefore gave Dr Shaw's address to Miss Boscawen.

IV.

At twelve o'clock on the following day Daphne and her aunt appeared again. The girl looked charming in lilac linen and a leghorn hat wreathed with purple clematis, which she gave into her aunt's keeping as she seated herself comfortably in the green-velvet chair. Her auburn hair sank against the head-rest; her purple suede shoes, which had come from no shop in St Damian's, were wedged against the foot-board. Then came a momentary blank, a struggling dream, from which she woke to a gasping consciousness. She seemed to be still dazed. But in a little while she sat up and

deliberately turned her head, looking over her shoulder round the room.

'There's nobody here?' she said, speaking to the doctor.

'There's no one here,' he replied quietly.

'You've been dreaming, darling,' interpolated her aunt.

Miss Boscawen sank back dizzily. 'I don't believe,' she said relentlessly, 'that I've been unconscious at all.'

The dentist looked hurt, while the doctor answered coldly, 'You were quite under, I should say. You went about the right colour, and so on.'

But Daphne looked unsatisfied. 'Somebody opened the door with a click,' she said; 'I couldn't see precisely who. A figure went across the room to the fireplace, and then turned and began to look at me; but before it turned its face so that I could see it, I was so awfully frightened that I woke.'

For once in his professional life Dr Shaw was at a loss for words. For want of something better to do, he put his finger on the girl's wrist.

Phillimore looked annoyed. 'No one has come into the room since you arrived,' said he positively.

Daphne was unconvinced. 'I heard footsteps coming along the hall just there; then the steps stopped at the door, as I told you.'

'My dearest,' said Aunt Matty, in a tone calculated to implant an *idée fixe* in any mind—'my dearest, it was just a dream.'

A thought occurred to Shaw. 'Pardon my asking one question,' he said. 'Do you know Mr Chetham?'

'We have just met him, but only once, I think.'

Shaw wished he had not asked. 'I can only suppose,' he said, 'that you have had an unusual form of dream; patients do dream the weirdest things. I mentioned Mr Chetham,' he added lamely, 'because he is interested in such matters, and you might have discussed them with him.'

Miss Boscawen jabbed two amethyst pins through the crown of her hat; then she went to the mantelpiece, as if she had noticed the picture for the first time. 'Is it very old?' she asked.

'I believe quite old,' answered Phillimore unwillingly. 'It was here when I came.'

'Do you know the history of the house?'

'Practically nothing; the landlord couldn't tell me much, but from the deeds it appears that it was altered about 1795. It is said that a smuggler hanged himself here to square his conscience; but, of course, that's only a story.'

The girl shuddered with a half-pleasant thrill. 'Is the house haunted?' she asked.

'Of course not, dear,' interpolated her aunt. Evidently the good lady noticed Phillimore's uneasiness under this catechism. Perhaps also,

in her opinion, it is only the houses of the truly great that have any right to such distinction.

Daphne gave one more look at the picture, then turned reluctantly and followed her aunt out of the house.

When Phillimore returned, he found Shaw standing thoughtfully at the window.

'With your permission,' the latter began in his curt way, 'I intend to try a little experiment. We will get a third person—that will be better than either of us—to sit in that chair, let himself be put under the influence of nitrous oxide, and tell us his experience. Of course, we must say nothing of what we expect.'

'Of what we expect?'

'It is more than a mere coincidence, I believe. At least, we shall have an interesting experiment.'

'I have no objection,' assented Phillimore. 'Whom do you suggest?'

'A colleague of mine at the hospital, Bruce Cathcart. Do you know him?'

'Not at all.'

'So much the better. He'll be absolutely unprejudiced in every way.'

v.

On the day appointed, a quarter of an hour before the time fixed, Shaw stalked into the surgery. There was an air of almost festive expectancy about the room. If you think of it, to a man who has spent two months in hard work on some days, and as near as may be to the pretence of hard work on others, a psychic experiment comes as a welcome diversion, even though he has no belief in spooks. On this point Shaw touched at once.

'Have you ever had any psychic experience yourself?' he inquired.

'Lord, no!' was the disdainful answer; then the speaker stopped with a jerk, remembering. 'As a matter of fact,' he resumed slowly—and described the vision in the writing-table. Shaw nodded thoughtfully, and looked at the place, but there was nothing spectral to be seen.

'Did any other of your patients make any complaints?'

'No; as it happens, I have had no other extractions. One lady did complain of an icy draught, though the door was shut, and the windows too, for it was that terrifically rainy day. Another insisted that the door-handle clicked.'

Shaw examined the lock in silence. 'It seems in good order,' he remarked.

'Quite; my landlord fixed a new one just before I came.'

'What did he do that for?'

'I suppose the old one was defective, but I didn't inquire.'

'You have arranged we shall not be disturbed?'

'My housekeeper has just gone out. She has a niece at the other end of the city who is, fortunately, ill, so I could get rid of her without inventing an excuse.'

'Then it won't be her footsteps we shall hear.'
'Certainly not.' Phillimore spoke carelessly, but he looked disturbed; the most matter-of-fact among us is not proof against the kind of insinuations Shaw had been making, particularly when they concern our own demesne.

VI.

Precisely at the hour named the third party to the experiment made his appearance. He hailed from a London hospital that prided itself on its urbanity and its scientific mind. When Shaw performed a curt introduction, he bowed ceremoniously and professed his entire willingness to further the scheme afoot. It was merely explained to him that Phillimore, for reasons known to Dr Shaw, desired to place some unprejudiced person under the influence of gas, and that Dr Shaw had suggested his suitability. The 'medium' seated himself in the chair, fixing his feet on the foot-board and fingering the chair-arms, and announced that he was quite ready.

It seemed to be a perfectly normal example of anæsthesia. Both investigators were on the alert. Shaw moved across to the writing-table, paused there a moment, and returned with an impassive face. He wrote a few words on a two-inch-wide slip of paper that he habitually carried for the day's notes. Then he waited.

Bruce-Cathcart opened his eyes and looked at the two faces near him; clearly he expected something else. He sat up abruptly and looked steadily over his shoulder. He rose and went to the door; obviously the scientific mind was in the ascendant. He tried the door; it was locked. The dentist turned the key, and the momentary delay seemed to restore the medium's equilibrium. He looked outside, then returned to the surgery.

'Let us go into the other room,' said Phillimore. 'There is a fire there—it will be more cheerful this chilly day.'

The others acquiesced. As the dentist turned to shut the surgery door, he looked round the pleasant room with a feeling of something like repugnance.

'I suppose,' began Bruce-Cathcart, 'you want me to tell you about my curious dream; that is obviously why I am here.'

Shaw nodded; and Bruce-Cathcart continued: 'It was quite normal at first, though there was no sound of rushing water, which, in some form or other, I always have. There came the usual blank. Then I imagined myself perfectly conscious. You were standing at each side of me. Suddenly I heard footsteps in the hall. The door-handle clicked, and the door began to open slowly. I felt a distinct draught at the back of my head. I sat up and looked over my shoulder. The door was opening. A figure began to cross the room—a man, to judge by the gait, and by the left hand, which was hanging at his side, and was distinct against the dark habit.

He looked like the picture of an old monk with his head covered by a sort of hood. He crossed the room to the mantelpiece, and putting up his hands, seemed to try to unfasten the picture. Apparently he couldn't manage it, for he turned. I caught a glimpse of his face. He had a rather handsome face, with dark Moorish eyes. I think I should know him again.'

The speaker paused, and Shaw interposed, drawing a paper from his pocket.

'Now,' he said, 'I will tell you what I saw when I went to the writing-table. I looked at the polished mahogany surrounding the leather top—by the clock on the mantelpiece it was one minute before you came round. I wrote at once on this piece of paper: "In the wood appears a face over my shoulder; it is a pale face, with clear-cut aquiline features and steady dark eyes." Evidently we were struck by the same vision.'

Phillimore looked uneasy. 'If the tale gets about, it will ruin my practice.'

'There is no reason in the world why the story should go further,' Shaw responded decisively. 'Very few people know anything; we three and the minor-canon are the only ones interested.'

'I have been expecting to hear from him,' said Phillimore. 'He very kindly promised to trace for me, if he could, the history of this house. In the cathedral library there seem to be a good many deeds and so on connected with these old houses in the Close.'

During the next week Phillimore followed his usual routine with increasing work. If any rumours had travelled, they had an opposite effect from that he had feared. His two medical acquaintances he had not seen since the day of the séance. As for Mr Chetham, the reason of his silence was bruited over the city: he was down with influenza. But one evening Phillimore opened a note from him. After acknowledging his correspondent's kind inquiries, the writer explained that, though much better, he had been too ill to do more than glance at certain papers bearing on the subject of the old houses in the Close. These, unfortunately, were not catalogued, and he had put them aside for further examination.

VII.

The third Saturday in September dawned with a gray cloud hanging over the cathedral, as if on purpose to show up the delicate sculpture on the great central tower. The masonry was of a local sandstone strongly impregnated with iron, and in no other light could its purplish-gray be seen to such advantage as when the sun was half-hidden behind an occasional bank of cloud. The air was much warmer than at the beginning of the month.

Phillimore, crossing the Close, was hailed by Dr Shaw, whose gray car drew up with a jerk. The appearance of the doctor reminded him of the mystery, and he pulled the minor-canon's

note from his pocket. 'I will go and see him to-night,' he said. 'I am glad he's so much better.'

The doctor looked up sharply. 'Haven't you heard?' he asked. 'I thought it was all over the city. He's gone.'

Phillimore started; the news seemed to hold more significance for him than that of the death of a mere acquaintance.

'Yes'—Shaw spoke more slowly than usual—'I saw him yesterday about five. He was writing letters—among them yours, probably, for he mentioned you, and remarked that he had hit on the track. He also said, by the way, that not a soul but himself knew what papers he had consulted or where they were. He seemed much better in every way, and now he has slipped through my fingers.'

'I had heard nothing,' said Phillimore.

As he passed the deanery a man stopped him with an apology, handing him a note from Bruce-Cathcart, asking Phillimore to meet the writer at the South door soon after six. There was only one 'South door' in the city, and at the hour named he found Bruce-Cathcart waiting for him with as much impatience as that gentleman ever allowed himself to show. The doctor led the way up the south aisle.

'When I had that curious experience in your house,' he explained, 'I felt certain of having seen that figure before. Yesterday it occurred to me where it was. Of course,' he added thoughtfully, 'the fact somewhat vitiates the experiment as such, because it is quite likely that others have seen it too. But even then the agreement of our dreams is very interesting—perhaps due to telepathy.'

They were now in the south choir aisle; it was here almost dark except where the great rose window cast a faint sheaf of light across the shrine of St Damian. This was a wonderful, ornate structure, erected within the sanctuary, but out of the straight line of the south choir screen, which at this point was carried out on three sides of a rectangle. Therefore it was possible for visitors to view three sides of the shrine from the aisle. It was a cenotaph, surmounted by a recumbent figure of St Damian; the left arm was folded, but the right was extended—probably the only example of that date extant. Between the thumb and the forefinger of the right hand was a small hole, still visible, by which the attendant priest might drop medals, to touch the relic and be returned, thus sanctified, to their owners. The nature of the relic was a subject of occasional speculation to local antiquarians. Some maintained that it was a lock of the saint's hair, some that it was a bone belonging to the right hand. The latter pointed to the fact that the relic was certainly close to the right hand of the figure; but this detail also supported the theory that the relic was a Damascene surgical instrument, or the saint's

pestle and mortar. Most claimed that the object, whatever it was, was still in existence. But the abbess of a neighbouring nunnery professed to have the real relic; certainly a human tooth, safely enclosed in a reliquary, was kept beneath the altar of her abbey church.

Of all these things Phillimore was profoundly ignorant. Bruce-Cathcart knew them only as a matter for local gossip; he was much more interested in the fact that the convent at present employed an ancient Roman Catholic medical man, and it was a matter for more or less silent conjecture who would be chosen to take his place when he should join the great majority of non-practitioners, whether by retirement or by death.

Relic or no relic, the shrine still stood in the cathedral, and much remained of its former magnificence. Some of the colour was left, and round the sides ran a series of paintings detailing the *acta sancti*. Upon these Bruce-Cathcart directed his electric torch. Among them was a scene depicting St Damian standing, looking towards the west, with his profile half-concealed by a black hood, and with his left hand hanging easily by his side.

'That,' said the doctor, 'is the person whom I saw in your surgery, and whom the others saw.'

Phillimore looked along the paintings. The same head was repeated in different positions—and it certainly bore a striking resemblance to the face that had looked from the polished woodwork of his writing-table.

'Then there's another thing I've noticed,' pursued the other. 'The third panel from that end doesn't fit exactly. The sacristan says he has never noticed it. I found it by touch at the lower edge, but you can see it if you move a little this way. My theory is that yours is the missing panel, and that this was restored from description and memory. You see, it is the same subject treated slightly differently.'

'It is partly a question of measurement,' said Phillimore. 'I wonder,' he added slowly, 'what Mr Chetham's researches amounted to.' He stopped abruptly; the speculation seemed scarcely decent with the minor-canon still unburied.

VIII.

They left the cathedral by the west door, stopping to look back along the lofty nave, with its effects of reflected light dimmed by the oncoming darkness.

'What is there to do?' Phillimore asked. 'The papers are practically inaccessible, though I shall, of course, make inquiries. It is out of the question to pay for research in the ordinary way. I don't even know who does that sort of work, or what they are paid,' he added vaguely.

Bruce-Cathcart was wiser on this point. 'It might mean a week's work,' he said; 'and, after all, what are you looking for? What would your landlord say?'

'It might,' said the dentist dryly, 'induce him to drop the rent, or sell the house at my valuation. It is far more likely to damage my practice.'

'In my opinion,' said the doctor, 'it's much better to let such skeletons alone. I've seen it again and again in private practice. After all, what have you really to complain of?'

But a word in this sentence set the dentist thinking, and that evening he went through the meagre evidence in his possession. If the house was not haunted in the usual sense, there was something odd about it. But what? He thought of the old-wives' stories that had come his way; they were tales of ordinary ghosts (he smiled at the adjective), or instances of *poltergeist* that had often been traced to the hysteria of a housemaid. There was nothing in his list parallel to this repeated dream. Yet was the influence in his house, whatever it was, responsible for dreams only? What of his own sight of the face in the writing-table, the face which had also been seen by Dr Shaw? But Shaw and he had not heard footsteps. He went into the hallway at this point and looked along the floor. There was nothing visible, except that it struck him that inlaid linoleum ought not yet to be showing signs of wear. There certainly was a slight depression in the surface at irregular intervals from the garden door towards the front of the house; and, oddly enough, the depression stopped at the surgery door. It was odd, too, though it had not struck him before, that, though the legend connected the picture with the cathedral, the dreamers had heard steps from the back of the house.

What was the connection between the garden door and that of the surgery? He stooped down, drawing his finger over one of the marks on the linoleum. Then he held up his head, listening. For, as if he had rubbed the magic ring, there came a slight vibration, and a sound, ever so slight, struck upon his ear. He drew back instinctively into the shadow of his dining-room; then he stooped again to catch any sound that came along the floor. He could not doubt his own steady senses; there was a faint step, not of a light foot, but like the memory of a regular, heavy pace. It disappeared as he listened, and, though he waited for some moments, he heard nothing more. 'Which rather proves,' he thought, 'that there is something in it. If it were my own nerves, I should still be hearing step after step.' He went to bed at last with a half-formed determination to ask Dr Shaw's help.

IX.

The doctor listened patiently to the story. Together they went over the chain of incidents, in themselves trifling, but, taken as a whole, perhaps significant. There did seem to be 'something' about the house, contained, perhaps, within it. Its topographical connection

appeared to be, as Phillimore thought he had worked out, between the surgery and the garden door. They looked at the latter carefully. There was nothing curious about it—no possibility of a *cache*, except beneath the step.

'Have the stone up,' said the doctor dogmatically. 'As you say, you want no publicity, nor the expense of research. Besides, what is there you could find that way? By all means have the stone up, and if there's nothing there, try the chimney. If you don't damage the structure, who's to mind?'

So, on the next Saturday afternoon, when the house was empty, the two men prised up the door-sill with some difficulty. It revealed a solid filling of builder's rubbish; but beneath this, closely packed in the subsoil, out of reach of the casual builder's man, and, as it happened, out of the direction taken by the modern drainage system, lay half-a-dozen lead-lined boxes. Most of them contained miscellaneous articles of more or less intrinsic value. One of them disclosed a dirty piece of vellum and a small brass box, beautifully chased.

In the box was something which Shaw declared might at one time have been a surgical instrument. The vellum read as follows: 'I, J. S., being about to close account and chete the hangman doe state and declare that I took the Brass Casket and Silver Scalpel from the old Shrine in the Church. This I did for a Wager. And I further testify that a painter, one O. H., did make a copy of a part of the Shrine that I took away and did hang in my dining-parlour. And I would lay a Wager that the Copy now in the Church goeth without Discoverie. And I did give to a friend of the said O. H. a Man's Tooth that I did get from a native in Van Diemen's Land; he told me that the Tooth hath magic property, the which I protest to be a Heathen conceit. And what hath been done with the said tooth I know not; but the truth is as I have said concerning the Box and the Picture. Let him who findeth them live with them, for truly I dare not.'

IF I WERE DEAD.

If I were dead I should be nearer you
Than I am now when standing by your side;
For then the barriers that now divide
Our souls were nothing. I should watch o'er you,
Fill and sustain you with the fervent tide
Of all-pervading life that courses through
The eternal me, until in time you too
Shook off this chrysalis shell of life, and died.

Then through vast realms of space no thought has
spanned,
Into the ecstasy no voice has sung,
Of Love's own kingdom of Infinity;
Wise beyond knowledge, yet for ever young
Through all the æons of eternity,
Blissful as children we'll pass hand-in-hand.

Chambers's Journal

SEVENTH SERIES

THE GILBERT ISLANDS.

By THOS. J. M'MAHON, F.R.G.S.

I.

THIS group of islands is one of the most remarkable of all the Pacific archipelagoes. The islands are small, the total area not being more than 170 square miles. The group is cut by the equator and the 175th meridian E., many of the northern islands being abreast of the Marshall Islands, now in the hands of the Japanese. The Gilberts, long under British protection, were annexed in 1915 to form part of the Crown colony of the Gilbert and Ellice Islands, being administered by a British resident commissioner and his staff, responsible to the High Commissioner for the Western Pacific, who is also governor of the Fiji Islands.

The islands are of coral formation, covered with so scanty a supply of soil that, beyond coco-nuts and Pandanus palms and a few coarse roots of the taro class, no other vegetation is natural, these being the only indigenous plant products. And yet some of these barren islands are more densely populated than the most fertile islands of Oceania. The natives number over 30,000, and were less than half a century ago a fiercely cruel and bloodthirsty race. To-day, thanks to the wise measures of British administration in the hands of capable and humane British officials, these natives are one of the most civilised, most progressive, and best educated races in the South Pacific. They are Christians, and all heathen or savage customs have long since been abolished.

II.

Tarawa is the seat of administration, or, as it is more properly called, the 'head station' of the Government. It is a perfect example of a clean, picturesque station, every inch of ground being put under cultivation of the coco-nut, the staple food and trade commodity of the islands. The administrative buildings, surrounded by well-finished coral-gravelled walks and roads, mission-houses, and the stores of some Australian traders make up a little town, fronted by a stone jetty and breakwater. Commercially this station is growing in importance every year, as it is the port of call of all ships, and the copra production of the coco-nut is fast increasing. Prior to the war the German traders had a very strong

command of all the trade, and their trading-schooners were in constant touch with all parts of the group. In these days the Japanese are most energetically competing for the native trade, which is extensive, as the natives are wealthy.

Fifty years ago the natives were known as the giants of the Pacific for their size and strength, two physical advantages which went to their undoing. In those years the pirates or 'black-birders' of Peru were out upon the Pacific waters recruiting native labour for the silver-mines of South America. These inhuman men resorted to all kinds of tricks and cruelties to entice the natives aboard their ships. Once on deck, they were quickly imprisoned in the holds and battened down until well out at sea and far away from their island homes. Few—indeed, very few—ever returned; but those that did came back wasted by sickness and disease, and the once great race of giants dwindled from thousands to hundreds, and only ten years ago, though under British administration, it was believed that the race was doomed to extinction.

To save the stock, British officials entered upon a course of administration that appeared somewhat drastic to traders and all foreign outsiders in their relationship with the natives, but it has resulted in the complete restoration to health of the natives and a continual increase in population. The sale of grog and of poor and undesirable foods to the natives was sternly forbidden; exploitation of the islands for labour was stopped; British medical men were brought out and put in charge of large, well-furnished, and well-appointed hospitals; and the natives were given a form of self-government. All these measures have brought new life, hope, and prosperity to the people, who realise the joys and the security of British ownership, and proudly boast that they are as loyal to King George as any other section of the great British Empire. This loyalty is evidenced by the liberal manner in which the natives subscribed during the war to all patriotic funds, their contributions amounting to many thousands of pounds sterling, and by the number of fine men who volunteered and went to France to defend the freedom of the world. The following little fact will illustrate the keenness of the natives to go and fight for their 'great

chief George.' A boy who held a very responsible position in the native police force made application to the British master of police to have his name put down on the list of volunteers for the front, and to be examined by the doctor as to his fitness. He was refused on the ground that in carrying out the duties assigned to him as a sergeant of police he was already serving the King. He was not satisfied; and after two days of thinking over the matter, unable any longer to control his feelings, he rushed into the presence of the master of police and exclaimed, 'Oh master, subose me no go fight for King, I very shamed; belly belong me he very sick.' This pidgin-English, interpreted, means that the boy would be broken-hearted if he were not allowed to go to the front. The boy went to the war, proved himself a brave and true Britisher, was seriously gassed, has now recovered, and is to-day the 'boss,' or sergeant-major, of the Ocean Island police.

III.

Up to ten years ago, and before active measures were taken to restore the native race, the Gilberts were subject to regular periods of drought every seven years, and such inhabitants as disease did not kill off were reduced by starvation. These droughts in many cases left islands without a single native. British administration has not only put all the coco-nut plantations of the Gilberts under experienced management, with a modern system of working designed to make them profitable and prolific in all kinds of seasons, but has taught the natives agriculture, and the cultivation of European cereals and vegetables.

Food is now plentiful, but it is noticed that as the native becomes rich he prefers the tinned foods—meats and fruits—of the Europeans, and coco-nut is in a sense going out of fashion. In fact, it is considered a sign of extreme poverty to be obliged to subsist upon the coco-nut. The authorities are wisely endeavouring to keep the people both to their natural foods and to their meagre dress—the coco-nut-fibre loin-cloth. European foods, especially canned foods, eaten in great quantities—and the natives are big eaters—have been found detrimental to health, and according to medical observation the digestive organs of the natives cannot readily endure such a change of diet without dire results.

There is no resort to force in the British management of the natives; encouragement and advice are constantly given to maintain a moral and sensible style of living, and when a native falls ill reasons are pointed out why the illness has been incurred. Splendid hospitals have been built in most of the bigger islands; the one at Tarawa, the capital, is quite a village in its size. This hospital has every modern appliance and convenience, and is in the charge of a Scotsman, an Edinburgh graduate, the chief medical man of

the islands, who spends a great deal of his time travelling round the group investigating the health of all tribes. This gentleman is ably supported by his wife, also a doctor and an Edinburgh student, who gives her time to the treatment of all diseases and ailments of the native women. Classes for the training of native men as hospital orderlies, and native girls as midwives, are subsidised by the administration, and have been very successful. These students, after examinations and proved competency, are sent out to native villages and to all corners to be useful in cases of emergency. Native police, before they can claim promotion and be put in charge of a district, must prove themselves competent to deal with all minor ailments and accidents, while in all serious cases Government schooners are at the disposal of these officers to have natives sent to the nearest big hospital. It is little wonder that the population of the Gilberts is increasing, and the death-rate astonishingly low.

The regeneration of these islanders is an example to the whole world; it is a triumph of British administration. As an example of the care taken to prevent the spread of any epidemics such as dysentery, once very common on all the islands of the South Pacific, every two years all bank-notes in circulation or saved for that period are called in, and brand-new notes distributed instead—and this without a penny of cost to the natives. Care such as this has resulted in the wiping out of epidemics, a notable fact that has not been lost on other administrations in the Pacific islands. Furthermore, how progressive are these islanders is manifest in their desire to have sewerage systems installed in all the larger villages; and a Gilbert Islands village is a model of cleanliness in all other respects.

IV.

The administration is attempting, and with every prospect of success, a fairly high standard of commercial education in the Government schools. Up to recently education was entirely in the hands of the missions, and within the mission areas or stations this arrangement is continued. The instruction is but rudimentary, and does not include the teaching of the English language, which is now—and wisely—very much encouraged by the British officials. The Government is by no means discouraging the mission schools, but by grants of money is helping on any of these schools willing to undertake a curriculum including the teaching of the English language, simple rules of hygiene, commercial arithmetic, and some industrial or agricultural training. In the native Civil Service, especially the police force, a knowledge of spoken and written English is essential, and in order that such officials may improve themselves the administration provides free night-classes, which are very popular, and are the means of making native officials proficient in the language. Court

cases, once crude and unsatisfactory owing to the need of interpreters, are now carried on entirely in English. A police-boy recognises there is no quicker way to promotion, with good service and conduct, than by a thorough knowledge of English. It is intended in the course of time to have Government schools that will offer the very keen and intelligent native youth a standard of education equal to that of the higher European schools; indeed, it is planned that students of these projected schools will pass into the highest positions of the native Civil Service, as magistrates, scribes, and so forth.

The natives of the Gilbert Islands may be said to possess a talent—wanting in many other tribes of the Pacific—of sensible self-government. Though long since civilised and Christianised, they still preserve their old spirit of obedience to a ruling caste, kings and chiefs, so sternly enforced in former days by these royal families. They have a reverence for authority. They have adopted, by the consent of the administration, a blend of British and native ideals for their legal code, so that, while observing the laws of the administration, they are allowed full rights in tribal laws and customs. For this purpose a complete native Civil Service has been formed of chiefs, magistrates, scribes, lawyers, and a police force. Regular courts are held every day in the bigger villages, not only for the trials of offenders, if any, but to inquire into domestic disputes, to consider the fitness or otherwise, and the fortunes, of young people about to marry, and to proclaim the banns if permission is given for a marriage. These courts settle all land-ownership questions, and the Gilbert Islander as a landowner loves the aid of the law in settling land matters; he is a debater and an orator of remarkable ability, and delights to keep a court sitting while he delivers, with much gesture, splendid orations on land questions. Particularly does he like to go back to the days of his forefathers, and tell how by personal prowess some ancestor in some great national upheaval became possessed of the family domains. These courts also regulate native trading and the management of the coco-nut plantations. Native municipal inspectors are ever on the look-out for the neglect of regulations pertaining to sanitation, native gardens not tilled, and roads and pathways not kept free from weeds. It is an offence punishable by fine for a native to throw old leaves, paper, or refuse of any kind on a road or near a habitation. All rates and taxes are collected by native officials; particulars of births, deaths, and marriages are noted by the police and by native clerks, called scribes, who send monthly statements to the British officials.

v.

Butaritari is one of the prettiest villages of the Gilberts. It is famous for the fact that here Robert Louis Stevenson, the great novelist,

sojourned at one period of his travels in the Pacific, when in search of health. Many of the old men and women remember him, and still talk of his kind and friendly ways. An old horse he is alleged to have ridden is still alive, but so frail that on the least exertion it topples over. It is the pet of the villagers, and every morning and night the children, as a regular duty, go out into the plantations and gather grass for its food. An old trader, living away by himself on one end of the island, was a great crony of Stevenson's, and has a great many interesting stories to tell of their adventures in that part of the Pacific. The novelist was a champion of the natives and their rights, and in one of his South Sea letters comments on the graceful dancing of the native children. The children were constantly dancing for him, and it is not surprising that he spent much time in watching them; no other native people in the whole Pacific, he declared, could compare with the natives of Butaritari. From the tips of their fingers to the very tips of their toes their bodies twist, turn, and move in perfect grace and ease. Native dancing as a rule is monotonous, but such is not the case with the Butaritari folk, who certainly are entitled to distinction for their dancing.

Until recently the Gilbert Islands were thought commercially unimportant. Australian traders for many years maintained a very popular trade with the natives, besides being the buyers of copra from the coco-nut plantations; but the war, through lack of shipping, seriously interfered with these enterprising Britons, and Japanese traders, well supplied with shipping and with Japanese manufactured goods sought by the natives, have gained a footing and opened trading-stations. This development, added to the energies of a Chinese company, has brought into being a rivalry that proves the Gilberts of great trade value, while creating a bitterness among the various traders that may eventually lead to trouble. The administration is showing no favour to any particular nationality, but the natives, though attracted by the wares of the Japanese, are not at all in favour of any trade but British trade, and it is interesting to see the manner in which they are endeavouring to check the Japanese advance by persisting in dealing in copra with the Australian and the Chinese traders only.

The Gilberts stand out as one of the finest instances of the success of British officials and British administration in promoting the welfare of a native race. Already other administrations, including the Japanese in the Marshall Islands, are copying the methods that build up an intelligent and self-reliant native people, and there is not the least doubt that in the next few years the little-known atolls of the Gilberts in the Central Pacific will come into general prominence.

THE PARTS MEN PLAY.

CHAPTER IX.—A HOUSE-PARTY AT ROSELAWN.

I.

AS is the habit of the year, June followed May, and in its turn gave way to the yellow hours of July. Lady Durwent, wearying of London and its triumphs, returned to Roselawn to share the solitary, rural reign of her husband.

As she drove in a sumptuous car through the village and into the wide confines of the estate she purred with contentment. Men doffed their caps, women curtsied, and the country-side mingled its smile with theirs. It was not unlike the return of a conqueror from a campaign abroad, and after the incognito forced by London on all but the most journalised duchesses, it was distinctly pleasant to be acknowledged by every one she passed.

In this most amiable of moods she dined with her husband, and was so vivacious that, looking at her over his glass of port, he thought how little she had changed since, years before, she had first attracted his subnormal pulse. Together they wandered over the lawns, and he showed the improvements wrought since her last visit. She gave the head-gardener the benefit of her unrestricted smile, and shed among all the retainers a bountiful largesse of good-humour.

Still noting the beauties of Roselawn, they discussed their children. She learned that Malcolm was on leave from the —th Hussars, and was golfing in, and yachting off, Scotland with scions of the Scottish nobility. The mention of Dick brought a pang to her heart, and a cloud that marred the serenity of her husband's brow. Lord Durwent regretted the necessity of his actions, but the boy had proved himself a 'waster' and a 'rotter.' He had been given every chance, and had persistently disgraced the family name. If he would go to Canada or Australia, he could have money for the passage; otherwise——

After that imperialistic pronouncement, Lord Durwent turned to more congenial topics, and spoke of additions to the stables and improvements to the church. His wife answered mechanically, and it was many minutes before the heart-hunger for the blue-eyed Dick was lulled. She said nothing for the development of her sons' lives had long since passed from her to a system, but in the seclusion of their country home the domestic tragedy made a deeper inroad on her feelings than it had done in London.

It was perhaps not unnatural that they barely spoke of Elise at all. She was visiting a county family in the north, and would be home in a couple of days. As there was no immediate

suitor on the horizon, what more was there to be said of the daughter of the house?

Next morning Lady Durwent was still amiable, but rather dull. The following day she was frankly bored. On Sunday, during the sermon, she planned a house-party; and so, in due course, invitations were issued, accepted, or regretfully declined. She possessed sufficient sense of the fitness of things to refrain from transplanting any of her *unusual* varieties from their native soil, but asked only those persons whose family connections ensured a proper tone to the affair.

Perhaps it was just a kindly thought on her part to ask Austin Selwyn. It may have been the desire of having an author to lend an exotic touch to the gathering. Or, being a woman, she may have wanted an American to see her at the head of the table in two widely different settings.

Perhaps it was all three motives.

II.

In preparation for the arrival of guests, 'a certain liveliness' pervaded the tranquil atmosphere of Roselawn. The tennis-court was rolled and marked; fishing-tackle was inspected and repaired; in view of the possibility of dancing, the piano was tuned; bridge deficiencies were made good at the local stationer's; and gardeners and gamekeepers hurried about their tasks, while flapping game-birds signalled to trembling trout that the enemy was mobilising for the yearly campaign.

Roselawn differed little from the hundreds of English country-houses, the seclusion and invulnerability of which have played so great a part in forming the English character. A lodge at the entrance to the estate supplied a medieval sense of challenge to the outside world, and the beautifully kept hedges at the side of the mile-long carriage-drive gave that feeling of retirement and emancipation from the world so much desired by tranquil minds.

It was the setting to produce a poet, or a race of Tories. Once within the embracing solitude of Roselawn, the discordant jangling of common people worrying about their long hours of work or the right to give their offspring a decent chance in the world became a distant murmur, no more unpleasant or menacing than the whang of a wasp outside the window.

Not that the inhabitants of Roselawn were any more callous or selfish than others of their class, for the record of the Durwent family was by no means devoid of kindly and knightly deeds. Tenantry lying ill were always the recipients of studied thoughtfulness from the lord and lady of the place, and servants who had served both long and faithfully could look forward to a decent

pension until death sent them to the great equality of the Beyond.

If one could trace the history of the Durwent family from the beginning, it would be seen that among the victims of a hereditary system (and can it be estimated what millions these must total?) there must be numbered many of the aristocracy themselves. Caricaturists and satirists, who smear the many with the weaknesses of the few, would have us believe that the son of a lord is no better than the son of a fool—yet, if the vaults of some of the old families were to unfold their century-hugged secrets, it would be seen that, as Gray's country churchyard might hold some mute inglorious Milton, so might these vaults hoard the ashes of many a splendid brain ruined by the genial absurdity of 'class' wherein it had been placed. A boy with a title suspended over his head like the sword of Damocles may enter life's arena armed with great aspirations and the power to bring a depth of human understanding to earth's problems, but what chance has he against the ring of antagonists who confront him? Flunkeyism, 'swank,' the timid worship of the peerage, the leprosy of social hypocrisy, all sap his strength, as barnacles clinging to the keel of a ship lessen her speed with each recurring voyage.

It is not that the hereditary system injures directly; its crime lies in what it engenders—the pestilence of snobbery, which poisons nearly all who come into contact with it, titled and untitled, frocked and unfrocked, washed and unwashed. The very servants create a comic-opera set of rules for their below-stairs life, and the man who has butlered for a lord, even if the latter be the greatest fool of his day, looks with scorn upon the valet of some lesser fellow who, perchance, is forced to make a living by his brains.

III.

The house at Roselawn was large, and, with its ivy-covered exterior, presented a spectacle of considerable beauty. The front was in the form of a 'hollow square,' creating an imposing courtyard, and giving the windows of the library and the drawing-room ample opportunity for sunshine. From these windows there was a charming vista of well-kept lawns, margined with gardens possessed of a hundred tones of exquisite colour. At the back of the house the windows looked out on receding meadows that melted into the solidarity of woods.

The drawing-room (Lady Durwent tried to designate it 'the music-room,' but the older name persisted) had all the conglomeration of contents which is at once the charm and the drawback of English country homes. Furniture of various periods indulged in mute and elegant warfare. Scattered in elegant disorder about the room were relics procured by an ancestor who had been to Japan; there was a Spanish bowl gathered by Lord

Dudley Durwent; there was an Italian tapestry, an Indian tomahawk, a Chinese sword that had beheaded real Chinamen, all procured by Lord Dingwall Durwent in the eighteenth century. There was a massive Louis Seize table and a frail Louis Quinze chair; a slice of Chipendale here, and a bit of Sheraton there; portraits of ancestors who fought at Quebec, Waterloo, Sebastopol, and a very military-looking gentleman on a terrific horse, who had done all his fighting in Pall Mall clubs. There were 'oils' purchased by Durwents who liked to patronise the arts, and 'waters' by Durwents who didn't like oils.

And year after year, generation after generation, the ancient drawing-room received its additional impedimenta without so much as a creak of protest.

In the impressive seclusion of Roselawn, therefore, the house-party began to gather. They were an admirably assorted group of people who never objected to being bored, providing it was accomplished in an atmosphere of good breeding. The soothing balm of the Roselawn meadows offered its potency of healing to fatigued minds or weary bodies, but, like the fragrance of the unseen flower, it was wasted on the desert air. Lady Durwent's guests had not been using either their brains or their bodies to a point where honest fatigue would seek healing in the perfume of clover. If a hundred gamins from White-chapel's crowded misery had been brought from London and let loose in summer's sweet-scented prodigality, the incense of fields and flowers might have brought sparkle to young eyes dull with the wretchedness of poverty, and colour to pale, unnourished cheeks. But Lord and Lady Durwent, denying themselves the luxury of such a treat, asked people who lived in the country to come and enjoy the country.

The pleasure of their guests was about as keen as would be that of a party of bricklayers invited by a fellow-labourer to spend a Saturday with him laying bricks.

IV.

To the insatiable curiosity of Austin Selwyn the party presented an infinite chance for study, as well as an unlooked-for opportunity to meet Elise Durwent under circumstances which should either cement their friendship or else demonstrate its utter impracticability.

He listened to the chat of men who did the same things all the year round with the same people, and he wondered a little at their persistency in conversing at all. They rarely disagreed on anything, partly because they were all of the same political faith, and it seemed an understood thing that, so far as it was humanly possible, no one would introduce any subject which would entail controversy. When Selwyn, who was almost too thorough a believer in the productive powers of fiction, used to drop con-

versational depth-bombs, they treated him with easy tolerance as one who was entitled to his racial peculiarities. Sometimes they would even put to sea clinging to the raft of one of his ideas, but one by one would grow numb and drop off into the waters of mental indifference. They had a nice sense of satire, and it was a delight for the American to indulge in an easy, inconsequential banter which was full of humour without being labelled funny; but it used to fill him with sorrow to see many of his best controversial subjects punctured by a lazily-conceived play of words. He felt that, coming from the New World, he was in a position to give knowledge for knowledge, but his fellow-guests were impervious to his geographical qualifications, and persisted in their pleasant task of rolling vocabulary along the straight grooved channels of their well-bred thoughts.

The women were less of a type, but their little lives were so lacking in horizon that they seemed to live in a perpetual atmosphere of personalities. As pretty much the same topics of conversation did them for a whole season, they were not unlike a travelling theatrical company producing the one show wherever they went. One woman occasioned some mirth to Selwyn by her familiarity with the obscure royalties of Europe, whom she thrust forward on every possible occasion. On dowager-duchesses and retired empresses she was without parallel, and she went through life expressing perpetual regret that she had not known you were going to Ruritania, because she would have insisted upon your calling on her friend the Empress Lizajania.

It was perhaps an unfortunate circumstance that had brought together a group of women none of whom was artistically accomplished, although they were by no means lacking in social charm. Music for them was not a refreshing stream which ran by the road of everyday life, but something which was to be heard at the Opera, and which enjoyed a close alliance with sables and diamond tiaras. Pictures were of the Academy, and, like all the best people, they invariably said, 'Have you seen this year's show at Burlington House? My dear, it's frightful.' Nor did they neglect literature in their curriculum. Though literature lacks a yearly exhibition, such as is possessed by music and painting, they made it a subject for gossip, and denounced H. G. Wells as a 'bounder.' 'I never read him, Mr Selwyn,' said the obscure-royalist person. 'My cousin the Duchess of Atwater met him, and says—well, really, she says he's quite impossible.'

With a mixture of wonder and amusement Selwyn watched the spectacle of these people of more than average education and intelligence contenting themselves with a perpetual routine of small-talk and genteel insularity, and he wondered how it was that a race so gifted with the blessed quality of humour could evolve a

state of society offering such a butt to the shafts of ridicule.

He liked Lord Durwent, whose unflinching gentleness and courtesy would have stamped him as a gentleman in any walk of life. Although his mind was comparatively unimpressible to new ideas, it was saturated with the qualities of integrity and fairness, and in his attitude towards every one there was an old-world dignity, born of the respect in which he held both himself and his guests. The study of this man moving contentedly about his daily tasks, never making any one's day harder by reason of his passing that way, was the first jolt Selwyn had received in his gathering arraignment against English social life. By way of contrast he pictured certain successful gentlemen of his acquaintance in America, and the vision was not flattering to his national self-esteem.

He also enjoyed the refreshing vitality of Lady Durwent, who never quite lost her optimism no matter how tight was the grip of good form, and he admired without stint the devotion of every one, regardless of sex, to sport. Throughout the day there were constant expeditions that necessitated long, invigorating hours in the open air; and it seemed to the American that they were never so free from affectation, that the comradeship between the men and the women was never so marked, as when they were indulging their wise instinct for out-of-door sports.

He had been at Roselawn a couple of days before he had a chance to do more than observe Elise Durwent as one of the party. She had been his partner at tennis and bridge, and a dozen times he had exchanged light talk with her, but there was always about her the defensive shield of impersonal cordiality. When he spoke to her it was almost in a drawl, but no matter to what a lackadaisical level he reduced his voice, her replies were always punctuated by a retort that had in it the sense of sting, as Alfio in *Cavalleria Rusticana* accompanies his song with the crack of a driving-whip.

He watched her with the men of the party, and wondered at their good-natured endurance of her sharpness, as reckless as it was disturbing; and he saw that her inclusion among the women made them less at ease and disinclined to chatter. No matter what group she joined, she was never of it; and even when it was obvious that she was doing everything in her power to reduce her personality to the pitch of the others, her individuality branded her as something apart.

Studying her, partly subconsciously and partly with the keen observation prompted by the attraction she held for him, Selwyn began to feel the loneliness of the girl. Not once did he see the melting of eyes which comes when one person finds close affinity in the understanding of a friend. When she spoke at the table her suddenness always left a silence in

its wake. At bridge her moves were so spasmodic that, when opposite dummy, she seemed to play the two cards with a simultaneous movement. The same mannerisms were in her outdoor games, a second service at tennis often following a faulty first so rapidly that her opponent would sometimes be almost unaware that more than one ball had been played.

Selwyn's original feeling of exasperation mel-

lowed to one of genuine pity in contemplation of her solitary life—a life directed by a restless energy that only grew in intensity with the deepening realisation of her purposelessness. Yet she was so confident in her bearing, and so capable of foiling with repartee any approach of his, that he contented himself with a studied politeness that was no more personal than the grief of an undertaker at a funeral.

LEAVES FROM A CATALOGUER'S WALLET.

II.—THE MYSTERY OF TWO HOPPNER PORTRAITS.

By W. ROBERTS.

I.

UNDER the will of Miss Julia Crokat, late of 9 Chester Place, Hyde Park, London (who died on November 4, 1914), two charming little whole-length portraits by John Hoppner, R.A., were bequeathed to, and accepted by, the National Gallery. One, the elder child, Frederick Van Diest, is standing in a landscape, and is dressed in old gold breeches, which come nearly up to his arm-pits and partly hide his dark coat; in his left hand he is holding his large felt hat, and in his right a toy riding-whip. The sweet, bonny-looking little girl, Louisa Anne Van Diest, is also standing in a landscape, by a shallow brook. She is dressed in white, and is holding flowers in both hands, a fold in her pinafore being thrown over her left arm.

There was no record of Hoppner (or indeed of any one else) having painted these portraits; but that is not remarkable, seeing that every portrait-painter of the day painted many portraits which passed directly from the studio to their homes without any kind of publicity, and remained entirely unknown for generations, except to members of the family. As Reynolds and Romney kept full records of their sitters, we know pretty well who sat to them; but Hoppner, with many others, kept no such record—or, if he did, it has not been preserved. And so in the matter of attribution we have to be guided partly by tradition, and partly by the portraits themselves. Tradition is not always to be relied upon, and even appearances are not always convincing; for, executed at the same time and influenced by Sir Joshua Reynolds, the work of Hoppner, Beechey, and Owen, to mention only three justly esteemed artists, is very much of a type, especially in the case of children, with whom the fashions in dress are less likely to help as to period than in the case of adult men and women. But there is no reason for questioning the Hoppner attribution concerning the two portraits of Master and Miss Van Diest, which were generally acclaimed as welcome and attractive additions to the

national collection. Coming into the possession of the National Gallery early in the war, they were for some time hung in Trafalgar Square, and have now been removed to the Tate Gallery.

The point regarding the two portraits, however, was a matter not so much of artist as of identity. Who were the Van Diests? The name is clearly Dutch. A century ago (as to-day) a large number of merchants and others with the Dutch prefix of Van could be found in London Directories, and even in Boyle's *Court Guide*, but Van Diest has not been found amongst them. These two children are obviously, one might almost say aggressively, British, and the portraits evidently date from the early years of the nineteenth century. Rightly or wrongly, it has always seemed to the writer that a portrait without any biographical details loses two-thirds of its interest, sometimes indeed the whole of it, if the portrait is an indifferent one. The lives of all prominent men and women have been written more or less fully, somewhere and at sometime, and in such cases details are not difficult to find. It is with people of by-gone times who were neither eminent nor notorious, but only good citizens, that a difficulty is often experienced in obtaining definite biographical details. Generally speaking, the people who sat for their portraits to Reynolds and his contemporaries and followers were of some mark in the world. When not titled folk or wealthy commoners of whom details are readily accessible, they were prosperous business or professional people whose deaths would almost surely be found recorded in the *Gentleman's Magazine*.

II.

When it was desired to obtain some biographical particulars respecting the little Van Diests, there seemed to have been almost a 'conspiracy of silence.'

It was known—or perhaps it would be better to say understood—that the little boy and girl were the children of no less a person than H.R.H. Frederick, Duke of York (1763–1827),

but that was not much of a clue, for the Peerages do not as a rule recognise the children of the sinister side. The *Sunday Times* of June 14, 1917, under the heading 'Ninety Years Ago' (1827), reprinted the following paragraph: 'It is not generally known that the Duke of York left two natural sons, who are now grown up.' Perhaps for 'two sons' we should read 'two children.'

The Duke of York was the second son of George III. He was elected Bishop of Osnaburg, in Germany, when a year old, and in due course became Commander-in-Chief of the British Army. Like his elder brother the Prince of Wales, the duke led a somewhat hectic life as a young man, and, also like him, seems to have regarded himself as above and beyond the moral obligations and restraint which good citizenship connotes. The royal brothers were patrons of all forms of amusements and dissipation, and the famous Vauxhall Gardens were frequently 'honoured' with their august presence. It may only be a coincidence, but, as we shall see presently, the Van Diests lived at Stockwell, less than a mile from Vauxhall Gardens, and there also, and at the same time, resided Bryant Barrett, the chief proprietor of the celebrated Gardens. In Germany, where he acquired his military knowledge, the Duke of York appears to have become famous for his pleasure-loving propensities. Mirabeau, who was in Berlin in 1786, described him as a '*puissant chasseur, puissant buveur, rieur infatigable, sans grâce, sans contenance, sans politesse,*' who '*ressent une espèce de passion pour une femme mariée à un mari jaloux, qui le tourmente et le détourne d'un établissement.*'

We need not concern ourselves too fully with the duke's love affairs. The most notorious of these was the entanglement with Mary Ann Clarke, which began in 1803, and which brought about his resignation as Commander-in-Chief. There was a much earlier one, of which an account appeared in that *chronique scandaleuse* of the time, the *Town and Country Magazine*. In the issue for February 1788 there is the story of 'The Memoirs of the Military Bishop and the Convenient Wife.' It is illustrated with 'a striking likeness' of the former, and a 'beautiful profile' of the latter. There can be no possible doubt as to the identity of the 'military bishop,' whose intrigue with the 'convenient wife' was revealed to her husband by a servant, who, for his pains, was, as we are assured, thrashed with a cane 'from the drawing-room down to the parlour,' where he was stripped of his livery and dismissed. The husband, nevertheless, went to his wife's apartment, and breaking open an India-wood cabinet, found letters which left no doubt on the subject of the truth of the servant's information. The wife, on her return home, was confronted with the evidence, 'and the result was that the interests of the husband should be

promoted through the medium of the wife. . . . Our hero was written to—an English jury was mentioned . . . and a promise of service was given.' Of the nature of this 'service' there is apparently no trace. And whether there was any connection between this little affair recorded in 1788 and the Van Diest children it is impossible to say. There may have been none at all, and it is certain that the two children were not born until some years afterwards.

III.

Two generations of the Van Diests lived at Stockwell Common, which was until well into the first quarter of last century a hamlet of a few houses, and which many years before had come suddenly into the limelight of publicity with 'the Stockwell ghost,' of which the story has been told many times. It was here, on April 17, 1814, that George Van Diest died; it was here also, on January 10, 1831, that Mrs Anne Van Diest, 'otherwise Hart,' passed away at the age of sixty-eight; and yet here again that the death occurred, on July 9, 1848, of Frederick George Van Diest, Esqr., who (doubtless after having gone through various grades of public service) had been gazetted a Gentleman of the Privy Council on January 7, 1833, and who had, when a child, sat, or rather stood, to John Hoppner for the portrait now in the national collection.

We can help to piece together, in part at least, the fragments of the story of the two children from the various wills at Somerset House, where so many romances lie buried. George Van Diest describes himself as of Middlesex and Surrey, and so he may have been engaged in commercial enterprises in London. He was a man of considerable wealth, and must have kept up a good establishment at Stockwell, for in his will he speaks of his carriages and horses. We have the first revelation of a little romance in George Van Diest's reference to 'my beloved friend Mrs Ann Hart, with whom I have lived on terms of affection for near thirty years, she living as and commonly called Mrs Van Diest,' but, 'for particular reasons known only to ourselves, never united in wedlock.' We have another revelation in his generous bequests to Frederick George Van Diest, 'who has been brought up and adopted by me as my son,' and Louisa Ann Van Diest, 'likewise in the same manner adopted as my daughter.' Certain moneys were to be handed over to them on attaining the age of twenty-one, which in the case of the boy would be on June 19, 1821, and of the girl August 17, 1823. Thus we have the dates of the respective births as June 19, 1800, and August 17, 1802. There were various other specified bequests, notably one of a shilling to his 'very worthless' brother John.

It might be assumed from this that the chief *bénéficiaire* under the will, 'my beloved friend Mrs Ann Hart,' was the mother of the chil-

dren. But this is not so, and it may be assumed that the real Mrs Van Diest, if there was one, had left her husband many years before. It is interesting further to note that the intimate friendship which had existed between George Van Diest and Mrs Ann Hart for 'near thirty years' takes us back curiously close to the time of the episode related by the *Town and Country Magazine* of February 1788. This, like the proximity of Stockwell to the favourite resort of the royal princes, Vauxhall Gardens, may be a mere coincidence. The 'Mrs Van Diest, otherwise Hart,' left in possession also made a will, and this she signed with a X, which suggests that she may not have been an educated woman. Her language, or that of her lawyer for her, is exceedingly explicit. She bequeathed her property to 'Frederick George Van Diest and his sister Louisa Ann Crokot'—the latter evidently having married in the interval between 1814 and 1831, probably the Charles Crokot who is recorded in Boyle's *Court Guide* of 1831 as then living at 14 Connaught Square, London. It is obvious that, had she been the mother of the two children, she would have specifically named them as such; but nothing whatever is said of their parentage on either side. In his will, Frederick George Van Diest describes himself as of the Treasury Chambers and Stockwell, and his eventual heir was Charles Frederick Crokot, 'son of my sister Louisa Ann Crokot.' It thus makes no great demand on the intelligence to see how the two Hoppner portraits came into the possession of the late Miss Julia Crokot, who left a comfortable little fortune of over £36,000, and made a number of charitable bequests to public institutions, but whose memory will be best perpetuated by her gift of the two Hoppner portraits to the nation. It is this public bequest which justifies the piecing together of the fragments of a little royal romance which has not

hitherto been told. Objection may be urged against the retelling of old and often unsavoury stories of the private lives of those who have passed beyond defence, and many of whom were exposed to temptations entirely unexperienced by ordinary folk. But time has softened down many of the asperities of the social life of a century or more ago; and in the case of these two charming portraits, the story had to be told as far as it could be, or told not at all. Even now there are missing links in the chain of evidence; but we know exactly the dates of birth of the children, and their father's name and station. We can only suppose that their mother was the legal wife of George Van Diest. Perhaps her story may be a tragedy of which the text is the old familiar one of 'Put not your trust in princes.'

That Hoppner should have been asked to paint the two portraits is not surprising. He was the official portrait-painter to the Prince of Wales, and most of the Carlton House set sat to him at one time or another. He exhibited two whole lengths of the Duke of York at the Royal Academy, one in 1791 and another in 1792; in the latter year also one of the Duchess of York with her ladies-in-waiting—all of which are well known through the engravings by Hodges and Dickinson. Curiously enough, Hoppner himself was reputed to be a natural son of George III.—a rumour which Hoppner himself never troubled to deny, and which is a treasured legend in the family even down to our own time. Hoppner's putative father does not anywhere come into the story of his life, but there seems to be no reason to suppose that the painter was the son of George III., with whom, as a boy, he was a favourite. About Hoppner's early life, as about those of his two sitters, Master and Miss Van Diest, there are mysteries which even time, and wills, and church registers will probably not solve.

HENRIETTE DE BEAUVALLON.

PART II.

I.

BUT all this has been a digression from Monsieur le Général, the French prisoner-of-war on parole at Dulbury, whose advent caused such a flutter of excitement in the peaceful little village.

Monsieur le Général was invited here, there, and everywhere, until his captivity seemed like to turn his head. All were charmed with his foreign grace and liveliness, and though so lately a deadly enemy, he was voted a decided acquisition to society in Dulbury.

But Monsieur le Général belonged to the New Régime. Though he had learnt all that appertained to the art of war, his education in social

matters had been overlooked in his youth, and he had never had time to remedy this omission in his strenuous years of campaigning under Napoleon. In short, he had never learned to perform the elegant dances of genteel society. What was more natural, then, than that he should present himself as a pupil to his exiled countrywoman?

But Mademoiselle Henriette de Beauvallon (whose ardent democracy had faded somewhat with the wear and tear of life as an *émigrée*) belonged to the Old Régime. She could not bring herself to countenance a so-called general of the upstart Corsican. She had never even allowed her eyes to rest upon him. If she espied him in the distance as he swaggered

about Dulbury, she quickly made tracks to avoid coming to closer quarters. She had not lost the pride of the De Beauvillons, though she had lost all else. So, when Sally, Widow Watkin's niece and helper, burst into her parlour, round-eyed and rose-cheeked, with a 'If you please, mamselle, 'ere be the French general sendin' compliments, an' would you be so good as give 'im lessons in dancin'?' it is not surprising that Henriette de Beauvallon drew herself up stiffly, and looking round upon Sally with an air of great haughtiness, replied majestically, 'Tell monsieur that Mademoiselle de Beauvallon cannot be instructress to one of Bonaparte's supporters.'

Whether the refusal reached Monsieur le Général's ears in exactly the same words may be doubted, but the gallant officer did gather enough from Sally's rendering of 'the message to understand that he need not hope to repair his neglected education under 'Mamselle Vallong.'

II.

There was a short, sharp snowstorm after the spring had seemed fairly set in, and all Dulbury lay under a thick white mantle. It was evening and full moon, and Henriette was returning to Widow Watkin's after giving her usual lesson in deportment and the French language to the young ladies at Fairfield Manor. She was crossing the common which lay between the manor and the village by a narrow pathway that had been trodden down in the snow by wayfarers. The brilliant moonlight, reflected by the glistening snow, rivalled the light of day, and by its brightness Henriette descried the not-to-be-mistaken figure of Monsieur le Général on the pathway several paces before her. For a few moments she was under the impression that his face was turned towards the village; but presently she perceived that it was not so—that he was coming towards her, that unless she turned and walked back she must face him. For an instant she thought she would turn, rather than have to pass him in such close proximity as the narrow pathway would make necessary. But almost as quickly the old pride of her race rose strong within her. Was she, a De Beauvallon, to give way before one of the new order? So she boldly kept on her way, her head high, her heart high too, tripping daintily on the trodden snow in her little black satin boots, her skirts held up as only a Frenchwoman can hold them, so that the general recognised her for his countrywoman while he was yet too far off to discern a single feature of her face.

No thought of flight occurred to his mind—not because it would have been unbecoming in a man and a soldier to entertain such a craven idea, but because he was at once consumed with a lively curiosity, and felt that the opportunity so long denied him of seeing this aristocratic but elusive *émigrée* was come at last.

They approached. The path was too narrow

for two to pass abreast. Monsieur le Général courteously made way, stepping aside into the deep snow, and saluting as he did so. The moonlight gleamed brightly upon the buttons and badges of his military cloak and fell bewitchingly upon his well-cut features, but Mademoiselle de Beauvallon's dark eyes looked steadily into space. She bore herself with all the defiant pride and grace that the women of her order had shown in mounting the guillotine.

But the moonlight that fell upon the handsome face of the young soldier fell also upon hers, accentuating the ugly, dark-red scar upon the clear pallor of her cheek, rendered yet more pallid by the filmy light.

His eye fell instantly upon the cicatrice. The sight of it caused his heart to give a strange throb, and wrung from his lips a cry of surprise: 'Mademoiselle Henriette!'

At the sound of his voice she drew up sharply. Who could have called her by that familiar name? One, surely, who belonged to those past scenes in her life. She turned and retraced a step. 'Have I the pleasure of monsieur's acquaintance?' she asked formally in their common tongue.

'Do you not know me, mademoiselle?' he said with eagerness, standing stiffly to attention. 'Have you forgotten Marcel Raimond?'

'Marcel Raimond!' she exclaimed in astonishment. 'Marcel Raimond! Is it possible?'

She held out her little gloved hand with aristocratic graciousness, and he stooped and kissed it, not peasant-like, but elegantly, as befitted an officer and a gentleman.

'I little thought that Monsieur le Général of whom they speak in Dulbury was an old acquaintance, else'—She stopped. Politeness forbade confession that her shunning of the Corsican's officer had been deliberate.

'Nor I that'—He too broke off abruptly. '... That the dancing-mistress of Dulbury was Mademoiselle Henriette de Beauvallon,' were the words that were on his tongue, but he could not utter them.

'I am glad to have seen you again,' she pursued, rallying herself with effort from the shock of the encounter. 'I should never have known you,' she went on, looking him up and down as he stood before her in the snow in his smart cavalry uniform and graceful swinging cloak, trying to reconcile this fine figure of a man with the rough peasant youth she used to know long ago at Beauvallon.

'This is unfamiliar to you,' he replied, placing his hand upon the breast of his military tunic, resplendent with ribbons and lace.

'It is of the New Régime,' she remarked, and was at once conscious of a note in her voice, involuntary, but coldly disdainful; then, forcing herself to graciousness, she added, 'but it becomes you well!'

'Thank you, mademoiselle,' he responded,

bringing his hand up smartly in a salute. 'You are generous!' His eyes dwelt appraisingly upon her shabby little figure. 'But you were ever generous, Mademoiselle Henriette. I have not forgotten.'

She smiled, and a faint flush of pleasure rose on her pale cheek, though he could not see it. This little allusion to their former acquaintance touched her deeply—so deeply that she felt overcome by it. There was much she would have liked to say to him, but could not. Emotion choked her utterance, so that she could only hold out her hand, murmuring, 'I must bid you good-evening, monsieur!' then added, half with patronage, half with desire, 'We shall no doubt meet again.'

'Mademoiselle is kind! It will indeed be a pleasure,' he assured her with warmth, taking the proffered hand and hoping she might yet linger a while.

But she withdrew it at once, and, without another word, dropped him a stiff little curtsy and went on her way.

As for Monsieur le Général, he stood like a sentinel in the snow watching the little figure wending its solitary way across the common until he could see it no more.

III.

That meeting in the snow marked another scene in the life of Henriette de Beauvallon which was to remain as vivid as all the earlier scenes. It was the first in a new Act. The snow cleared away. The moonlight gave place to sunshine and the sweet loveliness of an English April. To Henriette the springing green of those English trees and hedgerows was ever to be associated with the green uniform of Bonaparte's officer. Did she walk abroad between the green-tipped hawthorn-hedges, by strange chance Monsieur le Général beguiled his captivity by strolling in that very lane, and counted himself happy when he received the distant and stately bow of Mademoiselle de Beauvallon. Never did she cross the common to give her lessons at Fairfield Manor but Monsieur le Général would be posted at some point to salute her as she passed, or, when mademoiselle deigned to permit, to escort her to the gates.

These occasions made red-letter days for Marcel Raimond, and gradually they became more frequent as the pride of the De Beauvallon slowly melted beneath the warmth and constancy of his devotion.

It was a devotion as reverent as that he had been wont to accord to the daughter of the marquis, but had none of that abject servility which had so distressed her democratic soul at Beauvallon. Rather did it draw her back to the serene and pleasant intimacy of childhood when they had been happy brother and sister together, sharing each other's joys and griefs as if there was no gulf between.

Little wonder, therefore, that a feeling of utter forlornness came over the heart of Henriette de Beauvallon when the news reached Dulbury that there was shortly to be an exchange of prisoners, and that Monsieur le Général would be repatriated. She felt as if she were again to be uprooted and torn away from the comfortable security that had been wrapping her about these summer days, with Marcel Raimond ever ready to carry her satchel of lesson-books, or offer his help at the wayside stiles; to open and close the gates of fields and paddocks, and ward off the unwelcome attentions of the cattle while he escorted the mistress of French deportment to the homes of her pupils in the manors and the farmhouses round Dulbury. Ah, how comfortable and pleasant had been his protective presence!

But with the proud courage of her birth and blood she braced herself to rejoice with the prisoner-of-war on his good fortune when, meeting her on the common in the late afternoon on her return from Fairfield Manor, he confirmed the dread rumour.

'How glad you will be to see France again!' she said with sweet sympathy.

'Yes,' he replied. 'And yet my captivity has been far from bitter. I have learned to like England.'

'It is a kindly land,' she murmured, looking away across the green-sward, which appeared all dark to her tear-stung eyes, although the sun shone golden.

He agreed cordially. 'I did not know the English before. I regarded them only as our hereditary enemies,' he went on. 'Now I understand them better, and can appreciate and admire their many good qualities. There are, in fact, some English customs I wish with all my heart we had in France.'

He spoke with such a sudden fire of energy, and slashed so fiercely with his cane at a clump of marguerites growing by the pathway, that Henriette turned to him in mild surprise.

'Which custom in particular, Marcel?' she asked.

He gave a little, short, embarrassed laugh, and took out his handkerchief to wipe his brow. They had reached the ancient beech-tree that stood in the centre of the common. Round its giant trunk ran a rustic bench, comfortless, but cool and shady.

'The sun is warm to-day. Will mademoiselle not rest a while?' he suggested.

Never before would Mademoiselle de Beauvallon have condescended to occupy this common seat, but remembering that the days would be numbered now in which she might walk and talk with her friend and countryman, her pride consented to solace her pain.

'But you have not told me, Marcel, which English custom you desire to introduce into our France,' she reminded him when she had settled

herself with aristocratic grace upon the rude bench, and Monsieur le Général stood by her side fingering his cane.

He laughed again with an embarrassed air, and shifted his position uneasily. 'It is their manner of betrothal, mademoiselle,' he confessed. 'Here in England a man may ask the lady he loves to be his wife without any formality. In France'—He shrugged his shoulders expressively. 'You know how it is!'

She assented, thinking all of a sudden of her own betrothal in those far-off days, and gave a little shiver as she recalled the image of the Marquis de Lafère.

'Mademoiselle,' began Monsieur le Général, after a few moments' silence, looking downwards and scratching the toe of his shining Hessian boot with his cane, 'do you think that, being in England, I might venture to use an Englishman's privilege?'

He raised his head and looked straight at her with an eager light in his eyes, and a deep flush rose on his bronzed face.

'Have you lost your heart to an Englishwoman?' she asked, with an assumption of lightness she could not feel.

'No,' he answered gravely, with his eyes lowered again and his two hands clenched firmly upon his cane. 'I lost my heart years ago, Mademoiselle Henriette, to—to you.'

'Marcel Raimond!' she exclaimed, and her eyes fixed his with a strange look in them that filled his heart with fear.

'Mademoiselle—Mademoiselle Henriette!' he cried imploringly, holding out his hand. 'Forgive me! I have dared too greatly.'

'I had no thought of this, Marcel,' she murmured gently; 'no thought. And yet—ah, my friend—my dear friend—I think—nay, I know—that you have all my heart!' And she put out her hand and drew him down on the bench beside her.

IV.

Thus the curtain drops upon a love idyll. There is one more scene, however, in the strange whirligig of life through which Henriette de Beauvallon passed.

The negotiations for the exchange of prisoners were completed, and Monsieur le Général was to depart from Dulbury on the morrow, *en route* for France.

When he met her at their trysting-place on the common, Henriette observed at once that he was possessed by an unusual excitement.

'I have something to tell you, mademoiselle,' he began, with an embarrassed air, as though he would make a confession.

'Am I not Henriette to you, Marcel?' she objected.

'Ah, yes, forgive me! Henriette, the emperor has honoured me!'

'Then I am honoured too,' she responded, smiling brightly and taking his hand in hers.

'But, mademoiselle—Henriette—he desires to create me Comte'—he stammered confusedly, the blood rushing to his face—'Comte de Beauvallon!' And his voice broke upon the words.

'Comte de Beauvallon!' she repeated slowly, her eyes widening, and her clasp tightening upon his hand. 'Comte de Beauvallon!'

'I shall not accept the title if it pains you, mademoiselle,' he declared hotly. 'I shall refuse it, though the emperor frown.'

'But why should it hurt me, Marcel?'

'You are of the old *noblesse*,' he reminded her gently. 'Can it please you that I, a son of the people, should bear the great old name?'

'Yes, Marcel,' she made answer, looking at him with loving pride in her soft dark eyes. 'It pleases me much, because you bear by right a better title—one that no emperor can bestow or mob-rule take from you. You are what the English call "a gentleman."'

THE END.

THE PIRATES OF THE POOL.

By H. MORTIMER BATTEN.

I.

IT was 10 P.M. by Summer Time. Supremely peaceful the little valley lay, a land of shadows, filled with the sleepy rush of water. A pool of blood among the clouds marked the place of the sun's death, and the burn, which at this point issued from the cañon's depths, shone like a path of burnished gold amidst the sweet, damp shadows. Here it passed under the rustic footbridge, swerved to the left, and, half-encircling the level lawns, tumbled over the dam in a cascade of purest, sweetest crystal. Just below there, so festooned and draped with

nature's camouflage that it seemed a part of its rocky setting, stood an ancient mill; while high on the northern hill, high above the wild and unkempt terraces of rhododendron and syringa, towering aloft through a fairy haze of pines, stood the stately castle.

It was an infinitely lovely place, infinitely peaceful, and all these things—the burn, the mill, the woods, the lawns, the very hills, indeed—all these priceless incomparable riches belonged to the old man at the castle, whose estate was known to be the poorest property in all the range!

There was no breeze to-night, and even had there been it could scarcely have reached that

sleeping dam, nestling so deeply in the wooded bowl of the mountains. Then suddenly the mirror-like surface broke at its very centre—broke into a thousand racing ripples. Something was cleaving the surface, something that twisted and turned and doubled back on itself; yet no living thing was visible—merely the arrow-head of light, a crimson wedge, pursued by an army of glancing, bloody swords. The fire-play ceased, the crimson slashes died, and slowly the dam resumed its sphinx-like external calm.

Under the northern bank, under the sweet syringa-bushes, where an old and slippery log lay half-submerged, there was a suggestion of movement. One felt, rather than saw, that a shadowy form left the water at this point, deep among the shadows, though it made never a ripple in doing so. Then there sounded a startling scream, short, piercing, and so high-pitched that it could best be described as a whistle. For the merest fraction of time it filled the whole little valley with echoes, then left one wondering whether it had ever occurred, wondering if one's sense of hearing had played a trick!

Five seconds elapsed; then from somewhere up the burn there came an answering call—not the same sound, nothing like it, yet unmistakably an answer. It came from the stagnant depths of the cañon-mouth—a shrill, sharp 'Kerr-r-k,' not unlike the 'false alarm' note of a moorhen, yet seeming of immense volume in this valley of stillness.

Five seconds, ten seconds, passed. The hiss of water seemed to enhance, rather than break, the quietude. Then again a crimson arrow began to speed across the dam, widening, flashing, pursued by a thousand glancing swords. Straight to the submerged log it went, and there followed a bedlam of strange unearthly sounds. It was as though, in the twinkling of an eye, the silent place had become peopled by an army of hobgoblins, pixies, strange folk of the shadowy nooks, call them what you choose.

What did it mean? There was something sinister about the whole affair—the breaking of the mirror-surface by some unseen and darting form, the breaking of the sleeping air by a sudden mad chorus of grunts, chirps, snorts, hisses, screams, and whistles. What did it mean? It meant just this—that a male and a female otter had united after a spell of twenty-four hours apart. It meant that the first had swum, just under the surface, to the submerged log, mounted it, and called his mate. She had answered from the cañon-mouth; she had come instantly in response to his call, ready to roll and gambol with him, for, no matter how pressing other matters may be, an otter has always time for frolic.

There, on the submerged log, amidst the scent of the syringa, the two sat, or, rather, rolled and embraced each other, rubbed their faces together, twined their long, soft bodies in and out till none

could have told which head belonged to which tail, and then slid silently into the water, disentangled, and began to indulge in the strangest aquatic contortions one could imagine.

Surely these were not warm-blooded, fur-clad things? No; they were serpents—serpents that rolled and dipped and twisted and writhed, creating scarcely a ripple in the process. Both would come to the top; they would clench, grapple, and vanish, one back downwards, writhing and twisting as they went, to separate below, then rise again.

II.

Suddenly the pin-wheel broke apart, and the crimson arrow-play began again. One otter shot off to the right, the other to the left, and between the two there suddenly arose, from the very centre of the dam, a great, silver, flashing body. It broke the surface with a roar, shot upwards for a sheer two feet in a slashing, lashing leap, then fell back into the flood with a sound to be heard from the hill-tops on either side.

This was a salmon, fresh from the sea—the first of the season, for it was yet early May—leaping to rid himself of the sea-lice; twenty-two pounds of darting, flashing fishhood, the fittest of all the dwellers of the deep.

The otters had seen him as he rose for his leap; hence the sudden abandonment of their game and the quick assumption of battle array. The salmon had not yet seen them, but sinking back into the pool, he was not long in doing so. He had passed a thousand perils on his inland voyage, perils that scooped up his fellows to left and to right, till he voyaged on alone, the sole survivor of a whole battalion; but those perils—the drift-net, the tail-net, the weir, the lure—he simply did not recognise as things of death. *This* death he understood. He saw a shadowy form moving swiftly towards him, a form that swam like nothing else save a leech, for it twisted and rolled in the water, seeming to use its entire length, from the tip of its nose to the tip of its tail, as a means of propulsion. The salmon swerved. His dorsal fin stood on end; he became at once a fierce and terrible monster of the deep; but unwaveringly his dark opponent came on.

In the ace of time the big fish turned, flashed like an arrow in the opposite direction, but only to find himself confronted by the second otter. Downwards he plunged, down and over, then up, to dash across the surface at tremendous speed, then down again, heading up-stream, as a hunted salmon always does.

The otters simply followed. They were not so swift as he, but there was this difference—that whereas the big fish flashed to and fro in lightning rushes, the otters kept up one steady speed, never pausing, never diverging, and heading always straight at the mark. It is in this way that the weasel outruns the hare and the mink outswims the beaver, and even had there

been but one otter, that salmon's fate was assuredly sealed.

Systematically they quartered to left and right, far below the surface now, yet working together like two well-trained greyhounds. The salmon had made his choice; he had headed up-stream, and thither he should go—on and up into the shallow water. There was no turning back, and precious little chance of outmanœuvring, for now the dam was narrowing, becoming shallow.

The big fish saw the peril. He made for the top again, and with a roar of water doubled back between the two otters, leaving a train of phosphorescent foam.

Exactly how things happened one cannot say, but suddenly the rush ceased, and there rose to the surface at that place a gleaming silver body, perfectly still. Once only, for the space of a second, it lashed the water into foam, but the foam was stained with brown, for from the neck of the salmon, his most vital part, a piece was missing—a piece the size of a breakfast biscuit, bitten clean out, as though it had been chipped by a giant round-edge chisel. The otters dragged him out on to the moss-covered rocks, and there they left him while they rejoiced—rejoiced over a worthy prey, the fittest of the fit, outmanœuvred on his own ground, and beaten at his own game. They rolled and plunged and pin-wheeled across the dam and back again. The old man at the castle heard them, and wondered; the old man at the mill heard them, and *knew*.

Soon the otters went back to the salmon and ate a little of it. They did not eat much, because they were not hungry; and presently they dragged the fish back into the water, rolled over it, swam around it, and left it to drift with the blossoms whither the current willed.

Some hours later the two otters separated, the male to wander off as his restless spirit dictated, the female to manage her own affairs, in which he played no part. Sometimes a night, two nights, would pass without her seeing him; but always he turned up in the end—never was he very far away. Up-stream to the moorland-edge he would go, and there, by a certain rock, where the roe-deer stooped to drink, he would set out through the heather, away over the watershed to the burn that flowed down the adjoining valley. Always he followed the same trail; always, indeed, he trod in his own footsteps; and so, passing down the neighbouring stream, he would gain a point at which it forked, and a twisted pine-tree stood. This was his recognised boundary. Here the reserves of another otter began, and respecting his neighbour's rights, he would leave the water by the pine, and cross through the woodlands and over the moors by the beaten trail that ended in the home stream.

And the female? At the mouth of the cañon, just above the rustic bridge that spanned the burn between the castle woods and the lawns, she had her den. It was high up in the

bank, well above the highest water-line, but the one and only entrance and exit was a foot below the lowest summer surface—a narrow hole in the sandy bank, amply screened by fibrous roots. The hole ran steeply upwards from its mouth, and ended in a spacious chamber, lined with moss and grass; and here, in the silence and darkness, where even air was none too plentiful, she nursed her tiny kits.

III.

Next morning the old man at the mill was astir very early, and dothed his way across to the grid through which the racing waters passed to the mill-wheel. His old eyes sparkled when he saw what awaited him there—twenty pounds of fresh-run salmon carried by the tide, and practically untouched by his friends the otters! Of course, the salmon really belonged to the castle, but the old man at the mill had his own ideas about fish that come from the sea, and, anyway, he chose to regard the contents of the drift as rightful pickings.

A few hours later the old man from the castle came sauntering down. He met his keeper on the bridge. 'M'Queerie,' said the laird, 'I think I heard otters in the dam last night.'

'And that you did, sir,' replied the keeper, restoring his pipe to its accustomed place between his jagged molars. 'I'm thinking it won't be long, sir, before I shift them brutes.'

The old man looked up keenly. He rather liked the wild things in his half-hearted way, but generally he bowed to the keeper's superior knowledge in such matters.

'Why?' There was a tone of defence in the old laird's voice as he snapped out the question.

The keeper removed his pipe again and spat into the pool. 'Because there won't be a fish [salmon] in the dub, sir, so long as them things is about,' he answered. 'I wouldn't trust them with pheasant chicks neither—an otter's nothing but a big weasel, you know, sir.'

Just then the old man from the mill came sauntering up. 'Well, M'Nab,' said the laird, 'you've lived by the water longer than any of us. What's your opinion about otters?'

M'Nab looked up keenly, then scowled an unveiled scowl at the keeper. 'I reckon they're the nicest animals we get about here, sir,' was his whole-hearted opinion.

'And do you think they kill salmon and game-chicks?' asked the laird.

The miller's eyes were open very wide; then he uttered an exclamation of disdain. 'I call to mind when I was a lad there were a hundred salmon for every one to-day,' he said. 'And otters—why, sir, I've seen this yer dam fair stiff with them! We reckoned they came here for the eels and the frogs; but salmon—tush!'

'And I agree with you, M'Nab,' said the old laird; and so it was decided, to the keeper's chagrin, that the otters should be left alone.

IV.

That day the four otter kits fully opened their eyes. They were now seven weeks old, but as yet no ray of light, no breath of heaven, had entered their dwelling. In the tomb-like stillness and darkness of the den they had grown and matured, and to-day they showed for the first time a desire to escape from their prison.

Thereupon the mother-otter set to work to construct a back entrance. She dug almost vertically to within an inch of the earth's surface; then, when darkness fell, she completed the tunnel, emerging in the centre of a willow-bush twenty feet from the water's edge. Now she carried out her kits, and during the silent, moonlight hours of the nights that followed, she allowed them to grope their way back and forth through the twisted stems of the willows.

On the fourth night the male otter turned up, and seemed anxious to view his family; but his wife forbade him to go anywhere near them. On the fifth night the mother picked up one of her cubs, and placed him on her shoulders, where he hung on eagerly with his tiny forepaws round her neck. Thus she took him to the water's edge, and gliding in, began to swim, at which the kitten squealed in terror and promptly lost his hold. Once in the water, panic seized him, and he might, indeed, have drowned had not his mother nosed him gently ashore.

That night each of the kits received its baptism, and none of them liked it any better than the first. The next night the female took them a tiny eel, and though they were greatly interested in its wriggling efforts to regain the burn, none of them possessed the haziest notion of eating it. In vain the mother took it up, dropped it, mouthed it over, and dropped it again by one, then another. At length the strongest kit, following her example, took the eel by the head, and it wriggled out of sight. The cub looked much surprised—he had eaten his first fish, though I don't believe he knew it! Before dawn each of the cubs had made the same desirable mistake, and the following night much of their fear of the water was gone.

From that date onward the training of the kits developed rapidly. Each night now they accompanied their parents in the pool, swimming from one to the other, and climbing aboard a parental back when tired or afraid. The male otter shared almost equally in their upbringing, but it was long before any of the youngsters would follow the example of their parents by diving below the surface. This came by degrees, inch by inch; and once again the parents added the necessary stimulus by showing the cubs that a delightful feast of miller's-thumbs and crayfish was always obtainable in the shallow water for those who chose to dive.

Thus, step by step, the schooling proceeded, till the kits had learnt to corner and catch the

flashing trout and salmon-par, to dig their heads in the sand of the dam-bed and grope for lurking eels, or even to lend a hand in the rounding up of a kingly fish. Weasels they may have been, yet how different from the musk-bearing weasels of the land these restless, darting, playful things! Life was a great joy to them, and in their dispositions there was none of that murderous, vicious, snarling sin that characterises to the very core their nearest cousins. Certain it is, moreover, that they rejoiced in their angling as much for the sport of the game as for the food it provided.

V.

Under the rustic bridge there basked throughout these sultry days a mammoth trout. The old laird had watched the fish closely, and now he remarked to his keeper, 'I think there must be something in the old miller's belief about otters living chiefly on eels and frogs. That's the best trout in the pool, but they haven't harmed him yet.'

'Just happens they haven't come across him, sir,' growled the keeper. 'But you mark my word. One morning he won't be there.'

The old laird pondered. 'In that case we shall know the otters spoil the fishing,' he answered, 'and you can get to work with your otter-traps.'

The keeper counted on this, and the big trout might, indeed, have disappeared but that it was never there when the keeper passed with his gun. Then fortune played an unexpected card into the man's hand. One evening he and his employer were standing at their accustomed place on the rustic bridge, when suddenly an otter reared up from the centre of the dam, looked all around, then silently sank again. A second later the mother wild-duck who had sat her eggs patiently on a mossy bank above the pool for an endless string of days, essayed to lead her newly hatched brood across the dam.

The old man was overjoyed to see them. He had striven for years to induce the wild-fowl to become resident here, and now, at last, he saw a gleam of hope. 'Nine!' he exclaimed. 'All hatched but one. Do you think they will remain, M'Queerie?'

'No-o, sir!' growled the keeper. 'I think them otters will take the whole brood before they're three days old.'

Scarcely had he spoken when there was a mighty swirl in the centre of the group of ducklings, and when it had subsided there were only eight. Again a swirl, and now there were only seven—each paddling for dear life after the desperately anxious mother.

'What did I tell you, sir?' cried the keeper, with something that suggested triumphant gratification. 'That's an otter, and there won't be a duckling left by morning!'

The old laird thumped the rustic rail with a force that hurt. 'Then get to work with your

guns and traps!' he roared. 'Get to work at once, and let's be rid of the otters.'

The keeper went his way content—happy chiefly in the achievement of having triumphed over old M'Nab.

VI.

That night the she-otter came down from her den, and slew the mighty trout beneath the bridge, eating only the choicest part, and leaving the rest to drift away. Presently she called her cubs, and led them off to the shallow water on another joyous crayfish-hunt, but scarcely had she set her feet on the gravel bank when—'Clank!' A steel trap held her fast.

In vain she fought and wrestled with the hateful thing, while her cubs swam back and forth, whistling, clucking, screaming, snorting. Her mate was high up the cañon, fishing on his own; but at that very moment he turned his head homeward, and a strange, unreasoning panic fell upon him. Over the weirs he came, through the crystal, foam-flaked pools, sliding, gliding, between the rocks, downwards, over, and on, swifter, even, than ever before. So he reached his mate, and tried to call her away; but she would not come. He splintered his splendid teeth upon the trap, gnawed at it, snapped at it, rolled on it, tried to bury it; he whistled and screamed and snorted; he bit at the tree-roots in his uncomprehending fear; but the awful night dawdled by, and the beautiful creature in the trap remained a prisoner.

Next morning the old miller was up early, for from the activities of the otters he pictured his drift full of kingly fish. The old man at the castle also was up early, for the otters had kept him awake, and he wanted to see what had happened. But earliest of all was the keeper, and he took his gun.

He found the she-otter lying still, her poor imprisoned foot all torn and bleeding, but her wonderful coat unruffled. He took his place under the trees, his shot-gun ready, for he knew that ere long her mate or her kits would come back to her. And waiting coolly thus, a foot-step suddenly startled him, and he turned to see the laird approaching.

The lonely old man from the castle looked down at the lovely creature in the trap, lovely even in its fear and resignation—looked at those cruel toothed jaws that held the pulped and bleeding flesh, and swore solemnly under his breath. He turned on his keeper, and for once the weak chin was squared, the expressionless gray eyes bore some expression.

'Why don't you kill her?' he inquired with awful brevity.

The man rose somewhat shamefully. 'Waiting to shoot her mate, sir,' was all he said.

The laird bit his lip. 'You sit calmly there and let her torture to death'—he panted out; then words suddenly failed him. He clenched

his hands and turned away. 'Kill her!' he cried. 'Kill her now.' And he turned to watch it done.

The keeper took up a club and approached the trembling, watching, little mother of the woods. On the banks the syringa bloomed; the scented breeze of the summer morning seemed to say that the world was clean and new. In a second the awful deed would have been done, another lovely and gentle creature of God's own making done to death—shattered out of existence because man has taken to himself the things God gave that creature as its birthright. Another second, and the club already raised would have driven the lustre from those waiting eyes; but now, in the very ace of time, a bent and tottering figure appeared upon the bridge, holding aloft a giant trout. It was M'Nab!

'Here, hold on! hold on!' he cried, shuffling into an awkward run. 'Here's the chap that took the ducklings! I found them inside him, and here they are! He'd have killed the whole brood if the otters hadn't killed him first.' And the miller uttered a crazy laugh.

The laird looked at M'Queerie. 'Open that trap and let the otter go,' he ordered.

The keeper sullenly obeyed. The otter moved slowly away and slid into the water. Then the old laird spoke. He spoke at some length concerning steel traps and the way men use them, and at length he finished up: 'We'll leave the otters alone, M'Queerie. If any man on this estate raises a finger against them—that man goes.'

And while the keeper strolled sullenly away, the old man from the mill, still holding triumphantly aloft the giant trout, grinned with such a grin of conquest that M'Queerie could feel it, though he could not see it.

Late that night the she-otter mounted the slippery stump, and showed her bruised and bleeding foot to her mate. He seemed disturbed and anxious. Away up-stream he went, calling to her, calling the cubs; and into the secure cañon-mouth they went, rolling and splashing, their pains and sorrows forgotten as the friendly shadows closed upon them.

OUR HILLS OF DREAM.

THE morn is sad and still;
Cold winds drift from the sea;
Yet o'er you purple hill
Larks carol cheerily.

So dwells within my heart
The clean glad thought of thee;
So, when hot tear-drops start,
Our love sings joyfully.

Though sad this world may seem;
Though winds drift from the sea;
Yet o'er our Hills of Dream
Love sings eternally.

THE INNER CIRCLE.

By LLOYD WILLIAMS.

PART I.

I.

THIS story concerns three people—her ladyship, her ladyship's daughter, and the kennel-maid. There is also a man in it.

Her ladyship was one of those gentle, placid women who appear to have no force of character, but who yield nothing. She was a little over forty years of age, and inclined to be stout in spite of 'treatment.' At the close of the Victorian era she was a 'beauty,' and she still had a claim to good looks. She was fair and round-faced; her hair fluffed, and would probably go on fluffing even when she was gray; and her manners were everything that manners ought to be.

But she happened to be one of those women who learn nothing from life. Marriage and motherhood had passed over her, and left her just where she stood before—a person of small, narrow opinions, founded on sheer convention, and apparently totally incapable of expansion.

Even the war had not touched her. She had 'worked' according to the fashion, and had paid an enormous sum in income-tax without complaint; but now, when the war was over, she believed that she and the world still stood exactly where they did in July 1914.

The Honourable Gladys Lucy was different.

She was only eighteen, and had all her mother's claims to beauty, and something added, of which her mother knew nothing. There was an eager wistfulness in her young eyes, that longed to know the wide world into which she had been born.

Gladys was as ignorant of life as her mother, but for a different reason. The Countess of Deal had had a chance of learning something from the great book of experience, and had obstinately refused to believe a word of it. Her daughter had never been allowed to turn a page.

She had never been to a school, because she was an only child, and was considered too precious to mix with common clay. Her young mind had been moulded by a succession of governesses, and through their eyes she had caught peeps, as it were, of life and the world outside.

Finally, there was the kennel-maid, a person who, in the eyes of Lady Deal, was of no importance whatever.

It was her duty to look after Don Juan II. and III., Forward Beauty, Princess Charming, and a Noah's Ark full of Pekingese quadrupeds, together with their offspring.

Helen Smith occupied a small cottage, which stood about a quarter of a mile from the Hall. Adjoining were the kennels where the Pekies lived. They were like delightful dolls' houses in an elaborately-built-in house, with a tiled floor. A good many human beings would be thankful to find themselves in such comfortable quarters.

One morning Smith, the kennel-maid, was exercising the 'establishment' in a paddock near the kennels when Gladys strolled past. Smith knew her place, and did not offer to speak, though the girl stood by the rail watching the small dogs and their attendant with dreamy eyes.

Gladys was not at all an aloof young person. On another occasion she would have entered into animated conversation with Smith; but, like many girls of eighteen, she had moods of dreaminess. She might, for instance, have been thinking about the cut of a new frock while she stared at the dogs. Smith, attending to her own affairs, would have been surprised had she known that Gladys was thinking to herself, 'What a wonderfully capable sort of person Smith is! I wonder if she understands humans as well as she understands dogs, and could help me.'

Smith was a woman of, perhaps, sixty. She was tall and slender, with a thin, dry, rather hard face. Her eyes were gray-blue, and at odd times there was a hint of shrewd humour in them. She knew her place, and never in any way pushed herself forward; but she did not make friends with the other servants, and lived her life in quiet seclusion.

There was something about Smith that held Gladys's inquisitive young mind. She dressed with a kind of tasteful sobriety that seemed to mark character, and the girl sometimes wished she could see the inside of her cottage. She had a notion that it was different from what you might expect a kennel-maid's cottage to be.

However, Gladys was not in a talkative mood at the moment, and she turned away with a faint sigh, and went up to the Hall.

II.

'Busy, mother?'

'I'm always busy, my dear.'

This was true. The countess was invariably 'busy' with something that was hardly worth while, but she was entirely convinced that no one else in the world could do it as satisfactorily as herself. Just now she was arranging carnations in various vases. Before luncheon the head parlour-maid, who was far more skilful than her mistress, would rearrange them. But the countess would be oblivious of the fact.

'Mother, I want to ask you a question.'

Her ladyship frowned. 'I have no time to waste, Gladys. What is it?'

Gladys was always asking astonishing questions, and her mother was always evading the answers. It did not occur to the woman that in suppressing a young girl's thirst for information she was running a grave risk.

On this particular morning the girl opened up an entirely new field of discussion. She had exhausted so many that her mother often wondered what 'put such things into her head.' The countess herself had never read what could fairly be called a 'book' in her life; but Gladys read everything she could get out of the *Times* library, and the countess would have been astonished at the width of her daughter's inquiries if she had kept her wits about her.

'What happens, mother, when a woman marries out of her station?' asked the Honourable Gladys suddenly.

'Women of our class never marry out of their station,' said the countess firmly.

This was a lie; and the girl knew it was a lie. It was one of mother's favourite devices to deny a truth flatly, and so persuade herself that it was a figment of the imagination.

'I think you are wrong, mother,' said Gladys. 'There was Lady Frayne, who married her motor-man, and Sybil Smyth, who ran off with an actor. Of course'——

'Women of that sort are not in our station,' said the countess. 'And I prefer not to discuss the subject. Be so good as to go to the conservatory. You will find Rolls there. Tell him I want another dozen carnation-blooms.'

The girl walked away with a faint curl of scorn on her lips. She was as honest as young people are apt to be, and her mother's talent for stifling honest inquiry was winning her hearty contempt. If a child asked you what the sun was made of, it would be a poor answer to reply, 'There isn't a sun.'

Gladys gave the order, but did not wait for the blooms. On her way back to the morning-room she passed through the little gallery, and here by some chance a particular picture caught her eye.

The Lucy family had always had a passion for having their portraits painted, and successive generations of wives had done nothing to miti-

gate this distressing malady. The result was that the main gallery was already overcrowded with ladies and gentlemen in different periods of fancy dress, and present-day members of the family were driven to the little gallery.

'In another century or two we shall be hanging our portraits in the stables for want of room elsewhere,' Gladys had been known to observe. 'And a very good place for some of us, too.'

There were several portraits of her mother in the little gallery, but the girl did not glance at them.

It was a small portrait in a darkish corner that held her attention that morning. Beneath was a label: 'Honourable Seymour Lucy.'

To judge by the costume, the Honourable Seymour must have been a young girl in the early 'eighties. Perhaps it was not exactly a beautiful face; some men might even have declined to pass it as 'pretty;' but for Gladys it had always held a fascination. Oddly enough, there was a look of herself in it (though the Honourable Gladys was far better looking than her father's eldest sister had ever been), a wistful look of inquiry, that seemed to be asking what this strange world had to offer a girl.

Her ladyship's daughter stood in front of her aunt Seymour's portrait for quite a long time, frowning as she had a way of doing when perplexed. Then she went to her mother with a new question on her lips—a question that she had never yet ventured to throw into words.

'Mother, there's something I want to ask you.'

'What is it?' asked the countess.

'What did Aunt Seymour do that can't be talked about?'

There is a dark cupboard in almost every family, even the highest, and the ghost of Aunt Seymour inhabited the Lucys' cupboard. It was an unwritten law that her name must not be mentioned, and Lady Deal stared at her daughter out of those babyish unintelligent eyes.

'I don't know what you mean,' she said.

'I think you do, mother,' said her daughter.

'Where is Aunt Seymour? Is she dead?'

'Not that I know of.'

'But what did she do that mustn't be spoken of? Did she run away with—with any one?'

'I decline to discuss the matter,' said her ladyship with some dignity. After all, this was a most effectual way of stifling tiresome inquiries. 'A girl of your age would not understand such things.'

The girl smiled. She had read many books, and pondered over many queer things; she had picked up ill-guarded tittle-tattle from maiden governesses, and fancied she knew a great deal, as young people so often do.

And she declined to drop the subject.

'Have you ever seen Aunt Seymour?' she asked.

'Never; and I have no wish to. She ran a—— She disgraced herself before I knew your father.'

'But what does she live on?' asked the girl.

'Has she any money?'

Here her mother stared at her in contempt. What a silly question to ask! There had never been a Lucy, male or female, who was not amply provided with money.

'Your aunt would naturally have her own private fortune,' she said coldly. 'Be so good as to ask no further questions. I can hear Holbrook coming.'

III.

A parlour-maid entered with the carnation-blossoms given to her by Rolls, the head-gardener, and Gladys glided away with a sigh of discontent. It was always the same. You must never discuss anything that mattered—religion, politics, social problems were all flatly forbidden.

But you might talk about downright silly things by the hour—fashions, vapid novels, the discontent and ill-behaviour of the villagers, and sundry other purely artificial subjects.

Her mind was still full of the portrait of her aunt Seymour; she thought of that strong, thoughtful, wistful little face with the deep eyes. Was Aunt Seymour baffled at every turn when she tried to understand the life she was living? Was that why she became a skeleton in the family cupboard?

Presently a footstep sounded on the gravelled path below. Gladys was standing at the top of the steps beneath the portico, leaning against one of the columns, and forming a prettier picture than she knew. She had not heard the step, and did not move.

Smith, the kennel-maid, had come up to the Hall, and stood there for an instant, looking at the drooping figure of the young girl with a faint smile.

What followed could not have happened in different circumstances.

'Will you give a message to her ladyship, Miss Gladys?' said Smith. 'Don Juan the Second doesn't seem to be well.'

The dreamy, preoccupied girl did not, perhaps, hear the actual words, but her eyes sought Smith's face, and suddenly her graceful young figure came to life. She advanced down the steps slowly, and as she descended Smith's face gradually flushed, so that it looked younger than her sixty years. Smith retreated a little. But Gladys had reached her now, and had seized her by the shoulders.

'You are my aunt Seymour,' she said under her breath.

The moment she spoke Smith recovered her cool manner. 'That is quite true, my dear,' she said. 'I recommend you to keep the information to yourself for the present.'

With that she turned away, and the girl stared after her with puzzled, wistful eyes.

IV.

Here was a delightful mystery for an inquiring mind. Gladys Lucy tried to rearrange the facts of her existence.

Hitherto the world had consisted of a ringed enclosure, within which she and her mother, the royal family, the House of Lords, and a few score of equally select mortals moved about and had their being, and—the people outside the ring.

The people who were outside the ring had always interested the girl enormously, far more than the people inside the ring. She had had delightful peeps at their lives. There were cottage folk, railway servants, and up in London there were miles of streets inhabited by people who were also definitely outside the ring. Then, too, there were the soldiers. During the war she had managed to secure a good many shy peeps at the soldiers. In London a female cousin had taken her more than once to a hospital where she worked as a V.A.D.

It was no end of a mix-up. She had seen a Tommy who was the grandson of a duke, and inside the magic ring, although he chose to be a Tommy, and swore in the most horrifying way in delirium; on the other hand, she had sat by the bedside of a lieutenant-colonel whose mother kept a boarding-house in Russell Square, and was definitely outside the ring.

And now her own aunt was outside the ring. She was a kennel-maid, and lived in a tiny cottage belonging to the Lucy estate. She had 'done something' that placed her beyond the pale, something that could not be mentioned to a 'young girl.' To be sure, her portrait still hung in the little gallery; but that did not go for much. When the Lucys had once succeeded in hanging a portrait, they never took it down again. Nothing short of an earthquake would dislodge the thing.

The point that interested the girl at the moment was, 'Did Aunt Seymour climb over the ringed fence, or was she pushed out?'

There was another point.

'Suppose I climbed out?'

That thought brought a puzzled frown and a shy blush to her face. But it did not prevent her taking tea with Aunt Seymour at the first opportunity; indeed, it urged her to it.

And the inside of Smith's cottage was remarkable.

Although the owner was outside the ring, the cottage looked, somehow, as if she were still inside. It was utterly delightful; everything was right and appropriate. Aunt Seymour had not furnished her little home as if it were a sham mansion; it was a cottage, but the most perfect, lovable, delicious place in the world, with old oak cottage furniture, and choice little prints on the walls, and the most delightful curtains at the tiny windows. And the dresser—there was a real dresser instead of one of your pretentious sideboards—was hung with blue china that made Gladys want to dance with joy, for she knew a little of its value.

'Come and sit down, my dear,' said her aunt. 'I have to do all my own work, but you shall

make some toast, if you like. One of the charms of living the simple life is that you are not troubled with maid-servants. I wonder what made you jump to the conclusion that I was your father's sister.'

Whereupon Gladys told her of the picture that hung in the little gallery.

v.

For a long time they talked of inconsiderable trifles. They were like wary fencers, watching for an opening, each shy of lowering her guard first.

It was not till tea had been discussed, and Aunt Seymour could take her seat opposite to her niece by the fire, that the buttons were removed from the foils.

'Your eyes are asking me a thousand questions, my dear,' said 'Smith' with a smile; 'and the first of them is: What is my story? I shall tell it to you, though I dare say a good many people would not consider it suitable for a girl. Once upon a time'—

She told her story, with a light accurate touch, without sentiment, and yet without concealing its inner meaning. There were no tears in her eyes, but curiously enough there were tears in the girl's.

'And you have lived a lonely life ever since, auntie?' she whispered.

'Ever since. That is the way a woman pays. I have seen something of the world, but as old age creeps over one, one begins to long for kith and kin. I thought of you, though I had never seen you. Your father was my favourite brother, though there were nearly twenty years between us. I had a feeling I should like to see my niece blossom into womanhood, and here I am.' Aunt Seymour paused and smiled. 'I left the enclosure to which I belonged, and now I belong to the outside world.' After another pause, she added, 'It is really quite an instructive story, my child, and I wonder if confidence begets confidence. What would your mother say if she knew you were here, for instance?'

'Mother's a fool,' said the girl coldly.

The slim, elderly woman on the other side of the hearth stiffened a little.

'We don't say those things, my dear, even if they happen to be true,' she remarked. 'I broke one commandment, but I still have a respect for the fifth.'

The girl sat back in her chair with a set face. 'Mother has never grown up,' she said. 'She is still a child in the middle of Queen Victoria's reign. I cannot talk to her.'

'Could you talk to me?'

The girl looked across at the narrow, earnest face wistfully. 'I think so, but'—she covered her face with her hands—'you will laugh.'

'I think not, dear. People who have lived stories—even though they are not pretty ones—seldom laugh at other people's. Suppose we sit closer.'

She took a chair by the girl's side and insisted on holding her hand.

vi.

Yes, it was a strange story, perhaps the last story that one might have expected. Perhaps, too, it was laughable, but the listener did not laugh.

There was a young man in it—naturally. His name was John Merriman, though he was spoken of as Jake. He had been a 'Tommy' in the war. Gladys had made his acquaintance in a hospital when she was visiting a V.A.D. cousin, and in some wonderful way shy exchanges of confidence had ripened into affection.

'We are engaged,' said the girl quietly. 'But I don't wear a ring openly because of mother.' She touched the bosom of her blouse, and added, 'When he is ready, I shall go to him.'

The Honourable Seymour Lucy looked at her niece for an instant and was silent. She would do what she said she would do. It was a constitutional infirmity of the Lucys that they kept their promises. Their motto was, '*Dixi*.' Aunt Seymour was silent, because she knew she might as well invite the west wind to blow from the east as request the girl to think it over. The Lucys never 'thought things over' until afterwards.

'What sort of young man is he, my dear? Is he quite impossible?'

'Quite,' said the girl frankly. 'It's no good to talk about it. It sounds laughable. But that makes no difference.'

'Well, we'll laugh together. What is his calling?'

The girl turned reddish, but her eyes were defiant.

Mr John Merriman was an assistant in a grocer's shop.

Some things are too absurd for daylight discussion. If he had been a bank clerk or a stock-broker, a schoolmaster or a mechanic, it would have been 'impossible'; but one might have discussed it. But there was something dangerously near to the ludicrous in the Honourable Gladys Lucy proposing to marry a young man who wore an apron, and cut up bacon in Clutton's shop at Little Westering, and—

But no, it wouldn't bear talking about. We are a nation of shopkeepers, but we are mysteriously ashamed of our proclivities.

Gladys rose and put on her toque.

'Thanks for having me, auntie. May I come again?' she said in the even tones that come of generations of good breeding. 'I'm not going to ask you not to tell mother, because it might only create ill-feeling, and make no difference in the long-run. I'd love to kiss you.'

'I sha'n't let you go until you do,' said the Honourable Seymour Lucy with a smile.

(Continued on page 201.)

ANOTHER CHAPTER FROM THE DIARY OF A JOURNALIST.

By Sir HENRY LUCY.

LADY RIDLEY.

March 22, 1899.

THE death of Lady Ridley, the latest victim to the plague of influenza, has saddened London society. She was one of the sweetest-natured, prettiest-mannered of the ladies who adorn it. In every way the most richly endowed hostess in London, she, from the opening of the season, looked forward to excelling herself. A day or two before she was stricken down she sent out cards for an unusually prolonged series of festivities. 'Lady Ridley at home,' the invitation runs, 'Saturdays, February 18 and 25, and Saturdays in March.'

To-morrow is the third Saturday in March, and truly sweet Lady Ridley is 'at home.' But there is only one guest.

The day is fixed that there shall come to me

A strange, mysterious guest;
The time I do not know; he keeps the date;
So all I have to do is work and wait,
And keep me at my best,
And do my common duties patiently.

So we pass out, my royal guest and I,

As noiseless as he came;
For naught will do but I must go with him,
And leave the house I've lived in closed and dim.
It only bears my name;
I've known I should not need it by-and-by.

The profoundest sympathy is felt with the Home Secretary. Those privileged to know Lady Ridley as a friend can most nearly, but only vaguely, feel the immeasurable, irreparable loss to the closest companion of a long and happy married life.

NO. 5 JOHN STREET.

45 MECKLENBURGH SQUARE, BLOOMSBURY,
April 5, 1899.

MY DEAR LUCY,—It is very good of you and Mrs Lucy to show such friendly interest in the success of my book [*Number 5 John Street*]. I must say that though I had hopes at the beginning, I ended with fears on the eve of publication, and that the result was as great a surprise to me as it has been a delight to my friends. The papers have been more than kind; the publisher has now ordered his seventh thousand. What more can I desire than that the public may continue in the same laudable frame of mind long enough to give me my place among the writers of the day?

Yes, there is still something left to wish for, and that is an equally favourable verdict from America, where the Century Company has purchased the copyright. Good luck all along the

line may have precious results for me.—With kindest regards to *chère* Mrs Lucy, very sincerely yours,
RICHD. WHITEING.

TOM ELLIS.

April 14.

The funeral services in connection with the death of the late Liberal Whip, Tom Ellis, testified, alike at Bala and at Westminster, to the sterling worth of the man. His career was one that did honour to himself and credit to the system of public life that made it possible. In an ordinary way the post of Parliamentary Whip is one of the appanages of the peerage. On both sides it has been the custom to promote to vacancies either the younger sons and brothers of peers, or scions of great territorial houses still ranking with the commonalty. Tom Ellis was the son of a tenant-farmer. When invited to contest the county of Merioneth, he frankly said he had invested his patrimony in his education, that he was willing to give his services if they were called for, but some one else must find the money.

On those terms he was elected, and in surprisingly short time made his way to a position in which he became the confidant of Cabinet Ministers, the trusted agent of a great party. His death at the age of forty is a calamity to his friends, an irreparable loss to the Liberals. Not so for him. After all, there is some recompense in dying before you have had time to make a mistake or be met by adversity.

As one of his colleagues finely said by the graveside among the Welsh hills, 'Tom Ellis died in France last week. He will never die in Wales.'

JOHN HOLLINGSHEAD.

April 20.

At the inauguration of the Great Central Railway at Marylebone Station to-day I came across John Hollingshead. After a life of varied labour and experience equalled by few, he might pass in a crowd for a man just turned fifty. But he recollects quite well how, sixty years ago, he made his first railway journey. He travelled as a third-class passenger, and having taken his ticket, was shown the way into an open truck, which when not in use for passenger traffic carried coals, cattle, or anything going its way. For the convenience of the passengers one side of the wagon was let down, making a gangway by which they entered the van. When the train was about to start the side was lifted up, more or less securely hooked, and the train rumbled off at fully twenty miles an

hour, third-class passengers jolting on springless wheels.

If it snowed, or rained, or blew the stout north-easter that Kingsley (comfortably writing in his study) greatly loved, they had just to put up with it to their journey's end. There were no means of shelter. Sitting in one of the sumptuously appointed third-class carriages of the Great Central Railway, hearing a man recall these early experiences, brought more vividly to the senses the enormous strides made by railway enterprise during the last half-century than would the study of innumerable tomes of history.

MR COURTNEY.

May 2.

Henry Fawcett, who, in spite of his blindness, lived to be Postmaster-General, from time to time amazed and interested the House by *tour de force* in the way of speech-making. He could, with apparent ease, speak for an hour—of course, without the assistance of notes—on the most abstruse subject. Since he disappeared from the scene nothing so marvellous has been achieved till Courtney spoke to-night on the Budget. All is not absolutely dark to him, as it was to Fawcett. He can walk about unaided, and recognises his friends and acquaintances. But he cannot see to read or write, and is unable to count upon the assistance of notes in making a speech. To a practised debater that, on ordinary occasions, would not greatly matter. When it comes to dealing with the Budget statement notes are indispensable, even to a Gladstone.

To-night Courtney met the difficulty in a fashion that adds to the marvel of his success. He brought his speech fairly written out in the handwriting of his wife. He handed the manuscript to Hobhouse, who sat next to him below the Gangway. As he spoke Hobhouse followed the manuscript, prepared to prompt him if necessary. For an hour and twenty minutes Courtney went on, dealing with a mass of figures and conducting an elaborate argument. Only once, and that after an hour had sped, did he hesitate and turn to his prompter to get his cue.

As a feat of memory this is even more remarkable than Fawcett's everyday doings. He studied his subject; then, out of the sometimes fatal fullness of his vocabulary, he made his speech. Courtney dictated his speech in his study, probably had it once read over to him, and recited it with an accuracy only once at fault.

DUKE OF CAMBRIDGE.

May 4.

Last night met the Duke of Cambridge at a private dinner given by the high sheriffs of Surrey in the storied hall of one of the city companies. The duke is now in his eightieth year, and would perhaps be better quietly dining at home. But he shrinks from the prospect of absolute retirement. So he goes out dining still,

a pathetic figure with his bowed back, his blue ribbon of the Order of the Garter, and his mechanical method of walking round a room when he enters it, and shaking hands with people he thinks he knows.

He made a speech in response to a friendly toast, a kindly loyal speech, telling us all to be true to the interests of the Empire. There was danger of his breaking down when he referred to the army and his being no longer responsible for its command. But he brisked up again when he went on to affirm, what it is pleasant to know he fully and firmly believes, that the present efficiency of the army is entirely due to his personal initiative and exertions, and that his successor can scarcely be expected to maintain it.

GLADSTONE.

May 17.

Leaving the House of Commons at close of sitting to-day, I came upon a pathetic sight. In Palace Yard, in front of the entrance to Westminster Hall, stood a wagon to which were harnessed two heedless horses. On the cart lay a great mass covered by a white cloth, showing the outline of a gigantic human figure lying helpless on its back. It was, the policeman told me, the statue of Gladstone on its way to the pedestal in the central lobby, where to-morrow it will be unveiled.

I thought of the many times I had seen him walking with springing step past the place where the great dumb figure lay prone on the cart. Almost exactly two years ago I stood there among the bareheaded crowd watching the coffin borne out of Westminster Hall to be carried to its last resting-place in the Abbey. Already two years gone! And in the meanwhile the world has plodded on pretty much as it did.

ARTHUR BALFOUR 'A DUFFER AT GOLF.'

May 19.

Arthur Balfour is just now the hero of a little story which no one enjoys more than himself. He makes a habit, broken through only for imperative State reasons, of spending Saturday to Monday with friends in the country. Last Sunday he was one of a house-party at a well-known place where the park encloses a golf-links. A game was proposed in the afternoon. He demurred, on the ground that, whilst he saw no harm in the exercise, it might give public offence if news went abroad of how he had spent his Sunday afternoon. Assured that he might enjoy the exercise without fear of being observed, he joined in the game.

Presently there appeared on the scene a group of villagers exercising their immemorial right of passing through the park. Balfour was much annoyed, lamenting the hard case of a public man who ever paid the penalty of his position by forfeiting the rights of privacy common to the

humblest citizen. If he were plain Mr Balfour, of the city or the suburbs, he might take a little desirable exercise on a Sunday afternoon, and no one would be the wiser or the sadder. The case was different with the First Lord of the Treasury, Leader of the House of Commons, one of the most prominent men in public life.

He was consoled by a fellow-guest who, standing near the group of onlookers, overheard the conversation.

'Who's 'e?' one asked, pointing to the future Premier.

'Don't know,' replied the other. 'Anyway, he's a duffer at golf.'

CHAMBERLAIN AND THE REFORM CLUB.

May 31.

Looking up Mr Chamberlain's record in the indispensable volume *Who's Who*, I find it stated that he is a member of the Reform Club. Many years ago he resigned his membership in circumstances that make the incident memorable. When his brother Richard was elected Member for West Islington, standing as a good Liberal, he was, as a matter of course, put up as a candidate at the Reform Club. The animosity towards 'Joe,' which that strong personality has in all the varied circumstance of public life succeeded in evoking, found expression in more than sufficient black balls to keep the new M.P. out.

Mr Chamberlain, incensed at this rebuff, forthwith resigned his membership, and has never since entered the stately hall of the Reform. It was said at the time that this incident, rankling in his mind, had something to do with his secession from the Liberal Party, which followed within the space of a few months. One sometimes sees his son Austen at the Reform. That is a chance visit, paid on the occasion when the Devonshire is undergoing its annual cleaning, and its members are temporarily housed at the Reform.

FR WALLACE, M.P.

June 7.

Last night Dr Wallace, Member for East Edinburgh, died almost in presence of the House of Commons. The tragedy is infinitely deepened by the circumstances that attended it. Occasionally there appear in the reports of coroners' inquests accounts showing how the police have been hopelessly in doubt on the question whether a man picked up in the street was drunk or dying. Poor Wallace, stubbornly struggling in the grip of death, was for some moments regarded by the House with the angry impatience reserved for one who has too freely dined. He had long established himself as a prime favourite in debate. He had a style and humour entirely his own, a sarcasm made more mordant by his stolid attitude, his deep, rolling voice, and his grave countenance. When, towards half-past eleven, he rose, the House, worn out with

long debate and eager for the division, immediately assumed an attitude of pleased expectation. There was sure to be some fun with Wallace on his feet.

As usual, he had prepared notes of his good things, and at the outset got on well enough. At the end of five minutes his voice broke. Members, looking up to see what was the matter, observed him groping in futile search of his eye-glasses. His body swayed to and fro. He seemed as if he would fall over the bench by which he stood. Indubitably drunk was the general conclusion. Members sitting near attempted to assist him to resume his seat. One hastily handed him a glass of water, spilling it in passing it over the shoulders of Harcourt, seated on the Front Opposition Bench, who was naturally exceedingly angry that the vagaries of a diner-out should incidentally subject him to this annoyance.

In other parts of the House resentment was felt and expressed only in less open manner. It was all very well, by no means an unfamiliar thing, that at this time of night, especially in sultry weather, after-dinner effects should manifest themselves in debate. But, really, for a man to get up, catch the Speaker's eye, begin a speech, and then become incoherent, even tottering, was too much. Meanwhile, amid angry cries of 'Order! order!' Wallace sank back on the seat a huddled heap, to be carried out, practically a dead man, in the arms of stalwart John Burns.

It was a pitiful ending to the tragedy of a lifetime. There are few men in the House of Commons who could compete with Wallace in pungency of debating power, fewer still in depth and scope of scholarship. He might have won his way to the highest position. Having filled more than one of high renown, he sank to the level of the applicant for a coronership.

His nearest parallel in intellectual capacity to be found in modern times is Robert Lowe, whom in his parliamentary gifts and attitude Wallace much resembled.

FROM SIR JOHN LUBBOCK.

June 29, 1899.

MY DEAR LUCY,—Many thanks for your note.

It is as you say. When I found that the contest on municipal trading was likely to turn in part on the telephone, I sold my shares.

I was rather sorry to do so, as I have always felt some pride in having taken a part in introducing the telephone and the electric light into this country. I hesitated, as I thought no one could suppose that the trifling difference which the Bill might or might not make on a few shares could influence one's judgment.

However, on the whole it seemed better to sell, and I need not say that I am now very glad I did so.—Yours very sincerely,

JOHN LUBBOCK.

THE PARTS MEN PLAY.

CHAPTER IX.—*continued.*

v.

ONE evening, after dressing for dinner, Selwyn found that he had half-an-hour to fill in, and as the smell of grass was scenting the air, he sauntered from the house and strolled across the lawn to a path which led to the trout-stream.

His mind was drowsy with a thousand half-formed thoughts that lazily lay in the pan of his brain waiting the reveille of thought. A skylark twitted earth's creatures from its aerial height. A cow, munching in endless meditation on its unfretful existence, emitted a philosophic moo.

Selwyn smiled, and let his mind wander listlessly through the fields of his impressions. He thought of Britain, and wondered what there is in the magic of that little island that fastens on one's heart-strings even while the brain is pounding insistent criticism. For the first time the insidious beauty of Roselawn's tranquillity was cloying the energy of his mind—a mind that never gave him rest, but was always questioning and seeking the truth in every phase of human endeavour. The peacefulness of the twilight hour was lulling his mental faculties, and the perfumes of summer's zenith were stirring his senses like music of the Nile.

As though he were picturing inhabitants of another world, he conjured to his vision the feverish traffic of New York, deluged with human beings belched from their million occupations into the glare of lunch-hour. It gave him a strange sensation of being among the gods to be able to look at the lowering sun and know that at the same moment it held New York in the pitiless heat of midday. . . . And he wondered dreamily why people lived such a mockery of existence as in its towering streets. The pastoral atmosphere was so perfect, so completely soothing in its cool fragrance of evening, that he thought if he could only remain there, away from the conflict of the world, he could write of such things as only poets dream and painters see.

He had reached the stream, and was about to retrace his steps, when he heard the rustle of a dress, and coming round a bend in the path he saw Elise Durwent. She was in an evening gown that looked oddly exotic in those surroundings, and, still in a haze of reverie, he stood in perplexed silence until she stopped opposite him.

'Have I interrupted the muse?' she said.

'On the contrary, you have awakened it. I was just thinking how vivid you looked with that setting of overhanging bushes and the background of fields. I—I think it must have been

your gown that gave such a quaintly incongruous effect.'

'And, of course, there is nothing incongruous in a dinner-jacket near a trout-stream? If I were an artist I should paint you, and call the picture "Despondency."'

'Well,' he smiled, 'that would be an improvement on most Academy titles. An ordinary artist would simply name it "Young Gentleman by Trout-Stream." Haven't you often gone through a gallery picturing all sorts of dramatic meanings in paintings, only to have your illusions shattered by the catalogue?'

She nodded. 'You have expressed no surprise at my coming,' she said abruptly. 'Are women in the habit of tracking you in this way?'

'I'm sorry,' he answered, lazily thrusting his hands into his pockets. 'As a matter of fact you are never very far from my thoughts. Perhaps that is why I felt no surprise.'

'How are you enjoying your visit?'

'Tremendously.'

'How do you like the guests?'

'Is this a catechism, Miss Durwent?'

She shrugged her shoulders and pulled a leaf from a bush. 'I was wondering,' she said, 'whether they bored you as much as me.'

'Why,' he said with a slight laugh, 'to be frank, people never bore me. The moment they become tedious they are of interest to me as a study in tediousness.'

'Just the same,' she said quickly, 'as when a woman interests you she becomes an object of analysis. I wish I could detach myself like that.'

'And yet,' he said gently, wondering at the intensity of her eyes, 'I should have thought you possessed the gift of detachment to a greater degree than I. You always seem separate and distinct from your associates.'

She said nothing in reply, and as if by tacit agreement they started back along the path. He did not break the silence, feeling that words might be provocative of a retort that would dispel the growing feeling of mutual confidence.

'No,' she said, after a long pause, 'I do not possess the power of detachment. It's just that I don't mix well. Have you read Robert Service's poem about the men that don't fit in?'

'Yes.'

'Well, it's far worse for the women who don't. A man can go out and try to find some place for himself. We have simply to stay and endure things.'

Half in compassion he watched her from the corner of his eye, but again refrained from saying anything. He felt intuitively that she was trying to break down the barrier of impersonality, but

he knew that she must do it in her own way of timid starts and quick withdrawals.

Although her movements were more restricted by her gown than when she wore ordinary walking-garments, her vitality and limitless energy lent a lilt to her step, and even touched the shoulders with a suggestion of restless virility. When she walked there was an imperious tilt to her head; but no matter how carefully planned her toilette, or how cleverly her coiffure might have been arranged by her maid, there was nearly always some stray bit of colour or carelessly chosen flower that combined with her nature in a suggestion of outlawry: the same instinct of rebellion that had dominated her brother Dick during their childhood. Inside the house she would sometimes look, in her quickly changing moods, as if she were some creature of Nature imprisoned within the walls.

Selwyn wondered if heredity, in one of its strange jests, had recalled the spirit of the smuggler ancestor and recast it into the soul of the girl.

They were nearing the house, when, emerging upon a clearing, they came to a rustic bench looking across a short field lined with shrubbery.

'Let us sit down a minute,' she said. 'We can hear the dinner-gong from here.'

He took his seat beside her, and dreamily watched the yellow rays of the sun casting their receding tints along the bushes opposite them. It was strangely quiet, and the hum of insects seemed like a soft orchestral accompaniment to the crickets' song.

'It is not very sporting of me, Mr Selwyn,' she said softly, but with her old staccato mannerism, 'to force my mood on you like this. I did it once before—that dreadful night at the Café Rouge—and I know that you must think it is just selfishness on my part that makes me so unhappy. But—you know I never had a real friend—except little Dick—and I felt to-night as if I had lost all my courage about life. That's why I followed you. I knew you would be patient and kind.'

'My dear girl,' said Selwyn gently, speaking almost listlessly for fear the smouldering power of retort should be fanned into being, 'for months I have been hoping that some day we should be able to talk like this, as friends. Perhaps it was my fault, but there always seemed a sort of third-person-singular attitude in our talk, as if we were speaking *at* each other, which served to block our friendship from becoming anything of value to each other. Naturally I have seen that you are not happy, though there have been moments when you were the very personification of light-heartedness, and I have known for a long time that the motif of your whole nature is resentment. Believe me, Miss Durwent, if I could be a friend—and I mean that to the last ditch—I should be deeply grateful for the privilege.'

'Thanks,' she said simply, and placing her hand in his, let it remain there.

The hot blood of his impressionable nature mounted to his cheeks, and his heart was aflame with a sudden intoxication of desire. But chivalry told him how much it had cost this girl, whose whole being rebelled at the thought of being physically conquered, to show such a mark of confidence. And reason warned him that any triumph he might obtain would be only for the moment. He watched the flight of a hawk in the sky—and his lips were parched and hot.

'For a long time,' she said, 'I have had a growing sensation of suffocation in life. It's stifling me. When I look ahead and see nothing but this kind of life—visiting, visiting, entertaining, entertaining, listening to that endless talk in London—well, I think I understand why some women go to the devil. At least there's something genuine about sin.'

A rabbit leaped from a bush opposite as though it had seen something terrifying, and scampered madly across the field to some burrowed refuge by a great oak. Selwyn felt the hand in his tighten convulsively.

'Look!' she cried. 'Austin—look!'

Her face blanched with sudden alarm. He sprang to his feet.

'What is it?' he cried.

'The bush—there—where the rabbit darted out.'

He looked at the spot indicated by her trembling hand, but the dwindling sunlight had just passed it, and he could see nothing but a clump of shrubbery.

'It was a man,' she said, her voice shaking querulously. 'I saw his face. He was crouching there and watching us.'

Selwyn frowned. 'Some poacher fellow,' he said, 'that's all. At any rate, I'll make sure.'

He started for the bush, when, with a tearful laugh, she stopped him, her hands clinging to his arm.

'No—no,' she said swiftly, 'it's nothing. It was just my nerves. There is no one there. The rabbit startled me.'

He hesitated momentarily, then, turning to her, gripped her arms with his hands. A great feeling of pity for the high-strung girl welled up in him, and he wished that it were possible to impart some of his own strength to her. 'Elise,' he began hoarsely, his whole being in a cloud of passion through which his brain slashed its lightning shafts of warning—'Elise.' . . .

The hall gong, growing in a clamant intensity rang out on the quiet air. With the lightness of a fawn she released herself from his grip, and gathering her skirts in her hand, moved towards the path. 'Come along,' she cried; 'we shall be late for dinner.'

He followed her slowly, his hands in his

pockets and his mind besieged with countless thoughts. As he crossed the lawn he looked up.

From a window in the tower of Roselawn there was shining an angry, blood-red reflection of the sun's dying moments.

VI.

It was a few minutes after midnight when the party at Roselawn retired to their rooms. There had been an impromptu dance, following some spirited bridge, and there was more than the usual chaffing and laughter as the guests dispersed to the various wings of the house.

Tired with the many events of the day, the American quickly undressed, and soothed by the comfort of cool sheets, lay in that relaxation of mind and body which prefaces the panacea of sleep. With half-closed eyes and drowsy semi-consciousness he heard the sounds of life growing less and less in the roomy passages of Roselawn, as his mind lingered over the burning memory of Elise's proximity a few hours before. He felt again the perfume of her hair and the radiant freshness of her womanhood, with its inexplicable sense of spring-time. And memory, with its power of exquisite torture, recalled to his mind the questioning eyes and the trembling, beckoning lips.

The soft chime of a clock downstairs sounded the passing of another hour. Its murmuring echo died to a silence unbroken by any sound save that of the summer breeze playing about the eaves and towers of the house.

Minutes passed. His thoughts blurred into the gathering shadows of sleep.

Of a sudden he was awake, his eyes staring into the dark, his whole body nervously, acutely, on the alert. He had heard a cry—of a night-jar—but so strange and eerie that it made him hold his breath.

The call was repeated. An owl answered with a creepy cry of alarm. Selwyn muttered impatiently at the trick played upon him by his nerves, and turning over, was about to settle again to slumber, when he heard a door softly opening. Light footsteps passed in the hall, stopping at each creaking board as though suspicious that some one might hear; then their sound was lost in the thick carpet of the stairway.

For a minute there was complete silence. He heard from below the cautious opening of the side-door leading to the lawn.

Wondering what mischief was on foot, he rose from his bed, and peering through the window, tried to penetrate the gloom. A sullen sky kept the stars imprisoned behind deep banks of clouds, and only the trees, by reason of their solid blackness, were discernible in the darkness of the night. Slipping on a dressing-gown, he stealthily left his room, and creeping downstairs, found the open door. Emerging on the lawn, he looked quickly about.

Beneath a near-by tree he saw a woman in

white, and the figure of a man pleading for something. Suddenly Selwyn saw the woman take some article from around her neck and hand it to the man. The fellow took it, and seemed to be turning away, when, with a suppressed sob, she caught him in her arms, murmuring incoherent endearments through her tears.

The black scudding clouds left the sky clear for a moment overhead—and Selwyn felt a contraction of pain in his heart.

The woman was Elise, and the man—her brother Dick.

CHAPTER X.—GATHERING SHADOWS.

I.

BREAKFAST at Roselawn was a studiously inconsequential meal. Places were set as usual by the servants, but the viands and the paraphernalia necessary for their preparation were placed on a separate table in the alcove by the great window overlooking the lawn. Having performed this duty, the servants did nothing more; but one could not help feeling that they were just outside the door, like a group of prompters, ready to render instantaneous assistance should the amateurs falter.

Lord Durwent made a kindly and efficient supervisor of the commissariat table, and—there was no question of it—could boil an egg with any one in the county. And the guests plying between the source of supply and the breakfast-table proper created a vagabondish camping-out air of geniality that did much to dispel the natural stiffness of the morning intercourse. As the meal had no formal opening, every one arrived at any time during the breakfast period, and though constant apologies were offered for the frequent interruptions to Lord Durwent's own meal, it could be seen that his enjoyment of buffet proprietorship was almost a professional one.

Lady Durwent's part in the function was to supervise the coffee, and ask each guest how he or she had slept, expressing regret that the night had not been cooler, warmer, calmer, or fresher, according to the polite customs of social dialogue at breakfast.

At nine-fifteen the papers used to arrive from the village, always causing a flutter of excitement. The sense of solitude at Roselawn made the outside world something so remote and apart that there was genuine curiosity to discover what the deuce it had been doing with itself during the house-party's retreat.

Lord Durwent read the *Morning Post* as a sort of 'prairie oyster' or 'bromo-seltzer.' It settled him. There was something about that journal's editorial page and its dignified treatment of events that made Roselawn seem the embodiment of British principle. Being a man who prided himself on a catholicity of viewpoint, he also subscribed to the *Daily Mail*—

that frivolous young thing that has as many editions as a *débutante* frocks, and by its super-delicate apparatus at Carmelite House can detect a popular clamour before it is louder than a kitten's miaow.

As a concession to the ladies of the household, he took, in addition, the *Daily Sketch* and the *Daily Mirror*, those two energetic illustrated papers, which, benefiting from the remarkable geographical fact that every place of consequence in England is exactly two hours from London, are able to offer photos of riders in Rotten Row,

bathers at Brighton, boat-races at Oxford, and foreign monarchs walking at Windsor, the very morning after all these remarkable persons have astonished the world by riding, bathing, racing, and walking.

But to Lord Durwent these papers and the *Daily Mail* were but interludes. The *Morning Post* was the real business of life, and after reading through its solid columns of type, he enjoyed the sensation of somehow having done something for his country.

(Continued on page 196.)

THE HUB OF FILMLAND.

By P. R. GORDON.

SOUTHERN CALIFORNIA is famous, amongst other things, for its matchless climate, and as being the hub of the moving-picture world. Turquoise skies, perennial flowers, and soft balmy air act as a magnet, drawing thousands of people annually to this land of enchantment and romance.

When cinematograph production was in its infancy, alert far-seeing men saw in this smiling land, and the priceless quality of the sunlight, tremendous possibilities for the development of picture-play photography to its highest degree. Miniature cities, devoted entirely to the production of moving-pictures, sprang up like mushrooms within a few years; now the studios and other buildings have increased to such an extent that many acres of ground are required to hold them. Thousands of persons of both sexes are employed throughout the year by the powerful film-companies whose headquarters are in and around the city of Los Angeles. At the present time the cinematograph industry is one of the most important of all the industries of Southern California.

A decided novelty a few years ago, it is now quite a common sight to see groups of picture-players, attired in all kinds of strange costumes, engaged at various points in the production of moving-pictures.

It was the custom, not long ago, for picture-players—motor-car loads of them—to set out in search of the most suitable locality for the production of the particular scene to be enacted; and frequently the greater part of a day would be spent in this tiresome, expensive, but very necessary business before the desired setting had been discovered. By this time most of the players would be tired, hot, and bad-tempered, and in some cases would decline to act until it suited them, with the result that one would see the unedifying spectacle of the director of the production pacing up and down a barren stretch of parched alkali land, tearing his hair and raving like a madman at the delay.

Now it is different; everything is run on a

thoroughly organised system. All the leading picture-companies have on their staff men—technically known as 'location scouts'—whose duty it is to scour the country in search of locations. So efficiently have these men done their work that it is now somewhat difficult to find new locations, as there is scarcely a nook or corner in the whole western country, stretching from the Rocky Mountains to the Pacific coast, that has not been looked over (photographed in many cases) and properly classified by these scouts. All the data in connection with the different locations are recorded in the location-office of each company, and are available for immediate reference at any time. The location-office is constantly in touch with the various scouts stationed at all the principal locations. Once it is decided to film a photodrama in one of the distant locations, a telegram is despatched from the office to the representative of the company at that point. By return comes a telegraphed statement regarding the climatic conditions; whether or not the location is available; whether any changes have been made in it; together with complete information concerning transportation and the cost of using such a location.

So varied is the scenery of the country surrounding Los Angeles that a most suitable location for almost any kind of play it is proposed to film can be found within a few hours of the city. Rocky Mountains, Canadian woods, Sahara deserts, Tyrolean Alps—all can be had at a small rental per day.

In this connection a good story is told of a producer, very much in the public eye at present, who required a suitable location for the purpose of filming a cattle round-up—in other words, a 'cow-country.' He sent one of his scouts to Montana to find the necessary location. In a few days the scout telegraphed: 'No typical cow-country here. Better cow-country near Los Angeles.' The picture was, therefore, made at a big ranch owned by a prominent film-company, a few miles from the city.

It was at the same ranch that many of the most terrible battles in picturedom were fought and filmed.

Los Angeles itself is the scene of many well-known and popular photo-plays. Producers find it difficult at times to enact scenes in the streets of the city, especially at midday, as crowds gather round the players and endeavour to get a place in the scene being photographed.

As a rule locations are easily secured in and about the city, as many of the wealthy residents are only too willing to allow the picture-makers the use of their beautiful homes and grounds at a nominal fee. Directors and players alike exercise every care over any property they may be temporarily using. This is not always the case, however, as the following story shows. A beautiful mansion, situated in one of the most select parts of the city, had been leased to a picture-company for a trifling sum. The owner, on his return, was exceedingly annoyed to find a dirty gang of ragamuffins—employed as 'extras'—lounging all over the well-kept lawn and the spotless porches, eating sandwiches and fruit-pies, and throwing scraps of food in all directions. Even the front-door had not escaped their attention, as the remains of a pie, smashed to smithereens, showed. In another case—a magnificent country estate this time—the director of the film-company had caused a grave to be dug on the front-lawn. These are exceptional cases, however.

Some of the smaller towns in Southern California are used regularly by the film-companies for special kinds of pictures, as these towns are recognised as being typical of certain sections of the country. The natives of these places look forward to the coming of the players; their visit usually means a little diversion and a good many dollars.

A story is current of one of these towns to the effect that the officials there actually refuse to do any repairs in the way of rebuilding the wooden side-walks, straightening the fences, or even painting the houses, because they fear the place will be ruined for picture purposes, with consequent financial loss to themselves.

Another story in illustration of the effect picture-making has on the natives of some of these small towns is told by a well-known player. The buildings in this particular place were all painted white—a colour that was much too bright for the purpose of the producer. By spending a few dollars judiciously, permission was obtained to transform the glaring white of the buildings into rainbow colours, by the use of water-colour paints. When the men of the village returned at the close of the day from their employment farther afield, they were astonished to find the change that had taken

place in their homes. Their astonishment, however, was nothing compared with their bewilderment when they returned the next day and found their buildings a spotless white again, the colours having been washed off during their absence.

As is well known, all types and races of people are employed on various occasions in the making of different kinds of pictures, and in this connection the following story is told of a prominent producer who used some Chinese in one of the scenes of a certain picture. The incident occurred before a store in a street in Singapore. One of the Chinese suddenly pointed to a sign, hanging over a doorway, which announced in Chinese the entrance to a tea-garden, and shouted in tones of great excitement and in very indifferent English, 'Bad—velly bad.' The Chinese interpreter attached to the company had been sent into the city on an errand, and the producer, after many vain and futile attempts to discover what was wrong with the sign, decided to have it painted afresh, and sent for a sign-painter, meantime keeping the entire company waiting for the interpreter to return. That imperturbable gentleman arrived after an hour or so, looked at the sign, and smiling his inscrutable smile, curtly remarked, 'Have it turned over; it is upside-down.'

Another story of the same producer would seem to indicate that it is not always necessary to work in order to earn money. The producer had been hunting for a location in a park, and had discovered quite a good one, but found a couple of ne'er-do-wells leaning against a tree. They were asked to go away, but refused. Finally the producer had to pay them five dollars each to move on.

The ingenuity of some producers in overcoming difficulties in making certain pictures is shown in the following account of a rainstorm that was made to order. By authority of the police and the fire department officials, one of the residential streets in Los Angeles was recently closed all night to allow a picture-company to film a scene in which the heroine, riding a motor-cycle, was pursued through a rainstorm by a racing car in which were the villains of the play. The street, to a distance of one-fifth of a mile, was roped off and patrolled by police. Hundreds of spectators lined the street during the first hours of the 'storm,' but dispersed before morning. To illuminate the street for photographic purposes thirty arc-lights were mounted on fifteen-foot platforms; two 140-ampere spot-lights and an apparatus known as 'lightning scissors' were also used. 'Rain' was supplied direct from the water-mains, and so great was the water-pressure at the hoses that six men were required on each of the four nozzles.

A GOOD WORD FOR MACBETH.

By JOHN FOSTER, M.A., Author of *A Shakespeare Word-Book*, &c.

IT has been remarked that in a literary court of libel many historical characters in fiction and the drama might conceivably bring competent actions against their creators for having unjustifiably held them up to public odium and contempt, or wrongfully represented them as the incarnation of malignity and cruelty. Macbeth, whatever blame he might attach to the early chroniclers, would, in all likelihood, issue a writ of summons against the great Elizabethan dramatist to whom the world owes its conception of the character of this Scottish monarch. And, in the end, the finding of the court would doubtless be that the protagonist of the play had made out a good case against its author for having weighted him with an unwarrantable and irreparable wrong.

In comparing Shakespeare's work with Scottish records, critical investigators have discovered that there is great divergence from ascertained historical fact. They have also shown that the story on which the framework of the play is based agrees in very few particulars with the reality, and that the character of Macbeth is of a very different complexion from that under which it is usually represented. It is impossible, therefore, to get anything like a faithful portrait of him from the dramatist, whose main purpose seems to have been to capture an audience by holding the king up to reproach in a series of intensely thrilling scenes.

The material for this play, as for others connected with the histories of England and of Scotland, was drawn from the *Chronicle* of Holinshed, who was indebted for his account to the twelfth book of the *Scotorum Historiæ* of Hector Boece, the first Principal of King's College, Aberdeen; and he, in turn, followed Fordun, canon of Aberdeen, and author of the first five books of the *Scotichronicon*. Holinshed's story is supposed to be largely mythical; and when to the unreliability of the narrative on which the play is based there is added the fact that the dramatist makes frequent deviations and excursions even from his authority, the historical value of the tragedy becomes still more negligible. These Churchmen of the Middle Ages were idealists, and described things as they thought they should have been rather than as they were. With an easy habit of mind they seized upon traits different from those of the times they knew, and these they regarded with disfavour and aversion. The chroniclers' minds being thus emancipated from the petty perplexities associated with strict and accurate inquiry, legends necessarily loom large in their records. Their narratives are what Charles Lamb would call 'shadows of fact'—verisimilitudes, not verities.

The consequence is that, by tampering with historical events, these annalists have held up to obloquy the name of a sovereign possessed of many kingly attributes which they ignore.

It is now accepted that Macbeth did not violate the sacred laws of hospitality by murdering Duncan in his own castle of Inverness; nor did he aggravate the crime by committing it in the threefold relationship of kinsman, subject, and host. Even the existence of a castle with the architectural features and amenities suggested by the play is put by the dramatist at a wrong chronological period. If Macbeth possessed an abode of any kind in Inverness, archæology refuses to concede to it the accessories of a princely feudal structure. The times would rather require it to have been of the nature of a 'rath,' a primitive set of buildings constructed of wattle-and-daub, and fortified by a circular rampart of earthworks. But, as a matter of fact, the scene of the murder was not in a castle at Inverness at all. The outrage was committed at Bothgowan (Gaelic for a *smith's bothy*), a place near Elgin in the territory of Moray, over which, in virtue of his marriage, Macbeth as steward exercised the office of royal deputy. It is supposed that advantage was taken of the presence of Duncan in this neighbourhood, when on his way northward to suppress one of the numerous revolts that were features of a reign of great incompetence.

The mystery as to whether Macbeth was the principal actor in the murder, or merely accessory to it, is never likely to be resolved, and in this matter we are left upon an uncharted sea of doubt and guesswork. Both he and his wife had motives for the crime. In those far-away times the law of royal succession was as yet irregular and unsettled. The successor was often a powerful collateral relative who became king through the operation of the ancient law of Tanistry, according to which the right was hereditary in the family, but elective in the individual. The purpose of this arrangement seems to have been to convey the right to rule to the strongest in the family and the most worthy of the blood. In short, subject to these limits, it came to this, that *he was king who could*. Macbeth was possessed of many endowments and qualifications for the office. He was of the royal house, and, like the king, was grandson of Malcolm II., whom Duncan succeeded. He seems to have been a forceful and attractive personality. Even in the play Macbeth is the embodiment of chivalry—his manner is frank and engaging; his courage is exceptional; he is kindly and warm-hearted; his bearing commands

respect; his repute is in every one's mouth. Such a strong character must have won remarkable ascendancy over the people, and romance would soon gather round his name.

On the other hand, Duncan appears to have been lacking in those qualities necessary for the proper discharge of the duties of his office. Whatever may have been the cause of the numerous revolts against his authority, he was evidently without the firmness and resolution to suppress them. Swayed by no lofty dominating control, he failed to exercise rigorous authority over a turbulent people, whom a strong ruler should have been able to keep well in hand. Besides, his life seems to have been directed by no sovereign principles. He is characterised by Andro of Wyntoun, the most reliable of the early chroniclers, as a vicious, blood-thirsty, selfish tyrant, who satisfied his lust by the most unscrupulous methods. Under such conditions and in such times, with other political susceptibilities involved, it can well be imagined that Duncan's occupancy of the throne would be held on a very precarious tenure. It was, therefore, in the ordinary course of things for a man with the characteristics of Macbeth to dream fancies which would transport him 'beyond this ignorant present,' and it would have been no irregularity or matter for surprise if Duncan had named him as his successor, especially as the king's sons, owing to their youth, were not fit to rule. One can then conceive the keen disappointment of Macbeth at seeing the airy castle of his dreams topple down, when he learned that Malcolm, an illegitimate son of the king, was named Prince of Cumberland, a title which carried with it the promise of succession. And there is little cause for wonder if forthwith he cherished thoughts of attaining the object of his desire by the use of the foul methods of the period, when fair ones were seen to be likely to fail.

Lady Macbeth's wrongs were far more impelling than any of the prettexts of her husband. They might well be reckoned to fill her 'from the crown to the toe topfull of direst cruelty,' and to render her unsparing in her vengeance. If the theory holds good that two collateral branches of the royal house took rule by turn, then Duncan, grandson and immediate successor of Malcolm II., might rightly be considered a usurper; and, with the succession open to the female side, Gruach, wife of Macbeth, would naturally feel that she had full warrant for taking the ordinary measures of those rude times to establish her claim as the real heiress. From a later incident it would appear that Gruach actually did claim to be queen in her own right, for, after Macbeth's death, the contest for the crown with Duncan's family was continued in favour of Lulach, son of Lady Macbeth by a former husband. But, besides, she had several other indignities to give her cause for revenge.

Her grandfather, Kenneth IV., was killed by Duncan's predecessor, who is said to have also murdered a brother of Lady Macbeth to remove him from the succession. The incident, however, that would most contribute to whet her spirit of resentment would be the burning of her first husband, the maormor of Moray, with fifty of his followers in his own castle. These circumstances and the habits of the period being considered, it may be possible in some measure to palliate the execution of such a dire revenge as followed, and to modify considerably the popular notion with respect to one who has been represented as the most ruthless and implacable of women.

With the scene of the murders definitely shifted from the imaginary buttressed castle of Inverness to the humble smith's bothy, one is spared the necessity of accepting as true the account of the murder of the grooms in the king's sleeping-apartment. The facilities for a royal retinue to exercise all its customary functions would, in the circumstances, be of the most inadequate nature. It is probable that the episode is entirely fictitious, and is based upon a historical incident to which Shakespeare imparted the vital glow by means of that marvellous power which he possessed of seizing upon any particular occurrence and adapting it to his own immediate purposes. There is sufficient likeness between the incident as depicted in the play and the murder of the Earl of Gowrie and the Master of Ruthven in what is known in Scottish history as the Gowrie Conspiracy, to warrant the conclusion that the keen-eyed instinct of the dramatist made most of this incident to give his play an added tragic tone. The report of the conspiracy was well known in London in 1600, and it must doubtless have fallen into the hands of the poet, ever on the outlook to appropriate such stirring episodes for stage purposes.

It was a pretty conception on the part of Shakespeare, and one fitted to strike the imagination, to attribute to Banquo the source from which the royal house of Stewart was to trace its proud descent. The pregnant announcement of the witch to Banquo in the play, 'Thou shalt get kings though thou be none,' was calculated to suggest to Macbeth, as he mused on the future, subsequent dynastic troubles for himself. He foresaw in its fulfilment an unlucky turn to the future politics of the Court, and 'horrible imaginings,' dallying with ambitious thoughts, at once pointed to the means for preventing its accomplishment. But the whole of this fanciful idea savours pre-eminently of the witches' cauldron. Of the murder of Banquo by Macbeth's instructions and the frustrated assassination of Fleance there is no historical record, and authorities decline even to recognise persons with whom these characters can be identified. Their very names are mythical. Holinshed

alone among the chroniclers entertained the idea that the home of Banquo lay in Lochaber, over which province he is supposed to have ruled as deputy for the king. But this theory is a mere invention, and may at once be dismissed from consideration, inasmuch as the inaccessible fastnesses of the Western Highlands were not yet included within the domains of Scotland's king. For that reason there could be no thane of Lochaber for whom was reserved an honoured place among Scotland's nobility at the royal banquet.

What in the play, perhaps, most makes the minds of men reel with horror is the motiveless cruelty shown in the massacre of Macduff's family. Can any palliation be offered to gloss over this infamous butchery? Various reasons are given for the existence of an embittered feeling between the king and Macduff. It is recorded by Wyntoun that Macbeth's displeasure was incurred during the building of a royal castle on Dunsinane among the Sidlaw Hills. In this undertaking the thane of each shire was expected to assist in turn, and when the time came in course for Macduff to do his bit, one account avers that he sent all needful provision of men and animals, but declined to countenance the operations personally, as the other thanes had done. According to another report, the oxen sent by the thane were in such poor condition that they failed to haul the loads of timber. Whatever may have been the delinquency, Macbeth was discerning enough to rate at its proper value any evidence of courtly shabbiness or indifference. In the height of passion he therefore made Macduff the object of his fury, and was heard to threaten that he would yet ride the thane with a snaffle. This menace did not fail to reach the ears of Macduff, who forthwith resolved to take what seemed the most prudent course of the time, and made a hasty flight to England. His intention, however, was not unknown to the king. Even in those days it was not easy to defeat the vigilance of the intelligence service. In the domestic policy of the period a turn for espionage seems not to have been an unknown feature, for we read that the king 'had in every noble mans house ane slie fellow or other to reveale all that was sayd or done within the same.' To intercept Macduff's flight, Macbeth hastened to the thane's castle in the south of Fife. But his pursuit was useless. The quarry had escaped; and Lady Macduff, in the course of an interview with the king, cunningly contrived many excuses and delays until she saw her husband's boat well out of reach on the Firth. By this manœuvre Macduff escaped, to the bitter chagrin of his pursuers, no doubt. But there is again no historical evidence that an appallingly ruthless vengeance was practised upon his family. With insufficient information an open mind

must also be kept on this episode. If one may give wings to fancy, however, and hazard a conjecture based on positive knowledge, it might be concluded that Macbeth would not glut his fury against a defenceless household to the extent represented. Circumstances would rather suggest a conclusion dead against this view. As head of the Clan Macduff, the thane of Fife had given Macbeth very material aid at the time of his accession, and, in return, there were conferred upon Macduff's house certain distinctions and privileges which are known to have been continued into several of the following reigns. These included the command of the van of the royal army, and the right to place the king in his chair at his coronation. It is not difficult to imagine that this cause of friendship would be potent enough to moderate, at least, any feelings of drastic resentment. And it is unreasonable to think that, in all the circumstances, a family hitherto so greatly favoured, and known to be soon again in high repute, could be the object of such a reckless revenge.

Before the play closes, a perfect orgy of ruthlessness, assigned to Macbeth's brutal activities, is conjured up in the mind, when 'each new morn new widows howl, new orphans cry, new sorrows strike heaven on the face.' It is a period of storm and terror. Nothing on earth can more resemble the powers of evil let loose than this vision of the wreck of homes and the ruin of families, with their waste, their woe, their heart-throbs, and their tears. Everywhere, one would expect, would be traced the trail of brutality which everywhere would lead to the spectre of desolation. In ordinary circumstances such enormities must have proved disastrous to any economic development, agricultural or commercial, the country was capable of showing at the time. Yet there are no signs of this. The reign was no failure. Macbeth exercised sway over domains wider than those administered by any former Scottish sovereign, and hitherto Scotland had enjoyed no more plenteous and prosperous times than those of the reign of this powerful personality. Wyntoun remarks:

All his tyme was gret plente
Habundande bathe on lande and se.
He was in justice richt lauchful,
And til his legis al awfulle.

Macbeth, it may be allowed, was no Nathaniel either in precept or in practice, and his several vices, the exact complexion of which is not revealed, would in all likelihood be traced in some of his executive measures. But history is once more silent with respect to this dreadful tale of woe.

Nothing, perhaps, in Macbeth's life became him like the leaving it. He is great even in death, and dies a warrior in the flush of battle. Macduff, when he fled to the English Court,

joined there the exiled sons of Duncan, to whom he submitted a scheme for the overthrow of the king. Malcolm, a bastard, harbouring designs to step over his own elder brother, had no hesitation in listening to the proposal. Supported by Siward, Earl of Northumberland, with strong forces, they invaded Scotland, where it was evident there was now no lack of inflammable material, and overcame the king at Dunsinane. But this was not the end, although the dramatist, following, it may be, the tradition of the neighbourhood, represents the death of the king as an incident in this encounter. The battle was inconclusive. Macbeth, retreating northward to Deeside, made his last stand two years later at Lumphanan, in Aberdeenshire, and on Perkill his enemies bore him down and killed him. A cairn, still pointed out as Macbeth's Stone, marks the spot where his body is supposed to have been buried. Wyntoun's *Chronicle* gives an account of the tragic end, and tells how—

Our the Mounth thai chased hym than
Til the wode of Lwnfannan,

Thus Makbeth slew thai than
In to the wode of Lunfannan.

It may be of little value to attempt to conciliate hostile prejudice raised against Macbeth by the wild legends so skilfully woven into the drama, and those dusty times are so remote that a passive public may be apathetically disposed to leave undisturbed the gravestone of a buried past. In the interest of fair-play, however, if not of historical truth, one has no right to let the dead hand of a long-standing injustice interfere with the plain duty of removing, so far as possible, any infamy that has been hitherto wrongly attached to the king's name. The whole subject is obscure, and it is unreasonable to assume a pontifical attitude either way. But, from the reports of those who lived nearest to his time, Macbeth appears to have employed his executive powers in a resolute but even-handed manner. He was a man of passionate patriotism, and gave of his best to the service and the material well-being of his country, his main object being to usher in and encourage a spirit of reaction against English influence, which had repeatedly obtruded itself in affairs of State.

It may be mentioned, whatever the value for the present purpose, that Macbeth was the first king noticed in ecclesiastical records as recognising the activities of the Church, and as assisting its operations by means of considerable benefactions. Too much need not be made of this. It was a medieval practice, encouraged by many monks, to represent a gift to the Church as an instrument for gaining remission of punishment for terrible wrong-doing, as well as for securing an entrance to eternal felicity. And there has been in all ages a calculating type of person, with a strain of piety and policy, who, when he

observes that godliness is profitable in all things, straightway proceeds to do what he thinks is a religious act as a salve to a jaded and troubled conscience. In whatever way Macbeth was actuated to win distinction for early liberality to religious enterprise, whether by the lofty motives of the pious donor or by the mean impulses of the pietistic worldling, it is safe to say that, in the latter event, his action was not prompted by a sense of remorse for anything but a fraction of the sum of blood-stained cruelty attributed to him in the play.

Granted that the misrepresentations contain even a small measure of truth, on the whole the king emerges from the somewhat tangled and fragmentary history as a ruler, if not any better, at least no worse in talents and character, than most of the potentates of those misty times. But 'how his audit stands who knows save Heaven?' In all probability his case will never come to maturity in process of time; for Time is not always the Father of Truth, notwithstanding the familiar saying of Rabelais. There may, therefore, never be any final verdict by the world. Let his memory, then, be lightly handled, and let him, without prejudice, have the benefit of any reasonable doubts to which he is rightly entitled.

SEPARATION.

My heart cries South, and your heart North,
Across the weary miles between;
But ere we meet, the rowans green
In scarlet pomp will blazon forth;

The beech-woods round your lonely stead
Will sigh while some October gale
Bestrews dear Avon's gentle vale
With half their mellow bronze and red;

The faded green of sun-tired downs
Will shimmer with November dew;
Or blackened dahlias counsel you
To lavender your summer gowns.

Ah, could we find a further sense,
Above the five of commonplace,
Immune to laws of time and space,
Our souls to knit in conference;

That we might each, in exile, feel
An interchange of life and thought,
A reciprocity in aught
Of moment to our common weal.

Fond hope this world may scarce fulfil!
Then let us thank what powers there be
That somewhere waits for you and me
Our own warm hearth below the hill.

These gray, sad months that laggard move
Are but the price that life demands;
And, lo! beyond its quittance, stands
The vision splendid of our love

A. T. CORKE.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

WHAT may be needed to stir again the jaded emotions of mankind to a degree of interest and excitement will be afforded during this year by the aeroplane. Those who glance upon daily newspapers and perceive how persistent and remarkable is the development in flying-machines and the human handling of them, how a little is added to the effort and the progress continually, how scarcely a day is allowed to pass without the record of a new forward step, and how these notes and articles all bear upon discovery and intention with a force of mind and a good enthusiasm to support them, can have little doubt that a subject now so dominating will dazzle the human fancy again, strike a shock upon the senses when no other performance of man at present within the scope of our imaginations could do so much. Another world war, more terrible than the one we have endured, could scarcely move the mind of the present generation to any other emotion than one of sickness. War may be an instinct of the human race, but, on balance, progress is a stronger one; were it not so there would speedily be an end of things. Inventions and discoveries in the mechanical and scientific way may please us by the advantages and the conveniences that they afford, but they are as the continuation of an old story which was being told even before our own individual times. These things are excellent; they are needed, demanded, but they are as matters of course. The average man, he of the street, pays little heed to them. Yet he never fails to turn his gaze aloft when he hears the now familiar droning in the air. He is not astonished that by the telephone he in London can hear a voice in Paris; he does but complain that the telephone service possesses not the perfection he thinks it should. He might with disdain reject the offer of a passage upon an ocean steamship on discovering that it was not equipped with a wireless-telegraph service by which the old abysmal solitude of a human mite upon vast waters, tossed amid tempests on tearing seas hundreds of leagues from land, was ended. Now such mite may communicate at ease with other mites in different oceans, and with persons on receding and nearing continents. No longer does he marvel. The opening romance

of radium that may lead to a transformation of the world and of life does not stir him. It seems to him that he has heard something of this kind of thing before. He accepts the principle that the crude matter he sees about him no longer constitutes or suggests that measure of finality which had been attributed to it through all the ages until not long ago. He realises that only a beginning is now being made by an imperfectly but sufficiently developed human investigating instrument upon the limitless labour of scientific discovery, and that at the heart of the universe there must be millions of wonders now beyond his grasp as beyond his comprehension. So far we have but chipped a few granite splinters from the guarded entrance to this hall of nature's mystery; the piles of gems are beyond the view within. In far-on ages they will be discovered. The manner, the quality, the appearance of life will have become much changed by then. Men and women will surely not be the same as now; they will differ in thoughts and looks. The discoveries will have caused a change, have led on rapidly to a new development of the species. This is merely a matter of common progress as we know it. From the time of the application of steam and electricity to our human purposes, the spirit of progress has seemed to overcome finally the initial resistance by nature to human curiosity which had been but indifferently exerted. Thenceforward progress gained in momentum every hour. So new discoveries are mostly taken by people almost spoiled with gifts (applying them now-days to the most evil purposes) as all in the day's reward for the simple exertion of existence.

* * *

But human beings do not become accustomed to the aeroplane and its achievements in flight; there is something about it, apart from the progress it accomplishes almost every day, that fixes an instinct in them that this mechanical bird, on whose back they may soar the air above the eagles, marks the utmost change in the habits and the possibilities of man, sets quite a new era before him in which all life may be transformed, every occupation, habit, arrangement be affected. The human person from his first evolution has been a crawler on the earth; with certain difficulties and hesitations he has

accompanied the fish in the sea, a hampering and restricted medium for movement, but one which circumstances make necessary for employment. The sea and the land are as of the earth with all its limitations; but the air, although it also belongs to the world, is of a different consideration. Even though man alive must cling to earth, yet to fly above it, pierce the clouds, flash through the skies to distant lands in the shortest space of time and in the most agreeable manner, gain that extraordinary sense of emancipation that comes from such flight, is a change in the scheme of existence, something newer and greater than anything we have known. There is the proof of that in this refusal of the mind or instinct to become accustomed, as we say, to the aeroplane in flight. Many years have passed since once, late on a spring afternoon, standing on the railway platform at Monte Carlo in the depths below the casino, I heard a strange humming in the air, and, looking up, perceived for the first time an aeroplane in flight. They were very new at that time, yet, nearly miraculous as they seemed, they were hardly more wonderful then than now. One had then the sense of the crashing of a new epoch into time and the beginning of a revolution in the way of human life. Seasons have passed, war has been fought in the air, romance of battle conflict has been enlivened by more extraordinary pages than ever it embraced before, the aeroplane in peace adds and gathers new distinctions daily, and yet it is as wonderful as ever, and not less impressive. Even those who themselves have flown afar, and have witnessed aeroplanes making their history in various lands and in strange circumstances, when in latter days in the heart of London they hear the hum of planing somewhere in the air outside, suspend their task and open the window wide for yet another glance at this most wondrous thing. It compels attention most insistently; there is an instinct in us for this homage which indicates its transcendency. In the old war-time we would hear the aeroplanes overhead, though we did not see them, on nights of expected raids, humming in swarms until their witches' music swelled like the diapason in full organ flood. Who that heard it will ever forget that weird music?

* * *

Having conquered a new world, or something rather bigger than a world, it should perhaps, after all, not be a matter of wonderment that the human creature with his new engine should achieve something more that is new and, in a manner, still more wonderful almost every day. He and his flying instrument leap at every opportunity with a sparkling imagination. They dazzle with their resource. The men of the railways, in their bad mood, forsake the trains, and the nation is in a predicament. But for the affairs of journeys and transportation which

matter most there is the aeroplane again. In greatest urgency it carried men and women, newspapers and things, long aerial distances, and it bore hundreds of letters a day from London to the provinces. Let the railway and those who are concerned take note that, while in non-striking days we must post our letter, in one of the scarlet boxes in London, by five or half-past in the afternoon if we would have it delivered up in the north on the following morning, such a delivery could be gained by aeroplane even though we enjoyed another night's repose before writing the epistle. During the railway strike of last October the aeroplane made a magnificent justification of itself as a cardinal instrument of peace. About the same time there was a strange coincidence. Never was travelling through the streets of London and out towards the suburbs a more difficult matter than in these days. Congestion and confusion, crush and discomfort, with disappointment often—it is harder for the people in general to move about with comfort and convenience than ever it was in London before. Systems of transportation have broken down, and the minds of controllers appear to have boggled at the crisis. So one day the executive committee of the London Labour Party issued a protest against the proposals of the Select Committee on London Traffic, and on that very day of all days, being the first on which civilian flying to France was permitted, an aeroplane crossed from London to Paris in the morning, and came back to town in the afternoon, punctually to its scheduled time. Since then there has been the regular and uninterrupted service. Day by day the planes have flown in each direction; they have kept their times, on the whole, perhaps a little better than the railways. Now and then they are here or there before the minute that was appointed. Gales do not matter; they fly serenely on all occasions, and take their passengers and parcels in safety. So to Paris, so to Brussels, and so to other places. We may go to Paris and back in less than six hours. It is not only that in such a matter we may beat the railway and steamboat system by a day or so, and thus add a day and the conservation of some energy to life, but that it is proved in experience that thus our air post defeats even the telegraph-wires themselves! And it is a passage of ease. When speeding through the air at a hundred miles or more in the hour from England to the Continent one may recline in comfort in an easy-chair, read a novel, take luncheon, do a little work with a pen, or sleep a while. There are strong emotions for the novice, but for those of a little experience it is a simple thing. It does not appear that in our time, at all events, there will be any end to these advances. Years ago, when flight was young, I remember Captain Robert Scott, who reached the South Pole by the crawling way along ice and snow, discussed with me, on the

ave of his last journey, the future possibilities of getting to the Pole by aeroplane. He had been nearly tempted to a trial; but then the machines were too little tried and too unreliable, and, again, he had the traditions of explorers in his soul, and wished to reach the Pole in something of the old way and with a conquest of all the historic difficulties. Yet he almost took an air-machine with him.

* * *

But now, come June, and what Scott just faintly fancied is to be attempted. The British Imperial Antarctic Expedition which, under the leadership of Mr John L. Cope, is to make a start this summer will endeavour by the use of the aeroplane to accomplish by a flight of twenty or twenty-five hours what otherwise might involve a tortuous journey lasting many months. Leaving England in June, Mr Cope and his men intend to sail for Wellington, in New Zealand, and then proceed to Macquarie Island, where a geological survey is to be made. Then they proceed to Scott Island and establish wireless and meteorological stations there, and next move on to New Harbour, where headquarters will be fixed. Thus, says the leader, with his boat and his aeroplane carrying wireless equipment and these stations established, they will be in wireless touch with civilisation wherever they may go. In London, indeed, we may perhaps exchange a message with our man at the very Pole itself. Here is a concentration of achievement for the mind to play with! 'The distance of the Pole from the base from which the aeroplane will start,' says Mr Cope, 'is about seven hundred and fifty miles. We shall, of course, be compelled to take a sledge and extra provisions and so forth to enable us to get back in the event of the aeroplane breaking down; and with the weight of all these things it will be necessary to cut down our fuel to the minimum, or "taking-off" will be very difficult, and lifting the plane for crossing the mountain-ranges impossible. We propose to set off with as much petrol as we can, and then, half-way on the outward journey, just before we get to a range of mountains that we have to cross, to dump half of it, and pick it up again coming back.' The presentation of such details of intention, this tranquil consideration of flight across a polar mountain-range, the dropping of petrol at some lonely spot deep in the Antarctic Circle, and the picking it up again on returning—the assurance of it all—these truly betoken new times. But even more remarkable aerial enterprises are afoot. Recently the Americans, reaching daringly without delay to the maximum, announced that they would hold an 'International Air Derby' round the world, and that prizes to the extent of \$1,000,000 would be offered for the same. At once a committee was commissioned to make a tour round the world to arrange routes and landing-places. It was declared that competitors

would be permitted to use as many machines as they liked in the race, and might employ dirigibles for the whole or any part of the course. In addition, they would be allowed to adopt any other means of transport for making connections between aircraft to the extent of one-tenth of the total distance covered. Alternative routes would be given to competitors for crossing the Atlantic and the Pacific. If in these permissions there seems to be some lapsing from the ideal, it needs to be remembered that round-the-world constitutes the farthest journey possible in the one direction, that it is a long way, that even yet our flight bears imperfections, and that American intrepidity is often qualified with reasonable caution.

* * *

So a new road, the biggest, grandest, widest, most splendid road, the airway of the world, has been opened up for traffic. Soon the planes may be jostling each other upon it; in a small and accidental way they have done as much already. But it is a roomy road, and there is space above for all. Man in these days is always quick with his organisations—a little too quick and thorough, as it has seemed at times, and too spendthrift. Let there be new labour of any kind, and the bureaux and the bureaucrats sniff the scent of it and prepare. The organisation of the airway has begun in a certain manner, and there will soon be much of it, but the preliminary work at least was indispensable. Rules for the air have been needed. They seem to stand for a new law for man under new conditions. The first world air code has been drawn up, and the rules regulating the international traffic set forth. The representatives of thirteen Allied Powers sitting solemnly at the French Foreign Office by the Quai d'Orsay signed the International Aerial Navigation Convention. It is the fashion in these topsy-turvy times to pretend that thirteen is lucky as well as otherwise, and only on the supposition that those thirteen Allied Powers had such a thing in mind could one explain their haste to sign when even the United States and Japan (who were coming later, and would make fifteen) had not done so. The business of Authority, as it seems always, is to interfere and make restrictions, to restrain the individual from the doing of things that it appears he would like and is well qualified to do. Only the necessity of existence, the fear of revolt, and a sense of the ridiculous prevent Authority from interfering with and restricting nearly everything, and would prevent it in this case from laying down special injunctions upon the new airmen, restraining them, as some would say, from approaching Saturn between the rings or landing on the moon. It seems sometimes to be the special business of Authority to anticipate and to make provision for the vanishing impossible. With some enthusiasm it has started here upon a fine new field. Immediately

it has laid restrictions upon the young men who, in search of pleasure and adventure, would go gallivanting along the strange and distant by-roads of the aerial world. They must not be permitted to do as they like in the air; at ten thousand feet, gliding perhaps round peaks of the Himalayas, they must feel it within their bones that there is dusty Authority, with its old quill pens scratching away in gloomy chambers down Whitehall way, ever thinking of restrictions and limitations, and from there exerting its marvellous influence and power upon the bird-men in the upper reaches of eastern atmosphere. By the International Air Code it is established that all pilots who would a-touring go away from their own, their native, land must possess a brevet, which will be granted only after practical tests and an examination dealing with special knowledge of the regulations as to lights and signals, air traffic, air legislation, and so forth. Authority works to new and strange effects sometimes in this hurtling world of ours, and it may be depended upon that the air laws and penalties will be fine things for forensic argument and judicial determination when once the little difficulties of the international airway begin to arise.

* * *

If the pilot is one who takes parties with him in scampers through foreign spaces and is engaged in aerial transport, he must pass harder, severer tests and more complicated examinations. His technical knowledge must be high, and it is ordained that he must be able to fly by night. The new air code is concerned with the nationality of aircraft of all descriptions, and lays down conditions on which certificates of air-worthiness will be delivered. One cannot recall that, the King apart—and this is not a matter of the King—'G' has ever been a capital of special significance to us before, but in

the international airway it stands for the British Empire. It is our initial. France has taken 'F,' and Italy adopts 'Y,' but the United States shows a pretty independence with her choice of 'N.' It is ordained that logs shall be regularly kept for every voyage. But the new Authority, lording it over movement in the air, will in its graciousness do something else than hinder and restrict. International aeronautic charts will be published, and guiding signs be established either on the ground or on roofs. It may come to pass that a sign will be laid on the desert sand and a pointer put on pyramids. An International Meteorological Service is also mentioned, and a new set of forms, the beloved of bureaucrats, will be made for reports, and a code set forth for the transmission of observations. But do not think that, with all these rules well satisfied, the airman may depart for foreign spheres when and how he listeth. Authority must witness him at the beginning and the end. It is a matter of Customs. Outgoing craft must start from aerodromes specially indicated by the Customs administration of the country, which establishments will be known as *aéropacers douaniers*, and aircraft coming in from foreign parts must land at such. It is provided that frontiers shall be crossed only at fixed points indicated on the international chart. A bill-of-lading model has been prepared like unto those that are in use for voyages on the sea. Neutrals, we are told, will abide by these conventions; and as for those who were the enemies of the victorious Allies, they must suit themselves to it. Here is the law of the air; some may see in it a peculiar presumption. But, Government recognising it and treaties directing it, we may feel that the air is more real now than it used to be, that it is at last taken into our great civilisation, and is a part of our most carefully ordered system.

THE PARTS MEN PLAY.

CHAPTER I.—continued.

II.

IT was just before the arrival of the morning papers that Selwyn descended to the dining-room. Helping himself to porridge, he answered Lady Durwent's polite conventional questions.

'And *how* did you sleep?' asked his hostess, putting into the inquiry that artistic personal touch which made it seem as if this were the first time she had asked the question, and he the first guest to whom it had been propounded.

'Lady Durwent,' he answered, smiling, 'I haven't the faintest idea.'

'Then,' said his hostess, triumphantly explaining the obvious, 'you must have slept well.'

Selwyn thought that when he answered Lady

Durwent's query a quick look of relief had passed across the face of Elise. It was for her peace of mind he had lied, as into the hours of dawn he had lain awake, trying to unravel the meaning of the nocturnal scene. He knew that her prodigal brother had been forbidden the ancestral home, but it was hardly necessary that he should lie in hiding like a negro slave dreading the hounds upon his track. And yet, as he recalled the sudden glimpse of Dick's face, Selwyn remembered that there had been a hunted look in the dark-shadowed, luminous eyes. Vaguely he felt that this new development would hinder the understanding reached by Elise and himself during the evening. If only he could go to her and offer his help or solace;

or if she would come to him frankly and let him share the unhappy secret, whatever it was, it might prove a bond of comradeship instead of another element to deepen her consciousness of aloofness.

Still churning these various thoughts, he smiled his greetings to her, and affecting an easy unconcern, took his part in the fashionable agricultural conversation which marks the morning intercourse of country-living gentlefolk. If it had not been that the pigs mentioned were Lord Fitz-Guff's, and the cabbages Lady Dingworthy's—and the accents of the speakers beyond question—Selwyn could have imagined that he was sitting around Hank Myer's stove in Doanville, N. Y., listening to the gossip of the local Doanvillians on earth's produce.

'Ah,' said Lord Durwent, sighting a messenger from over the egg-timer, 'here are the papers.'

Directly afterwards the butler entered with the four morning journals, solemnly presented them to his master (with a little more dignity than a Foreign Minister displays in handing the ambassador of an enemy country his passports), then made his exit with his eyes sedately raised, to avoid noting more than was necessary of the 'behind-stage' aspect of his domain.

'Hello!' said Lord Durwent, perusing the *Morning Post*; 'what's this? Austria has delivered an ultimatum to Servia.'

'What!' cried one of the ladies; 'over that unpronounceable assassination!'

'Dear me!' said the woman who kept record of retired royalties, 'that will upset my dear friend Empress—'

But her voice was lost in the clamour, as every one, deserting breakfast, crowded about Lord Durwent, and half in jest demanded to know what the ramshackle empire had to say for itself.

In a voice that grew tremulous with anger, the host read the details, point by point, and as the seriousness of the thing broke upon the hearers, even the very lightest tongues were for the moment stilled.

With a frown the nobleman looked up as he reached the end of the ultimatum, in which one nation, for its pride, demanded that another should hand over its honour, debased and shackled.

'It is infamous,' said Lord Durwent.

'I tell you what,' said a bland youth named Maynard, who was always in high spirits at breakfast, bored at lunch, 'frightfully bucked' by a cup of tea at four, and invariably sentimental after dinner; 'it would do these nasty little Balkans a lot of good to hold 'em all under water for about three minutes—what?'

'But this is more than a Balkan quarrel,' said Lord Durwent.

'Balkan quarrels always are,' said the youth amiably.

In a chorus of quick questions and answers, in which surmise and conjecture played ducks

and drakes with fact, the party divided into two camps, the majority taking the stand that it was a local affair and would lead to nothing; the minority, led by a retired army captain called Fensome, reading a dark augury for the future. In the midst of all the chaffing Selwyn noticed, however, that the placidity of decorum had been dropped, and both men and women were leaning forward in the unaccustomed stimulus of their brains rallying to meet a new and powerful situation.

The men did not lose that note of easy banter which seemed the rule when women were present, but in the faces of the little group who contended that danger was ahead he could detect the stiffening of the jaw and the steadying of the eye which come to those who see events riding towards them with the threat of a prairie fire driven by a wind.

'But, good heavens!' said Selwyn, in answer to some one's prophecy that war would result, 'surely the big nations can stop it. Germany and you and America—we three won't let Austria cut Servia's throat in full daylight.'

The retired army captain turned a monocle on him. 'You have been in Germany, Mr Selwyn?'

'Yes, just recently.'

'Did you ever hear them toasting *Der Tag*? My friend, it has arrived.—Durwent, old boy, if you will excuse me, I think I shall go to town at noon. If my old bones aren't lying, the thing which a few of us fossils have been preaching to deaf ears has come to pass, and there may be a job for a be-livered old devil like me yet.'

'But,' cried Lady Durwent, whose easily roused theatrical instinct gave her the delightful sensation of presiding at a meeting of the Cabinet, 'what have we to do with Austria and Servia?'

'Hear, hear,' said the bland youth. 'Let 'em hop aboard each other if they like. I think it would be deucedly splendid for us to have another war; we're all fed up—aren't we?—with just enjoying ourselves. But I don't see how we can intrude into those blighters' little show.'

'Exactly,' said Selwyn; 'it's an isolated incident in European affairs. In what possible way can it lead to a rupture between Britain and Germany, as Captain Fensome here predicts?'

The officer referred to shrugged his shoulders. 'It's fairly simple,' he said. 'If, as I think, Germany is behind all this, Servia will appeal to Russia; and remember that the Great Bear is mother to all the Slavs. There will, of course, be jockeying for position, bluff, bravado, and all the rest of it, but France is bound to act with Russia, and with all that explosive hanging around it will be strange if some spark doesn't fall among it.'

'But what has that to do with England?'

'Nothing and everything. The greatest hope of maintaining peace lies with Great Britain. If we had the army we should have, I don't think

there would be a war; but, thanks to our ostrich temperament, we are reduced to a handful of men and our action is robbed of everything but merely moral strength.'

'But that is a tremendous factor,' said Selwyn.

'Yes,' admitted the other dryly; 'but I prefer guns.'

'Then you don't think Britain powerful enough to steady the situation if it comes?'

'N-no. Not unless'—The monocle dropped from the speaker's eye, and with annoying coolness he paused to replace it. 'Do you think America will swallow her doctrine and throw in her lot with us?'

Selwyn bit his lip to keep himself from too impetuous an answer. For the first time he felt an envy for the cool imperturbability of the Island Race.

'If you ask me,' he said, 'whether America will plunge into war at the bidding of a group of diplomats who shuffle the nations like a pack of cards, then I say no. If you older nations over here allow this thing to come to a crisis with a rattling of swords and "*Hoch der Kaiser!*" and "*Britannia Rules the Waves,*" count us out. But should the occasion arise when palpable injustice is being done, and the soul of Britain calls to the soul of America that Right must be maintained, then the Republic that was born—if you will permit me to say so—born out of its resentment against injustice will act instantly.'

'Supposing,' said the other, 'that Germany invades Belgium?'

'But—I understand that Germany has guaranteed Belgium's neutrality.'

The ex-officer showed no signs of having heard him, but shook his head impatiently as one does when annoyed by a fly. 'Supposing,' he repeated, 'that Germany invades Belgium.'

'In that case,' said Selwyn sternly, 'America will be the first to protest.'

'To protest?'

'And fight,' said the American, swallowing a desire to hurl a plate at the monocle.

'You will pardon me,' said Lord Durwent, 'but I do not think we can expect America to become mixed up in this thing. She has her own problems of the New World, and it is too much to hope that she is going to come over here and become embroiled in a European conflict.'

'But, dad,' said Elise Durwent, speaking for the first time, 'if, as Mr Selwyn says, it is clear that a wrong is being committed, America will insist upon acting.'

'Oh, I don't know,' broke in the youth who was always lively at breakfast, but who was beginning to be bored; 'it's one thing to get waxy about your own corns, and quite another when they're on some other blighter's foot—what? I mean, you chaps over there got awfully hot

under the collar when dear old Georgius Rex—Heaven rest his soul!—tried to jump down your throat with both spurs on and gallop your little tum-tums out. But the question is, does it hurt in the same place if old Frankie-Joseph of Austria pinks Thingmabob of Serbia underneath the fifth rib—what, what?'

'Is Britain great enough for such a situation?' asked Selwyn, repressing a smile. 'Would she accept Belgium's crisis as her own?'

'Oh, that's another thing,' said the young man a little uncomfortably. 'We've signed the bally thing, and of course we'll play the game, and'—

'As Maynard says,' interrupted the former army man, 'it's a bigger thing for America than for us. Mind you, I don't say we need America to help us make war, but we do need her help if war is to be averted; and any move of such a nature on her part demands what you author fellows would call "a high degree of altruism." How's that, Durwent, for a chap who never reads anything but the *Pink Un*?'

'Oh, well,' said Lady Durwent complacently, 'it's probably all a storm in a teacup, anyway. Some Austrian diplomat has been jilted for a Servian, I suppose. Isn't that the way wars always happen?' and she sighed heavily, recalling to her mind the classic features of H. Stackton Dunckley.

'That's what I say,' said the bright youth of the morning splendour. 'Why make a horse cross a bridge if it won't drink? Here goes—heads, a European war; tails, another thousand years of peace.—Ah, tough luck, Fensome, old son; it's tails.'

'Then let's begin the thousand years with some tennis,' cried Elise, whose eyes were sparkling, 'immediately after breakfast.'

'Shall us? Let's,' cried the talkative Maynard. 'So lay on, comrades—the victuals are waiting—and "damned be he that first cries, "Hold, enough!"'

III.

With an animated burst of chatter the house-party had given itself over to a thorough enjoyment of the remainder of breakfast. Ultimatums and the alarms of war vanished into thin air, like mists dispelled by the sun. The serious face of the ex-officer and the unwonted air of distraction on Lord Durwent's countenance were the only indications that the morning was different from any other. Tongues and hearts were light, and airy bubbles of badinage were blown into space for the delectation of all who cared to look.

It was during a fashionable monologue of the Court-Circular lady that Maynard, the man of moods, who was sitting next to Selwyn, leaned over and whispered, 'Get hold of the *Sketch*. It's on your right. Pretend you're looking at the pictures. I've got the *Mirror*.'

Wondering what asinine prank was in the young man's mind, but not wanting to disturb the monologist by untimely controversy, Selwyn reached for the *Sketch*, and assumed a deep interest in the very latest picture of London's very latest stage favourite who could neither sing, dance, nor act, and was tremendously popular.

'Excuse me, Lady Durwent,' said the gilded youth when a lull permitted him to speak, 'but would you pass the *Daily Mail*, please?'

'My dear Horace,' said Elise, 'you haven't taken to reading the *Mail*?'

'No, dear one. Heaven forbid! I merely write for it.'

'What!' There was an ensemble of astonishment.

'Ra-ther. I sent their contributed page a scholarly little thing from my pen entitled "Should One Kias in the Park?" If it's in I get three guineas, and I'm going to start for Fiji to escape old Fensome's war.'

'Mr Selwyn,' said Lady Durwent, passing the journal along, 'you have a rival.'

With an air of considerable embarrassment the fair-haired contributor to newspapers opened the pages of the *Daily Mail*, but protesting that he was too bashful to endure the gaze of the curious, he begged permission to retire to the library, there to search in privacy for his literary child.

'I say, Selwyn,' he said, 'you come along too if you're through pecking. Nothing like having the opinion of an expert, even if he is jealous.'

With a promise to return immediately and read the effort aloud, the two men left the table and adjourned to the adjoining room. With a frown of impatience Selwyn was about to demand the reason for his inclusion in the silly affair, when the other stopped him with a gesture and closed the door.

'Quick!' he said. 'Grab that knife—here's the *Sketch*. Look through it for anything about Dick Durwent.'

Seeing that the other was serious, Selwyn spread the paper before him and hurriedly searched its columns.

'Great Scott!' he cried. 'Here it'—

'Sh—sh! Hurry up and cut it out. Right. I'll fix up the *Mirror* in the same way. Now skim through the *Mail*. Got it? By Jove! damn near a whole column. Here'—Maynard ran the knife down the side of the column. 'Now then, old Fensome has promised to get the thing out of the *Post*, and to tell Lord Durwent before he goes to town. But he mustn't hear of it this way, and those women are not to know a word about it while they're in the house.'

Selwyn nodded and looked at the ragged clippings in his hand:

'ATTEMPTED MURDER IN WEST END.'
'WELL-KNOWN NOBLEMAN ATTACKED
BY PEER'S SON.'
'QUARREL OVER DEMI-MONDAINE.'

'Gad, those are juicy lines, aren't they?' said Maynard. 'Won't some of our worthy citizens lick their chops over them, and point to the depravity of the upper classes? Do you know Dick Durwent?'

'I have seen him a couple of times.'

'Awfully decent chap. Screw loose, you know, and punishes his Scotch no end, but a topping fellow underneath. I don't know who the bit of fluff is that they're fighting about, but you can wager a quid to a bob that Dick thought he was doing her a good turn.'

'I wonder who the nobleman is.'

'Can't say, I'm sure. Probably he can't either just now, seeing what Durwent did to him. Of course, it's a rotten thing to say, but if the blighter's really going to die, I hope he's one of the seventeen who stand between me and the Earldom of Forth.'

There was a knock at the door, and an inquiry regarding the newly discovered author.

'Coming,' called Maynard, reaching for the *Daily Mail*. 'Shove those clippings in your pocket, Selwyn, and for the love of Allah help me to select something here that I can pretend to have written. Fortunately I can play the blithering idiot without much trouble.'

(Continued on page 214.)

KAMEHAMEHA II'S BEARS.

By V. POLIAKOFF.

AMONG records of great historical importance, but arid of human interest, the patient student sometimes discovers accounts of really humorous episodes—curious happenings and quaint adventures, quite unimportant, but so amusing! Some time ago I stumbled upon one such—the story of an expedition sent to Russia by a Polynesian monarch in quest of—bears! The whole truth, probably, will never be known, but sufficient facts have been brought to light to make the reconstitution of the story possible.

One afternoon in the first week of July 1822 a beautiful clipper entered the harbour of Peter and Paul in Kamchatka. She flew a flag which to the watchers on shore was absolutely unknown: blue, white, and brown. She seemed to be full of men, and saluted the fort with seven guns. In those days Petropavlovsk was practically the only Russian port on the Pacific, for the Amur River belonged as yet to the Chinese, and Vladivostok was still a desert.

The arrival of any ship in that God-forsaken

port was a rare and great event, much more than that of a vessel so mysterious. The whole population—about three hundred souls—gathered on the foreshore. All the authorities were there, with the Governor at their head. This was Captain Ricord, an English naval officer who, with numerous compatriots, was in the Russian service, and had received, after many adventures, the governorship of Kamchatka as a reward for his distinguished services. It must be remembered that in those days the Colonies did not represent a large field for the enterprise of adventurous men. Russia got many of these, and the trace of their doings is to be found everywhere in the commercial records, and especially in the naval history, of that country.

A boat got away smartly from the newly arrived ship. It was manned by dusky sailors. An officer sat in the sternsheets—a European in naval uniform with much gold braid on it, as well as on his cap. Arrived at the landing-stage, the officer jumped on shore, saluted the group of notabilities, and singling out the Governor, reported that he was Captain John Bowles, commanding the clipper *Sunbeam* of His Majesty Kamehameha II., King of the Sandwich Islands. The *Sunbeam's* cargo consisted of salt, intended by His Majesty as a present to the Emperor and Autocrat of all the Russias, in return for which His Majesty hoped that his 'dear brother' would send him animals fit to be bred in His Majesty's islands—and especially *bears*!

The reader will remember that the Sandwich Islands, discovered by that famous explorer Captain Cook in 1778, were united (by 1795) into one kingdom by Kamehameha I., who has been compared to Peter the Great of Russia. We know that Vancouver helped him to organise an army and collect a small fleet, officered by Englishmen and manned by natives. In 1819, after some internal strife, the throne passed to his son Kamehameha II., who continued in his father's footsteps, but does not seem to have had his great administrative talent. He died in 1824 during a visit to England. We do not know what prompted him to send this extraordinary expedition to Kamchatka, but the fact remains. We may conjecture that, the fauna of the Sandwich Islands being relatively poor, the king hoped to enrich it with specimens from the Czar's domains.

Captain Ricord was very much embarrassed. Here was one monarch communicating with another. How easy to commit a *faux pas*! On the other hand, it was impossible to ask for instructions. In those days the telegraph had not yet come to relieve anxious administrators of their responsibilities. A despatch-rider needed two months to reach Irkutsk, the residence of the Governor-General of Eastern Siberia. More than six months were necessary to send

a report to St Petersburg and to receive an answer! Russian couriers travelled extraordinarily swiftly. From Moscow to St Petersburg, nearly 500 miles, they often went in forty-eight hours; and the record from St Petersburg to Petropavlovsk, on the Pacific, about 10,800 miles, was one hundred and five days. The reindeer, the dog, the horse, and the canoe were all employed by the despatch-rider.

Captain Ricord took counsel with Mr Dobell, another Englishman, at that time Russian Consul-General for the Pacific coast. This Dobell, a very shrewd fellow, had been a merchant in China. He had helped the ships of the Russian navy in every possible manner. His business, in consequence, had been ruined by the Chinese out of revenge. To recompense Dobell and to make up for his losses, Alexander I. had given him the post of Consul-General. Dobell took the matter coolly. First of all, he remarked that Bowles had not a written confirmation of his mission. True, his cargo of salt was very welcome to the colony, and it could be easily arranged to find for him some animals in return, but there was no need to take him too seriously. Ricord accepted this advice, made arrangements with Bowles for unloading the cargo, and promised to have a collection of animals prepared for the return voyage.

Unluckily, we have no information as to what animals were sent to His Majesty of the Sandwich Islands; but we know that amongst them there were a couple of Siberian bears. All this necessitated some delay. Bowles meanwhile became an honoured and much-fêted guest of the Governor and of all the other notabilities. There was quite a little English-speaking colony in the town—the Governor and the Consul-General with their families, the three officers from the *Sunbeam*, and an American merchant residing in Petropavlovsk with his family. There was yet another Englishman in the place—a Cockney who had been valet to some dignitary in Moscow, had stolen his master's valuables, had been caught red-handed, knouted, and exiled to Kamchatka. There this gentleman seems to have been not too badly treated, the 10,000 miles distance from the place of his crime probably helping considerably to throw a veil over his antecedents.

In August there came to Petropavlovsk an interesting personage—John Cochrane, Captain, R.N. To his journal we are indebted for most of the details of this story. Cochrane, finding that in England his craving for adventure could not be satisfied, and being refused by the Admiralty permission to undertake exploration in Africa, decided to cross the whole of Russia to the Behring Straits, and passing these, to come back through the wilds of America—an enormous undertaking in those days, especially as Cochrane had decided to execute the journey on foot! Let us say here that he never got much farther than

Kamchatka, and that his 'pedestrian' journey resolved itself very quickly into using the means of locomotion graciously offered to him by the Russian Government.

Cochrane has left us an exceedingly amusing journal of his wanderings. He mentions meeting the Sandwich expedition in Petropavlovsk. Its members probably attended the ceremony of his marriage with the daughter of the local priest, a young damsel of evidently inordinate

attractions, who captivated the heart of the young Englishman. We can find no trace in Cochrane's journal or in any of the official reports of the date when the *Sunbeam* sailed back to King Kamehameha with the bears and other animals with which good Captain Ricord repaid the salt. Did the bears reach Honolulu? Were they let loose in the mountains to breed? Or did they sink rapidly in the tropical isles? Mystery!

THE INNER CIRCLE.

PART II.

I.

CLUTTON'S in Little Westering was an airy, prosperous shop, where real provisions were sold as distinct from faked imitations. Mr Clutton did not regard you as a customer unless you owed him at least £100.

At the bacon counter a young man was cutting up 'back' with a knife. They despised mechanical bacon-cutters at Clutton's.

A slim, old-maidish, countrified-looking lady entered, surveyed the scene with an impartial eye, and walked at once to the bacon counter, guided only by instinct.

'Can I speak to Mr Merriman?' she said.

'That is my name, madam. What can I do for you?'

'I am Miss Lucy—Gladys's aunt;' and she held out a hand.

If the young man behind the counter had been a prince in a fairy tale, he would have behaved with that calm, distinguished courtesy which princes always display in fairy tales and occasionally lack in real life. Being a plain, stiffish-built young man, Mr Merriman, it pains the historian to state, turned red, looked sheepish, and—wiped his hand on his apron.

'I want to have a frank talk with you,' said the Honourable Seymour Lucy. 'Where can we meet?'

Jake Merriman pulled himself together creditably, and said that if Miss Lucy would do him the honour of taking tea in his lodgings, No. 5 Church Lane, they could talk as frankly as she liked. It was early-closing day.

The first part of the 'frank talk' followed well-worn lines. Mr Merriman cut a far better figure in his own home than he had done behind the counter. He was well set-up, had presentable manners, and an air of ingenuous good-humour that was disarming. He begged his visitor to do the honours of the teapot, and knelt before the fire, making toast, just as Gladys did when she visited the kennel-maid's cottage. Miss Lucy noted the wholesome signs of the room with approval. She picked up a book, and glanced at the back of it. It happened to be Bernard

Shaw's *Candida*, and she was surprised. It had not occurred to Miss Lucy that a grocer's assistant might have a cultivated mind. In the same way, it did not occur to the German General Staff that a grocer's assistant might make a 'topping' soldier.

But she opened fire at point-blank range.

'Mr Merriman, I know more about you than you think,' she said. 'Shall I summarise my information about your career? You were educated at Maidenhead Grammar School, and came out third in an open scholarship examination for Oxford. You were apprenticed to Clutton's at seventeen, joined the army at twenty, and you did well at the front. Your colonel has made a most friendly report. You were recommended for the V.C., and they gave you the M.M. You might also have had your commission twice, but declined it. Why did you do that?'

'I'm afraid I preferred the company of the Tommies to that of some of the officers,' he said with a smile. 'I dare say it was a foolish prejudice.'

'I fancy it was,' said the lady grimly. 'Now you propose to marry my niece, but you have your way to make. I can't help thinking that with a good round sum like, say, £5000, you might'—

'Shall I deal with that point at once?' he asked, still keeping a wary eye on the toast. 'Forgive me for interrupting, but we shall enjoy ourselves so much better if we understand one another. The proposal is that you give me so much money, and that I write to Gladys telling her that "henceforth we are strangers," or something like that.' He looked over his shoulder with a cheerful smile. 'I'm not blaming you for making the suggestion. If our positions were reversed, probably I should do the same. Only, I can't discuss the matter on those lines. I loathe talking sentimentally, but Gladys is the girl of my choice, and she declares I am the man of hers. So, you see, we can't discuss it on a commercial basis, can we? I'm going to butter your toast while it's jolly and hot.'

'Good!' said Miss Lucy composedly. 'I hoped

you would answer like that. So we'll consider that hypothesis dished, and get down to the real problem. Perhaps it will clear the air if I tell you that, although I am Gladys's aunt, my real profession is that of a kennel-maid. I was born inside the ringed enclosure, but I—well, I am now outside it. Any gossip will tell you my story—with the most amusing variations. I mention this to show that you and I are both "outsiders," and can see eye to eye. It makes things easier. Don't you think so? Do you take sugar?'

II.

Broadly speaking, Miss Lucy proceeded to play the part of 'heavy father' in a light, genial way. Gladys would inherit a considerable income when she was one-and-twenty, but what did Mr Merriman propose to live on in the meantime?

Mr Merriman's answer was definite. Mr Clutton was a widower with one daughter; according to the rules of romance, Mr Merriman ought to have fallen in love with her, but, unhappily, Miss Clutton was marrying the son of a bishop. In short, the social scheme was being knocked upside-down, and Mr Merriman confessed that circumstances were embarrassing. But there would be no difficulty as to ways and means. Mr Clutton was taking him in as a partner in about six months. In three years the business would be his own, but in the meantime Mr Clutton would expect his junior partner to live over the shop. He admitted that this was a drawback, but it could not be helped. Gladys knew all about it, and appeared to be resigned.

'You make better toast than my niece does,' said Miss Lucy. 'When I call on her I shall insist on your yielding the toasting-fork yourself. Now, let's look at the thing closely. Thirty years ago I stepped out of the ringed enclosure for a man's sake, and you are asking Gladys to do the same thing—only in a different way. You are asking a fresh-water fish to make itself as comfortable as possible in the sea. She has been brought up in one sphere of life—no, please don't interrupt. I'm not saying it's a better sphere. I only say it's different. She has grown accustomed to daily intercourse with people who are rather indolent and ignorant, and she will mix with people who are by training industrious and competent. She will be out of her element.'

The kennel-maid paused for breath, and Mr Merriman launched his counter-attack briskly.

'May I say this? I was brought up to a peaceful, commercial life, with nothing more exciting than a game of cricket on early-closing day. I found myself transferred to the trenches. No change of element could be more striking, but I managed to make a fair "do" of it. I hold that if people are

young, and have a due share of pluck, they can stand a change of element. There is another thing. I have already pointed out all this to Gladys, and if she has the courage to face it, you can hardly expect me to funk, can you?'

'Light your pipe,' said Miss Lucy abruptly. 'And if you have a cigarette—thanks! So far the argument is level pegging, but I have something up my sleeve. Thirty years ago I sacrificed everything for a man, and it turned out unhappily. It isn't good for all the sacrifice to be on one side. That is my point. No man can be quite worthy of it. No woman can sacrifice all without coming to wonder, sooner or later, if the game was worth the candle. We are only human beings, my lad. Made in the image of God, I grant you, but—made of clay. Do you see my point?'

'I do, indeed,' he said in a low voice. 'And I can't answer the argument, unless you answer it for me.'

'Come, that is talking like a man,' she said. 'If I had a son like you, my dear lad, I should not waste my energies looking after Pekingese spaniels. I should devote myself to a thoroughbred of a different kind. I have a remedy for our difficulty. It is an old-fashioned notion, but I hold that husband and wife should each bring something to the domestic pot. They must meet half-way on common ground. It isn't fair to expect a girl to step down all the way to you. Why not climb up to her?'

'How is that possible?' he asked dubiously.

'You might meet half-way,' said Miss Lucy. 'Suppose I held the ladder while you climbed it? Suppose you went to Oxford at my expense, and'—

'I couldn't accept help in the form of money,' he said quickly.

'There we go,' said his visitor with a laugh. 'My niece must sacrifice her pride, but you won't sacrifice yours. You can't accept a few hundreds from a foolish old woman, with no particular character, because that would be sacrificing your independence.'

Mr Merriman turned red. 'I take back what I said,' he replied. 'I will do whatever you tell me to do.'

'Then go to Oxford for three years, and do the best you can,' she said. 'It will be hateful, I know. You have been four years in the trenches, and you want to begin the sensible business of life. You don't want to go to school again. But your sacrifice won't last for ever—Gladys's will. Afterwards we will think of a profession. You will be eight-and-twenty, and she will be twenty-one—not such a bad age for marrying. And you need not be nervous. She will "stick" the waiting just as well as you "stuck" it in the trenches. That's my plan; it's only common-sense, after

all. A girl might marry a promising young barrister without feeling as if she had given up all for him. Think it over, my lad, and take your time about it. But I must be getting back. I have a kennel of pups worth their weight in gold to look after.'

III.

'Better let him do it,' said Miss Lucy. 'He has a truer hand for toast than yours. I know from experience.'

Two young people agreed to have a toasting competition, and knelt before the fire in Miss Lucy's cottage side by side.

Jake had been at Oxford for a term, and was permitted the high privilege of meeting the lady he adored on neutral territory.

A weekly letter had been exchanged, and Jake's effusions were addressed to 'Miss Smith, the Kennels.' Undoubtedly both he and Gladys had good reason to vote the Honourable Seymour Lucy a brick of bricks.

She was a merciful chaperon, for almost before tea was over she remembered that duty called her to her Pekingese charges, and warning Jake that he had but twenty minutes of paradise left, she quitted the cottage.

Outside, followed by a string of ungainly little dogs, she walked on the grass beside the carriage-drive, looking back now and again towards the lodge gates, as if she expected some one. Presently a victoria came in sight. The countess was returning from a charitable festivity in a neighbouring village. She had abandoned the use of cars during the war, and still clung to the victoria; it reminded her of that substantial period to which she really belonged.

The carriage was stopped when it came alongside the kennel-maid, and the countess beckoned with a royal hand.

'How is Don Juan, Smith?' she inquired.

'He's better, my lady.'

'Smith' held the little beast in her arms, and the countess condescended to fondle him in a way that ought to have made him feel quite well again.

'I will get out,' said the great lady.

'Very good, my lady.'

Don Juan was subjected to the indignity of standing on his four feet, while 'Smith' removed the carriage-rug and assisted her mistress to alight. The coachman was ordered to walk his

horses as far as the yew-tree and back, and the two women were alone.

'Are they inside?' asked the countess, and her voice was intimate and friendly.

'Smith' nodded.

'I wish you could see him, Jane,' she said quietly. 'You would be quite reassured. Has Gladys told you nothing?'

'Nothing. We are afraid of one another.' The poor lady looked troubled. 'I suppose it's my fault. I'm old-fashioned and behind the times.'

'And these two young people are a little in front of the times,' murmured 'Smith.'

'Her strange questions take my breath away,' said the countess, 'and I lose my head. She thinks me unkind, but if she only knew'—

'Some day she will tell her story to you frankly,' said her sister-in-law. 'And when she does, you must try to be very patient. Her heart is full of love, but she belongs to an age that has left you and me behind.'

The countess wiped her eyes hastily, for the carriage had turned round, and they were in full view of coachman and footman.

'I shall never be able to repay you for telling me everything,' she said. 'When are you going to claim your own position in the world? People have forgotten'—

'I shall never return to the ringed enclosure,' said 'Smith.' 'I like my spice of freedom; but your little girl'—

'Our little girl, my dear,' said the countess, laying a plump, smooth hand on the other's arm. 'She will always be yours as well as mine.'

'Thank you, Jane.' 'Smith's' face was crimson with pleasure. 'That repays all. I am quite content.' She glanced at a watch that hung on a somewhat shabby jacket, maid-servant fashion. 'But it is time I packed off that young man to catch his train. Some day our little girl will be a greater comfort to us than you think.'

The countess stepped into the carriage slowly and heavily, and the rug was drawn over her knees.

'You will let me know how Don Juan goes on, Smith.'

'I will, indeed, my lady.'

The victoria rolled sedately away, and 'Smith' took her charges back to their luxurious kennels.

'Our little girl,' she was murmuring.

THE END.

TEASELS.

TEASELS are closely allied to composite plants, but differ in each flower-head possessing a kind of outer calyx, and in the stamens, four in number, being free. In appearance teasels somewhat resemble thistles, and,

like them, have assumed a protective covering of prickles. The leaves afford a fine example of one of the methods whereby plants are preserved against drought. Every pair is so joined together at the lower part as to form a large

cup, where not only is rain collected, but the dews of night, by trickling down the leaves, give a fresh supply of water day by day, even in the hottest and driest weather. The whole plant is covered with hooks and prickles, and seldom is any of it gathered, except the flower-heads after the seeds have fallen out. These flower-heads are very stiff and hard. Called by country-folks barbers' brushes, they form, if not a good-shaped, at least a very penetrating, hair-brush. The prickles serve either as a protection against the attacks of animals or as climbing-organs. They have evidently been adopted by the teasels for defensive purposes, for towards the top of the stem the spines or prickles become more formidable. The flowers, too, are amply protected from the assaults of grazing animals by the long quill-like spine which projects from beneath each floret, as well as by a general covering of very long bracts, armed with spines standing up all around the head.

There are only three kinds of teasel in the British flora. The small one is not uncommon in England, but is absent from both Scotland and Ireland. The common or wild teasel is the best known and most abundant. It is the only species native in Scotland, but in many parts it has been introduced. It is certainly a native of Fife, where it has been growing for centuries along the northern shore of the Forth from Alloa to St Andrews. It is most abundant on the braes between Dysart and Wemyss, but coal-mining and increasing population are tending to its diminution. The plant is rare on the south side of the Forth. It is a biennial, and a rosette of stalked, coarsely toothed, lanceolate leaves is all that makes its appearance the first year. In the second year, with its tall, showy stem and pink flowers, it is a very conspicuous plant. The leaves are opposite and united at their bases, forming a cup as already mentioned. These leaves are among the finest examples of what botanists term a connate leaf. The quantity of water collected by a single pair of leaves is sometimes more than half-a-pint. The connate leaves have been to a certain extent adapted for the capture of insects, whose decaying remains are absorbed by the plant. The stems are everywhere armed with sharp prickles, except where covered by the water in the cup, and here they are quite smooth, so that no ladder of escape is afforded to the drowning victims. The water collected by this teasel has long been believed to be a cure for sore eyes and a beauty-wash for the face. Secretions of insectivorous plants are known to cure warts and corns, and those of the teasel have long been used for this purpose. The old herbalists called the cups of water Venus's basins, and country-people may still be seen, when the flowers are seeding, collecting the water, to be used either for cura-

tive purposes or for beautifying the faces of the village maidens.

The remaining species is the fuller's teasel, and is by many botanists supposed to be a mere variety of the wild teasel, from which it differs only in the scales of the flower-heads being hooked instead of straight. The flower-heads of this teasel form an article of considerable importance to the cloth manufacturer. They are used for dressing certain kinds of woollen cloth. Probably the wild teasel with the straight prickles was at first used until the variety with hooked spines was found to answer the purpose better. It has been cultivated for this use since the thirteenth century, and has been a regular article of commerce in cloth-manufacturing districts for centuries. Its cultivation demands constant attention and labour throughout the year. The heads are cut from the plant with a knife peculiarly formed, and are carefully dried by fastening them to poles, great pains being taken to prevent them getting damp after being cut. Every piece of broadcloth requires from 1500 to 2000 teasel-heads to bring out the proper nap, after which they are useless. Formerly the heads were set in frames so as to form a comb or brush with which to raise the nap, but now they are fixed in regular order upon cylinders, which rotate and perform the operation more rapidly and perfectly. They are made to revolve in such a manner that the hooks of the teasels come in contact with the surface of the cloth and thus raise the nap, which is afterwards cut level. Without this plant cloth manufacture could never have made the progress it has, as the purpose for which the teasel is employed has never been effected with equal success by the most carefully contrived machinery. Wire machines are very generally used, one of the latest being the 'Moser Raising-Gig,' but being less elastic than the fine hooked heads of the teasel, they are more liable to injure the fabric, and are used only for certain kinds of cloth. The teasel-plant is still grown in Yorkshire and other parts of England, but not to the same extent as formerly. French teasels, however, have been largely imported and used, because they are smaller and not so keen as the Yorkshire teasels. Raising-machines with wire cards have ousted teasels in a good many manufactures; but flannels, blankets, rugs, do-skins, beavers, meltons, milled worsteds, and all faced cloths are still raised by teasels. It is remarkable that such an ancient and apparently rude contrivance as the teasel should have held the field so long against mechanical invention and progress. The old poet's tribute to the teasel still holds true:

No skilful art a tool has planned
To match this gift of Nature's hand.

THE MONTH: SCIENCE AND ARTS.

MACHINE FOR WEAVING WICKER-WORK.

THE weaving of wicker-work by power-looms will seem well-nigh impossible to many of our readers, yet factories in which this is being done are already established in the United States, Australia, and New Zealand. Mr Marshall Burns Lloyd, of Menominee, Michigan, U.S.A., is the inventor of a wicker-weaving loom which he has applied successfully to the production of baby-carriages, baskets, fire-screens, and other articles of wicker-ware. Needless to say, the machine is of a complicated nature, and in a written description it is only possible to give a general idea of the way in which it works. The apparatus, of which the writer has a very clear photograph, comprises in the first place a vertical cylinder having a steel-plate ring both at the top and the bottom. Between the rings are two rows of bars, placed about half-an-inch apart. Surmounting the cylinder is another framework of bars formed to suit the shape of the article to be woven. Let us suppose a baby-carriage of circular form, but converging towards the top, is being made. The upright sticks, or the weft, are placed in position round the upper frame by hand. The warp consists of osiers joined together in long lengths and wound on two spools, which are carried upon a fixed tubular frame projecting above the machine, and having a tension-wheel at the top of it. When the upper and lower frames are revolved, the warp, which has been previously threaded through the weft to the starting-point, is drawn down from the tension-wheel through a stationary shuttle placed at the level of the tops of the weft-sticks, which are pushed alternately to each side of the shuttle by a star-shaped wheel. In this way the warp, as it passes through the shuttle, is interlaced with the weft. It must next be pushed down until it lies neatly and closely in layers one above another. This is done by a series of studs projecting between the weft-sticks, and connected by rods to weights sliding between the bars of the lower frame. As the warp leaves the shuttle these studs are pushed out above it one by one, and the weights attached to them pull the warp down into position. Rollers are arranged under the weights, which are caused to climb up a stationary cam until they reach the shuttle, where another cam causes the studs to be withdrawn between the weft-sticks to allow them to pass the warp. Having done this, the studs then come out again, as already described. As may be imagined, very uniform work is produced by this machine, and it is accomplished thirty times as fast as it can be done by hand. Moreover, no skilled labour is required, any in-

telligent person being able to attend to one of these looms without previous training.

THE LARGEST BATTLESHIP AFLOAT.

If certain authorities on naval matters were to have their way, there is little doubt that H.M.S. *Hood* would be the last as well as the largest battleship ever built in this country. It is not in gun-power, however, that the latest super-Dreadnought excels—a similar armament being found in the *Queen Elizabeth*—but in the combination of great gun-power and high speed, the *Hood* having a designed speed of 31 knots, whereas the earlier battleship is only capable of steaming 25 knots. To obtain the higher speed it has been necessary almost to double the power, no less than 144,000 horse-power being required, against only 75,000 in the *Queen Elizabeth*, while the length has been increased from 600 to 860 feet, and the breadth from 90½ to 104 feet. With a draught of just under 30 feet—the same as that of the *Queen Elizabeth*—these dimensions give a displacement (weight of the ship) of 41,200 tons. The armament consists of eight 15-inch guns in four turrets, twelve 5·5-inch quick-firers, and four 4-inch anti-aircraft guns. Curiously enough the thickness of the side armour, as compared with that of the *Queen Elizabeth*, has been reduced from 13 inches to 12 inches. On the other hand, the protection for the barbettes is 2 inches thicker, and that for the gunhouses 4 inches thicker, than in the older vessel, being 12 inches and 15 inches respectively. The main-deck has been thickened also. As the *Hood* was designed after the battle of Jutland, no doubt these modifications are the results of experience. Protection from torpedoes is afforded by modified ‘blisters’ along each side under water, and by the division of the hull into an unusually large number of water-tight compartments. The vessel is propelled by steam-turbines, which drive the propellers through gearing, steam being raised entirely by oil, of which 4000 tons are carried. Originally four battleships of the *Hood* type were ordered, but the contracts for the other three were cancelled soon after the armistice was arranged.

A NEW ASTRONOMICAL MODEL.

In our issue for September 1917 we described a wonderful working model of the sun, the moon, and the earth, designed and made by Dr W. Wilson, F.R.A.S., for the purpose of instructing Chinese students. As this model, which works so accurately that with its help the dates of eclipses may be predicted, has now been placed on the market, a fuller description of it may not be unacceptable to our readers. The main feature of the model is a vertical

spindle carried by a heavy cast-iron tripod with levelling screws in the feet. At the top of the spindle, a gilded globe, six inches in diameter, represents the sun, this globe having an inclined axis, and being capable of rotation at the correct speed relatively to the movement of the earth round the sun. Near the bottom of the spindle is a sleeve which forms the bearing for the main arm to swing on. This arm has a balance-weight at one end, and near the other a vertical spindle which carries a model of the earth in the form of a Philip's 4-inch terrestrial globe, so mounted on an inclined axis as to rotate at the correct relative speed. The centres of the earth and the sun are at the same level, and the plane of the earth's orbit round the sun forms the basis for the adjustment of other features. The moon is represented by a 1-inch white ball having the side away from the sun covered by a black screen to represent darkness. It is mounted on a cross-arm on the spindle carrying the earth in such a manner as to give not only the correct inclination to its orbit round the earth, but also the retrograde motion of the moon's nodes, completing one sidereal revolution in 18·6 years, by means of which eclipses can be correctly predicted. All the motions are caused by driving cords running over fixed pulleys on the central spindle as the main arm is moved round. For some of the motions great accuracy is required—that, for instance, of the retrograde revolutions of the moon's nodes, one cycle of which occupies 18 years 11 days, during which time the moon goes round the earth 223 times. Concurrently the forward revolution of the moon's apsides (perigee and apogee) is shown accomplishing its cycle in 8 years 310 days. The model is thus capable not only of predicting solar and lunar eclipses for many years to come, but also of differentiating them into total, partial, and annular. In order to obtain the exact speeds demanded, the driving-pulleys are so made that they can be slightly expanded or contracted until the right size is found by experiment. The model is made chiefly of polished steel and lacquered brass, and it stands on a black cloth dial with white lettering for the months and other data. This dial is stretched tightly on a circular hoop of spring steel, under the centre of which is a thin steel plate with radial bars. The terminals of the bars project through holes in the cloth dial, and constitute an essential part of the earth's rotation mechanism. While the model normally represents the true motions of the heavenly bodies and their correct relative positions, it is advantageous for teaching purposes to be able temporarily to vary these motions and positions, and thus, by contrast, to bring out more clearly the causal relationship subsisting between the true motions of the heavenly bodies and the corresponding phenomena with which they are related. Thus:

(1) The earth can be made to revolve and rotate

on a vertical instead of an inclined axis, with the result that there would be no succession of the seasons, but, instead, a uniform temperature at any particular latitude throughout the year. (2) The earth's inclined axis, instead of being constantly directed to the pole-star, may be made to assume a constant direction toward the sun (as at the summer solstice), away from the sun (as at the winter solstice), or tangentially to the earth's orbit (as at the equinoxes), giving rise respectively to a perpetual summer, perpetual winter, or perpetual spring or autumn. (3) The moon can be made to revolve round the earth in the plane of the ecliptic instead of in a plane oblique to the ecliptic, resulting in a solar eclipse every new moon and a lunar eclipse every full moon. (4) The revolution of the moon's nodes can be put out of action, and the nodes, instead, made to assume a constant direction, resulting (as far as the nodes are concerned) in a yearly recurrence of any particular eclipse. Special cases are provided by the makers for the conveyance of the model, which has been favourably spoken of by many well-known astronomers and educationists, including the Astronomer Royal, Sir Oliver Lodge, D.Sc., F.R.S., Principal Morgan, and Professor Fleure.

DOORS WHICH ACCEPT PARCELS.

In our issue for January 1919 a 'service' door for hotel rooms was described. The essential feature of the device was a cupboard which formed part of the door, and which could be reached either from the inside or the outside of the room, and it was suggested that it might be applied with advantage to the outside doors of houses and flats. This has now been done in an invention known as the 'Receivador,' which has been specially devised to provide the benefits of the 'service' door for outside doors at which milk, groceries, and other household goods are delivered. In nine cases out of ten it is not at all necessary to see the person who delivers the goods, yet the messenger has to wait until the door is opened, while the individual who attends to it has to leave his or her work—perhaps at the other end of the house. And all this waste of time by two people is incurred because there is no place where the goods can be safely left. The difficulty has been entirely overcome by the 'Receivador,' which consists of two or more cupboards with doors at each side, these being built into an outside door in place of the usual panels. The handles on each pair of doors (outer and inner) are interlocked in such a way that when one is locked the other is unlocked, and *vice versa*. Moreover, when the handle of an outer door has been turned after a delivery has been effected, the door cannot be opened again from the outside until the goods have been taken out of the cupboard and the inner door is closed and fastened. An indicator worked by the door-handle shows whether any

cupboard is occupied or vacant. 'Receivadors' are obtainable with two, three, or four cupboards, and they can be applied to any ordinary wooden door. For houses in which no servants are kept, and which must, therefore, be left unattended at times, these doors should prove an unqualified boon. It may be added that those interested in the subject will find a description of an arrangement designed to serve the same end in the pages of a little book published some months ago, entitled *The Ideal Servant-Saving House*.

'MOVIES' FOR THE HOME.

Machines for showing moving-pictures in the home have been obtainable for some years past, but hitherto such devices have partaken more of the nature of toys than of instruments for giving serious entertainments. This position has been revolutionised by the advent of electrically driven machines which will show standard-size films, one of the best known being the De Vry Portable Cinema Projector. The working of this instrument is exceedingly simple, and the machine, when showing pictures, is boxed up in a case 17 inches square by $7\frac{3}{4}$ inches deep. Electric current derived from an ordinary lamp-socket by a flexible cord and plug serves to light the projector lamp of 400 candle-power, and to run a tiny motor which works the mechanism for passing the film through the projector beam. The parts are so designed as to reduce the risk of fire to a minimum, the film being completely enclosed in the case, while the lamp is contained in a separate metal compartment. Means are provided for varying the power of the lamp and the speed of the film without opening the case. Pictures can be shown with this projector from the size of a post-card up to 8 feet by 6 feet, and the results appeared to the writer to be fully equal to any he has seen at public entertainments. These projectors should prove invaluable for educational and advertising purposes, as well as for entertaining small parties of people, whether privately or in public.

A ONE-MAN AEROPLANE.

Many people have long wondered when the small aeroplane would be obtainable which would bear the same relation to larger machines as that borne by the motor-cycle to the motor-car. The one-man (or woman) aeroplane is now an accomplished fact, such a machine having been exhibited at the recent aircraft show at Paris, while another made its appearance at Hendon a short time ago. The former, known as the *Passé-Partout*, and said to be the smallest machine in existence, has a span of only a trifle over 18 feet, and with petrol and oil for a two-hours' flight it weighs just under two hundredweight. Although the motor develops only 10 horse-power, this machine has a speed of $68\frac{1}{2}$ miles an hour. When tested at Le Bourget in December, the capabilities claimed

for this aeroplane appear to have been fully demonstrated. The machine on view at Hendon had a length of just over 19 feet, and was fitted with folding wings, so that the width could be reduced to 8 feet. It was propelled by a six-cylinder Anzani engine of 40 to 45 horse-power, which gave a speed of 90 miles an hour. The net weight is 580 lb., and enough petrol can be carried for a flight of 180 miles. A self-starter is fitted to the engine, and among other advantages claimed for the machine are the low landing speed of 35 miles an hour, and a capacity for carrying 60 lb. of luggage, which is stowed under the pilot's seat. The price of this aeroplane is in the neighbourhood of £500. Another small machine to be seen at the Paris show had a span of 23 feet 4 inches, a length of 20 feet, and weighed, when empty, only 440 lb. It can carry a load equal to its own weight at 87 miles an hour, and land at a greatly reduced speed.

NEW TYPE OF FAST MOTOR-BOAT.

For many years past the speed of motor-boats has been gradually creeping up until it has now reached just over 70 miles an hour, the record being held by the small American hydroplane, *Whip-po-Will*. Quite recently a new type of craft has been developed at Baddock, Cape Breton Island, Canada, by the noted American scientist, Dr Graham Bell. This design of boat bids fair to establish a new record, as the model described in this note, which is only the fourth, is said to have run at well over 70 miles an hour, and substantial improvements will certainly be made in the near future. In appearance and general features the new type of high-speed craft closely resembles the flying-boat, the body, which is 60 feet long by nearly 6 feet in diameter, being similar in form, while it is fitted with wings having steadying pontoons at their outer ends. The wing area, however, is not great enough to lift the boat clear of the water, although the wings have a considerable lifting effect. Mounted above each wing is a Liberty motor of 350 horse-power coupled to an air-propeller, this form of propulsion still further accentuating the resemblance to the flying-boat. Under each wing at its forward end is a series of narrow steel planes known as hydrofoils. Like the wings of an aeroplane, these are slanted upwards in a forward direction, and their upper surfaces are curved. They are mounted on thin steel struts projecting downwards below the bottom of the boat, and, of course, passing edgewise through the water so as to offer the least possible resistance. These struts are sloped inwards towards the bottom, so that the lower hydrofoils are shorter than the upper ones; they are also narrower. Another important feature is that the hydrofoils are not horizontal, but rise slightly at their outer ends, having, in aeroplane parlance, a dihedral angle, the advantage of which is that each plane enters or leaves the water

gradually as the vessel falls or rises with variations in speed, instead of all at once, as it would do if the hydrofoils were horizontal. Almost at the stern of the boat are two similar sets of hydrofoils, but mounted in one frame, which is pivoted on a spindle passing vertically through the hull. These hydrofoils form the third point of support when the boat is planing, and they also act as a rudder. A big vertical plane is fixed at the top of this rudder frame, which gives steering control by the blow from the propellers when starting, before the boat has attained speed enough for the narrow struts of the after-hydrofoils to be effective. A single set of hydrofoils under the bow, known as a preventer, helps to lift the boat when getting up speed, while checking any tendency to nose-dive. Now let us describe what happens when the engines are started up. At first the boat proceeds through the water like any other craft, but when the speed reaches 16 miles an hour it begins to rise out of the water on the hydrofoils. As the speed increases the boat continues to rise, and more and more the upper hydrofoils come out of the water until the hull is entirely clear. At 60 miles an hour the hydrofoils remaining immersed have an area of only four square feet, upon which the whole weight of the machine (9880 lb.) is supported. To many this lifting-power of 2470 lb. per square foot will seem impossible, but a simple illustration will show what may be termed the solidity of water at high speeds. A type of water-wheel for high falls, known as the Pelton, is driven by a single jet which issues at a high speed. Jets of this character in which the water falls from great heights cannot be broken through by a heavy steel bar, the latter bouncing off the water as if it were a hard solid substance. At 20 miles an hour the boat rises clear of the water, and the thrust of the propellers is about 2000 lb. Above this speed the thrust decreases until it is only 1300 lb. at 34 miles an hour, this figure being maintained at higher speeds, as the decreased water-resistance, owing to the reduced number of hydrofoils immersed, is compensated by the increased air-resistance. The bow hydrofoils leave the water entirely at high speeds. As already suggested, speeds of well over 70 miles an hour may be expected with craft such as the one described, when further experience has indicated the directions in which improvements can be made. One advantage of this type is that waves up to 18 inches in height do not affect the speed or damage the hull, as is the case with ordinary boats at very high speed.

'WEAR AND TEAR' AND INCOME-TAX.

[The following note by Mr John Burns, W.S., author of *Chambers's Income-Tax Guide*, may prove of substantial pecuniary benefit to some of our readers.]

It would appear that a word of reminder and

warning is again called for on an income-tax matter which is very important to many traders. We refer to the proper treatment of the item of wear and tear of machinery and plant. There are many differences of opinion on the rules regulating how that item ought to be fixed and how much it ought to amount to. These are important also, but it is not to them that this note applies. Assume the item ascertained for any particular year: how does it operate on the assessable income and the amount of tax payable? The language of the Acts is not perhaps so absolutely clear as it might be, and that of the papers of directions and instructions issued with the yellow forms of Return is actually misleading. Expressed technically, the question is whether wear and tear is a 'deduction' or an 'allowance.' Expressed in an applied form the question is—given gross profits £1100 and wear and tear £100, and the number of children in the taxpayer's family to be four, is the rate of tax to be three shillings or three shillings and ninepence, and is there to be, or not to be, the children allowances of forty pounds and twenty-five pounds for the third and fourth children; in short, is the trader to pay three shillings and ninepence on £1000 or three shillings on £935, the difference being forty-seven pounds five shillings? Many years ago this was supposed to be a doubtful point, but it was settled a considerable time since that the wear and tear is an absolute deduction from, and reduction of, the actual income, and not a mere tax allowance like life assurance premiums. This corresponds to fact, for the item is passed because so much value has actually been lost to the trader in the depreciation of his plant. Our reason for dealing with the matter is that a prominent trade journal recently contained, in the shape of a letter from a correspondent and an editorial note appended, evidence that some inspectors of taxes are making the serious mistake of insisting on treating the wear and tear as a mere tax allowance, resulting, in such a case as we have figured above, in over-taxing the trader to the extent of forty-seven pounds five shillings. A letter to Somerset House will always lead to such an attempt being nipped in the bud.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

'A-L A Z Y-Z.'

By W. VICTOR COOK, Author of *Grey Fish*.

PART I.

I.

THE clerk in the Land Office at Helen Gap sucked the end of his recording-pen contemptively, as he looked up from the papers before him into the face of John Macdonald Rae. Mr Rae had just filed a homestead claim for a quarter-section—that is to say, 160 acres—in the Tortoise-shell Valley, and had defined with meticulous precision the fraction of Alex County which it was his intention to domesticate.

It is not usual in Montana to obtrude one's self upon another man's business (either by way of question or of advice) unless specially invited to do so. The practice, if carelessly indulged in, is one that has a tendency to affect one's life assurance premium adversely. The clerk at Helen Gap, having duly taken the seventeen dollars and fifty cents demanded by the State for the registration, would certainly have pursued the matter no further, had it not been for the presence in the office of Mrs John Macdonald Rae, a young woman whose extraordinary prettiness and grace threw him momentarily off his balance.

'Guess that'll be in Gentle Jim's district,' said he, without ceasing to suck the end of his pen.

'That so?' said John Macdonald Rae.

'Yep,' said the clerk. 'You know Gentle Jim?'

'I've heard of him,' said Mr Rae.

'Gentle Jim is kinder emperor of Alex County,' said the clerk. 'Cattle millionaire, you know. They say he's awkward if he don't just take to a man.'

'That so?' Mr Rae bit off the end of a cigar.

'This spring, now—Myrtle Spring. Your quarter-section just takes that in. Pretty dry country there, away from the river, Mr Rae. I presume Jim Andrews's ranch stock around there use that spring quite a bit.'

'They're welcome, I'm sure.'

Mr Rae's voice had a pleasant drawl. For all his Scots name, the clerk could not quite place him. He seemed quite at home in the West, though he was dressed with a care which few old-timers would think it worth while to bestow upon themselves. As for his blue-eyed, fair-

haired wife, she made such an alluring picture in her sky-blue summer frock that the clerk could scarcely keep his eyes off her. It was for her sake, rather than her husband's, that he ventured a rash suggestion.

'I presume it would not suit you to take up another section? There's some very fine country about ten miles to the west, just over the county border, Mr Rae.'

John Macdonald Rae lit his cigar—a good cigar, as its aroma testified. 'I've kinder taken a fancy to this quarter-section,' he drawled. 'If it's all in order, we'll be moving along.'

'Oh, it's all in order,' said the clerk dryly. 'Good luck, and look out for A-Lazy-Z!'

Mr Rae picked up his papers, and walked out with his young wife into the street; and the memory of the smile from the blue eyes which the clerk intercepted at the door lasted him pleasantly all that day.

II.

Mr and Mrs Rae pursued their affairs about the town of Helen Gap, a process which involved the visiting of a number of stores and the making of considerable purchases. Many curious glances followed them, for they made a striking pair—the man tall and wiry, with a keen, strong face that discounted the unusual elegance of his clothes; and the wife a creature so frankly beautiful that she would have challenged admiration anywhere, much more so in this Western land where women of any kind were at a premium.

When they sat at dinner in the best hotel after a busy day the blue eyes were sparkling.

'John,' said the young wife, 'I think I love this country already.'

Rae's face lit with pleasure. 'That's fine, Lucy! You will like it better when you know it better. It's a grand country. There's something in the air of it, the crisp, clear sunlight, that makes a man feel big and strong. The great mountains, the forests, the free, wide prospects, the wealth that lies on every hand only asking to be worked for—it's all like champagne to a man's spirit. And when a man has a girl like you to work for and work with, Lucy'—His ardent eyes completed the

sentence, and brought a softer glow into Lucy's face.

'Our honeymoon has been just like a dream,' she said. 'Just fancy, only six months ago I was stuffing lessons into the heads of naughty little boys, back there in dear old dirty Glasgow, and I had scarcely heard of Montana. And then suddenly you came, my wild man of the West, and all the world was different. Oh, John!'

'Say, it makes me feel good to hear you talk like that, Lucy! It's the last day of our honeymoon dream to-day, and to-morrow we have to wake up and butt in and get busy. No more glad rags till we have earned another holiday together!'

'John,' she asked suddenly, 'what did that man in the Land Office mean when he said, "Look out for A-Lazy-Z"?''

'I guess that will just be Gentle Jim's fetish,' was the ambiguous reply.

'And who is Gentle Jim?'

'Didn't you hear what that clerk fellow said? Gentle Jim is the Great Panjandrum of Alex County—or thinks he is.' Rae's strong jaw set a little grimly. 'He's called Gentle Jim because he's the roughest son-of-a-gun in fifty miles round. Gentle Jim is a mighty big punkin, Lucy, and we'll be up against him by-and-by. The ranchers, you see, were the first fellows who did anything with this country. They came along and started ranching on the open Government land—miles and miles and miles of it in the foothills of the Continental Divide—and their stock and their cow-punchers roamed the country at their pleasure. It didn't belong to any one, you see; so why shouldn't they? And then here and there along comes a homesteader, and files a claim, and starts to develop the land, and the State gives him his title to the section he has picked, and the rancher's stock must go graze somewhere else. Naturally the rancher don't like it, and he tries all he knows to make the other fellow quit. You will find Gentle Jim Andrews giving us a call pretty soon.'

'I'm not afraid,' said Lucy, and the blue eyes looked brave.

'You have no cause to be, sweetheart. Montana isn't quite a Sunday-school yet, but the boys have their own code. They don't give themselves headaches studying the law, but there's not one would harm a woman. Guess you could twist Gentle Jim round your little finger. All the same, A-Lazy-Z is a biggish proposition.'

III.

Mr Rae proved a true prophet.

The box shack in the Tortoise-shell Valley in which, a few weeks later, his pretty bride found herself installed was not a luxurious home, but love viewed it through rosy glasses, and hope transfigured it with visions. John built his house and barns himself, and a pretty

thorough experience of Western life had taught him the main requirements of a comfortable habitation.

Gentle Jim did not call in person to welcome the new-comers to his domain, but, as John described it, he left his visiting-card. The Raes had a few milk cows, and for several weeks these inoffensive animals led a somewhat chequered existence at the hands of Gentle Jim's 'punchers,' whose ingenuity and persistence in endeavouring to lure or frighten them away were worthy of a better cause. John Macdonald Rae, however, had not lived ten years in the West for nothing. The milk cows remained securely in his possession. He ploughed a furrow round his quarter-section to divide it from the rest of the State of Montana; and one lovely May evening, as husband and wife sat looking out down the Tortoise-shell Valley, dreaming under the crescent moon, pretty Lucy murmured her conviction that the unseen enemy had given it up as a bad job.

Rae smiled as he filled his pipe. 'Not if I know him, sweetheart. There'll be more fun coming.'

There was. That very night, as they were retiring to bed rather later than usual, Lucy called to John, 'There's some one at the door. Listen, dear.'

He listened. The moon had gone down, and the night was dark. Undoubtedly there was some stealthy movement outside. Nevertheless, he did not at once go out, but having extinguished the light, sat listening for a quarter of an hour or more before he quietly opened the door.

In the clear starlight he made out a horse fastened there by a halter. From the quietness of its movements when it stirred he guessed that its hoofs were padded. It was a good horse, and Rae talked to it like a good horseman. When he had talked it into confidence, he went indoors and fetched a sheepskin. With deft fingers, and soothing the lonely steed with soft words, Mr Rae attached the sheepskin to its tail, and this accomplished, turned the animal loose. The horse moved off. Flippety-flap went the sheepskin on its hindlegs. The horse, a half-broken, spirited creature, went off into a mad gallop, and John Macdonald Rae stood listening to the dull sound of its hoof-beats diminishing down the valley. Then he returned, smiling grimly, to his rest.

'Guess we've scored the first trick, sweetheart,' said he, and told his wife what he had done.

'But what does it mean, John?' The blue eyes were wide with wonder.

'It means,' said John, caressing his wife's fair hair, 'that Pete Jorsen, Gentle Jim's night herder, tied that horse there, intending to come back early in the morning with witnesses, and claim that it was stolen, and recognise me as the man they saw take it. Many's the man that

has been sent to Deerlodge (the State prison) that way. But I'm not for Deerlodge so easily. We'll go and find the sheepskin in the morning, Lucy. I'd hate to lose that sheepskin. The horse will kick that off easy enough. He was as scared as a jack-rabbit in a harvest-field.'

The next day Mr Rae judged it expedient to coach his young bride in some of the crooked devices that the baffled rancher might see fit to employ to retrieve his defeat. Lucy listened with amazement and indignation to the lesson in devious dodges, but when her experienced man had 'put her wise,' as he called it, her lips took a firm set, and she nodded her fair head sagely.

'You see, my dear,' said John, 'though the A-Lazy-Z boys would never hurt a woman, they might try to trip me up sometime when I'm away to Glendair, by taking advantage of your inexperience.'

'Let them try—the cowards!' cried Lucy hotly. 'I'll show them that a Glasgow girl can keep her end up, John!'

IV.

A week later Lucy's opportunity came. Her husband had gone to Glendair with the wagon, and she had been out herding the cows. She returned to the homestead to find the fenced corral in the occupation of a number of steers, and the gate of the corral shut upon them. The steers all bore the 'fetish' of Gentle Jim Andrews, a big A, with a Z swinging to its lower corner—the symbolic 'A-Lazy-Z' against which the Land Office clerk had warned them.

Pretty Lucy was frankly scared. It would be several hours before her John could return, and here she was left alone with half-a-dozen young steers ramping in the corral, and the milk cows to protect. She dared not put her cows in the corral, and she dared not open the corral gate and turn the steers out, lest they should mix themselves up with the cows in their flight, and she be unable to sort them out. On the other hand, she dared not leave the steers where they were, for at any moment Gentle Jim's men might appear, and charge her husband with having their stock in his corral—circumstantial evidence against which no protestations of innocence could avail, especially before a jury probably composed in large measure of Jim's friends or henchmen.

Lucy stood for a few moments desperately pondering the position, and then with a woman's swiftness made up her mind. She tied the cows outside the corral, and running into the house, returned with an umbrella, to the handle of which she had fastened the largest and gaudiest piece of red cloth she could find. She unlatched the corral gate, and set it slightly ajar; then, running round the fence to the side opposite the gate, she climbed up on the fence, opened the umbrella, and, with as terrifying a shout as she could produce, hurled the open umbrella with its trail of flaming red right in

among the steers. It was rather a forlorn hope, but it succeeded beyond her expectations. With one accord the frightened brutes bolted for the half-open gate, crashed it wide open, and stampeded away as if the fiend were at their heels. Trembling with excitement, Lucy returned to her cows, loosed them, and drove them in, then, fetching her husband's Winchester from the shack, mounted guard with it at the corral gate. And there John found his fair sentinel when he drove back his team in the summer dusk.

A fierce light came into the homesteader's eyes at the sight of the anxious little figure with the rifle, and though, when he had heard her story, he laughed, it was rather to encourage his pretty garrison than to relieve any mirthful feelings of his own. 'Put away the gun, little girl,' he said, taking it from her. 'You beat them fine. There's not a puncher in Alex County would have thought of what you did. My! I'd give fifty dollars to see Gentle Jim's face when he hears how he has been fooled by a woman, and she not six months out from bonny Scotland! But things are goin' to get kinder lively, Lucy. Jim won't stand for that. He'll put on his thinking-cap, and the A-Lazy-Z boys will be mad to get level with me. We're going to be right up against the whole outfit now. But we'll roast old Jim yet!'

Lucy, walking back to the shack with her man's arm about her, felt her courage revive. 'I'd like fine to see this Jim Andrews, John. What does he look like?'

'You'll see him, sure, before we're through, sweetheart. He's a mountain of a man, nearer seven feet than six, I guess, with a hawk face and a two-foot beard. He's as strong as a bull and as cunning as a fox. He's a dead-shot, and I presume he could fell a steer with his fist. Oh, he's some boy, is Jim. But he has his points. He wouldn't kill a man unless it was fair fighting. And he would never harm a woman.'

V.

After the episode of the umbrella there was peace for many days at Myrtle Spring. Rae and his wife came and went about the affairs of their homestead, and the place grew and prospered. The A-Lazy-Z ranchmen who brought their cattle from time to time to water at the spring seemed friendly, and no reference was ever made on either side to the state of siege in which both sides knew the homestead lived. Gentle Jim Andrews kept to his home ranch some twenty miles away in the foothills, and Lucy's desire to meet him remained ungratified.

One hot August noon Rae and his wife returned home from their work to find, suspended on the corral fence, two quarters of a freshly killed steer, the hide of which, neatly rolled up, lay on the ground beside the fence. Not a soul

was in sight. Rae put his hands in his pockets and stood frowning.

'If we were to turn that hide over, what kind of a mark do you think we should find?' he asked.

'A-Lazy-Z,' smiled Lucy.

'No good tying a mat to that,' said Rae.

'Perhaps it's a peace-offering,' said hopeful Lucy.

'Perhaps it ain't. We'll leave it there while we go and have some dinner.'

But when they got into the house, they found a third quarter hanging in the shack kitchen.

'There's four quarters to a steer,' said John Macdonald Rae sagely. 'Guess I'll look around for the fourth, while you get dinner ready, my girl. I'd hate to lose any of that meat.'

He went out again, and, just to make sure, turned over the hide by the corral fence. It was the hide of a red-and-white steer, and in the midst of a large white patch there was the sign he expected, the A with the swinging Z, which proclaimed the animal the property of Andrews. Thinking hard, Rae walked on to explore his holding. It was not long before, in a clump of quaking asp, he found the fourth quarter. By this time he had thought out his problem.

Like many a careful homesteader, Rae kept a brine-barrel for preserving purposes. It was empty of meat—the rascals, he reflected, must have kept close watch on him to know how short he was of meat. He carried back the quarter from the trees and put it in the barrel. Then he went and fetched the two quarters from the fence, and put them also in salt, Lucy watching him with curious glances.

'That fills it up,' said her husband. 'Guess we'll have to cut a good T-bone steak off that other quarter and cook it. It won't keep this hot weather. We'll start on it right now.'

In a short time the shack was redolent of the appetising odour of cooking meat.

'They'll be here soon,' Rae prophesied confidently. 'I'm going outside for a while, little girl. When I come back we will have dinner.'

When Rae returned presently, he left behind him, between the corral and the house, a large patch of fresh blood on the ground.

'It's going to be stud poker this time, Lucy,' said he grimly, as they sat down to eat. 'That fellow reckons he's got me this time, anyway. There's the hide with the brand on it, and if I am wise enough to bury it or hide it some way, there's the meat, which they know we need, and especially there's the quarter right here in the house. And if I don't fall for any of those games, they figure on the last quarter hid away in the bush. Oh, it's going to be a lovely game! Hello!'

There was a hail from outside. John Macdonald Rae went to the door, where Pete Jorsen was sitting on his horse.

'Say, Rae,' said Pete, 'have you seen a stray Hereford anywhere around?'

'Was it a four-year-old, with a lot of white on it?' asked Rae with child-like innocence.

'Yes,' said Gentle Jim's puncher eagerly. 'Seen him?'

'There's his hide on the corral fence, and there's three quarters of him in brine in the house. The weather is too hot to keep fresh meat.'

Pete's jaw dropped, and his eyes opened wide. 'But that's an A-Lazy-Z steer you've killed,' said he, not knowing what to make of it.

'Sure,' Rae answered coolly. 'Do you want the meat?'

'I'll have to report that on the ranch,' said Pete.

'Sure. Andrews might want the meat,' Rae readily agreed.

STRANGER THAN FICTION.

ONE of the most amusing chapters in *The Golden Butterfly* is that which records the sumptuous dinner given at the Langham Hotel to the representatives of art, science, and literature by Gilead P. Beck, the American millionaire, whereat many of the most notable celebrities of the day were present. Jack Dunquerque, it is related, spoofed the rich American by introducing to him, as the guests at the banquet, a party of impostors, cleverly made up by perruquier and costumier to represent Thomas Carlyle, Algernon Swinburne, Alfred Tennyson, John Ruskin, George A. Sala, Charles Darwin, Thomas Huxley, and Frederick Leighton, R.A. A description of the chrysalis of truth from which the butterfly of fiction emerged nearly half a century ago may possibly be of interest to readers at the present day.

Some short time before that chapter in the novel was written, the writer of this article met, at the office of W. Tinsley, the publisher, in Catherine Street, Messrs Besant and Rice, to whom he related the following story, to which they listened apparently with great interest. At its conclusion they asked permission to make use of it in the novel they were then collaborating on which was running serially through the columns of *The World*. Needless to say, the permission was instantly given, and they were informed that the incident was quite at their service to use in any way suitable for their purpose. The joint authors of *The Golden Butterfly* cordially expressed their gratitude, promising to utilise the idea, but stated that the anecdote as narrated was so extraordinary that some modification was

absolutely necessary to bring the story into a form that would not outrage the reader's sense of probability.

H. M. Stanley had recently returned from his successful search after Livingstone, in the heart of the Dark Continent, and he was, for the time being, the lion whom the British public delighted to honour; his wonderful adventures, hairbreadth escapes, and indomitable pluck formed at that period the principal topic of general conversation, to the exclusion of other subjects. On the afternoon on which the following scene occurred I had come back from a short yachting cruise, considerably bronzed by the sea-breezes. My white hair and dark moustache, combined with a short compact figure, rendered my general appearance not unlike that of the great explorer—a resemblance further intensified by the nautical rig-out and peaked naval cap which I affected. I was standing at the bar of the old Gaiety restaurant, probably discussing some intricate problem of the higher mathematics with the intelligent damsel who dispensed creature comforts in her leisure moments, when there gradually collected round me five literary friends, each of whom, strange to say, more or less resembled some prominent public character. First was Bracebridge Hemming, B.L., who bore a wonderful likeness to the Prince of Wales; another in the group was a near relative of his, an ex-officer of the Royal Navy, marvellously like the Duke of Edinburgh. Then Dr Henchman, with his gold-rimmed spectacles and full gray beard, taken in conjunction with his height and general appearance, might easily have passed for Wilkie Collins; another, one Richardson, prided himself on his striking resemblance to Frederick Leighton, R.A.; whilst the last to join the party could very readily have been mistaken for George Augustus Sala—and certainly his crimson neck-tie, his black moustache, and the white waistcoat were in evidence to deceive the unwary.

These several personal similarities had frequently formed the subject of good-humoured banter among ourselves, yet my own resemblance to Stanley had never struck myself or any of our coterie. However, to proceed with the story: it became apparent on inquiry that none of the six cronies present had any important engagement to occupy him for that particular afternoon, so a suggestion was made that we should form a pool, with myself as treasurer, and that the amount subscribed should be expended on a snug little dinner at a famous restaurant in Soho.

This being carried *nem. con.*, we proceeded to put our festive plan into execution, and chartering a couple of four-wheeled cabs, were driven to Church Street. Outside Kettner's restaurant we found a small crowd collected. I was in the foremost vehicle, and was the first to alight. As I stepped out one of the bystanders exclaimed, 'There's Stanley!' Immediately grasping the

situation, I rose to the occasion, raising my cap with an air of gracious condescension. This acknowledgment was the signal for a ringing cheer. Then in an awed whisper came the announcement, 'That's the Prince of Wales!' 'And ain't that the Duke of Edinburgh?' 'Why, yes; of course it is Leighton, the great painter; Wilkie Collins, the author; while blessed if the last chap ain't Sala—you could spot him anywhere.' Each, on being recognised, bowed courteously, receiving a cordial ovation from the spectators.

Hearing the hubbub which our distinguished arrival had created, the proprietor, Mr San Giorgi, who had recently married the widow of Kettner, advanced to the entrance, and to him I proceeded to address myself. 'We desire to have a private room. Please remember that we are here incog. Nothing would annoy His Royal Highness more than a public demonstration—you quite understand?' In compliance with my demand, our party was respectfully ushered into a comfortable room on the first floor, where presently was served for our delectation one of those *recherché* repasts for which the establishment was justly renowned. We all entered with gusto into the spirit of the impromptu practical joke, and played each his assumed rôle for all it was worth, as though to the manner born, so to speak.

During the course of the meal the proprietor entered, with a waiter carrying half-a-dozen bottles of champagne, and begged that we should accept this contribution towards our conviviality as some slight recognition of the honour we were conferring on his establishment. We graciously accepted the offering in the spirit in which it was tendered, and felt more than ever in duty bound to live up to the characters that had been thrust upon us. My own adventures in Africa would have appalled the lion-hearted Stanley himself; the opinions on art enunciated by 'Leighton' might have proved a revelation to his prototype; the criticism on the decadence of modern fiction would have brought tears into the eyes of Wilkie Collins could he have heard his own utterances; while Sala would have been reluctantly compelled to confess that, in face of the post-prandial eloquence of his *alter ego*, he himself was very small beer.

The waiters must have reaped a rich harvest in perquisites on the occasion of our memorable symposium, for every time our door was opened—an operation which appeared to occur more frequently than necessity demanded—a cluster of inquisitive spectators could be seen on the landing, peering over the shoulders of the attendants, all eager to catch a glimpse of the great men within, and anxious to overhear a few sentences of the brilliant conversation in which they indulged.

As the hours wore on the sense of important personality became vastly increased, till each member of the distinguished sextet at length became thoroughly convinced in his own mind

that Providence had been guilty of an inexcusable blunder in not having placed him in a more important sphere of action, and more perfectly confident that the real characters whose outward personalities we had assumed might have studied with considerable advantage the dignified deportment and oratorical fluency with which the respective rôles had been invested by those who played them.

Before making our exit from the *Hôtel du Pavillon*, we of course congratulated the host on the admirable manner in which we had been catered for, thanking him for his personal attention, and reiterating our desire that the proceedings of the evening might be preserved a profound secret. Having bestowed liberal largesse on the waiters, we drove away in three hansom cabs.

Never shall I forget the princely air with which Bracey directed his driver to take him to 'Marlboro' House.' Then I shouted, 'Royal Geographical Society'; while the great G.A.S. hiccuped out in a stentorian voice, 'Drive like Hades to *Daily Telegraph*—offish—(hic)—Fleestreet.' These varied directions were loudly expressed in order to impress the staff of the hotel, who were all assembled on the steps to lend *éclat* to our departure. However, once we were clear of the neighbourhood of Soho, we stopped our cabs by prearranged signal, and gave a general order to make for the Gaiety restaurant, where, over a doch-an-doris, we enjoyed a retrospect on our humorous adventure.

Alas! of those noble six humbugs only the writer remains to tell the tale.

THE PARTS MEN PLAY.

By ARTHUR BEVERLEY BAXTER, Author of *The Blower of Bubbles*, *Merrie Gentlemen*, &c.

CHAPTER XI.—THE RENDING OF THE VEIL.

I.

THE house-party at Roselawn had hurriedly broken up, and only Selwyn remained.

In view of the scandal about Dick Durwent, although it was not spoken of by any one, he felt that it would have been more delicate to leave with the other guests. But it seemed as if the Durwents dreaded to be alone. His presence gave an impersonal shield behind which they could seek shelter from each other, and they urged him so earnestly to remain that it would have been ungracious to refuse.

It was the evening of August 4th, and the family circle, reduced to four, had just finished dinner. There had been only one topic of conversation—there could be but one. Britain had given Germany until midnight (Central European time) to guarantee withdrawal from Belgium.

After dinner the family adjourned for coffee to the living-room, and, as was his custom, Lord Durwent proffered his guest a cigar.

'No, thanks,' said Selwyn. 'If you will excuse me, I think I will do without a smoke just now.—Lady Durwent, do you mind if I go to my room for half-an-hour? There are one or two matters I must attend to.'

Half-way up the stairs he changed his mind, and went out on the lawn instead. Darkness was setting in with swiftly gathering shadows, and he found the cool evening air a slight solace to a brow that was weary with conflicting thoughts.

America had not acted. There towards the west his great country lay wrapped in ocean's aloofness. The pointed doubts of the ex-army captain had been confirmed—America had stood aside. Well, why shouldn't she? It was all very well, he argued, for Britain to pose as a protector of Belgium, but she could not afford to do otherwise.

It was simply European politics all over again, and the very existence of America depended on her complete isolation from the Old World.

Yet Germany had sworn to observe Belgium's neutrality, and at that very moment her guns were battering the little nation to bits. Was that just a European affair, or did it amount to a world issue?

If only Roosevelt were in power. . . . Who was this man Wilson, anyway? Could anything good come out of Princeton? . . . In spite of himself, Selwyn laughed to find how much of the Harvard tradition remained.

If America had only spoken. If she had at least recorded her protest. Supposing Germany won. . . .

Supposing

He kicked at a twig that lay in his path, and recalled the wonderful regiments that he had seen march past the Kaiser only three months ago. Who was going to stop that mighty empire? Effeminate France? Insular, ease-loving England?

Passing the stables, he started nervously at hearing his name spoken.

'Good-evening, Mr Selwyn. It's pleasant out o' doors, sir.'

It was Mathews, the head-groom of the Durwents.

'Yes,' said the American, pausing, 'very pleasant.'

'It looks sort of as if we was going to have some ditherings with Germany, Mr Selwyn.'

'It does. I don't see how war can be averted now.'

'It's funny Mister Malcolm ain't home yet, sir. Has his mobberlizing orders come?'

'There's a War Office telegram in the house. I suppose his instructions are in it.'

The groom shook his head and swung philosophically on his heels. He was a broad-faced man of nearly fifty, with an honest simplicity of countenance and manner engendered of long service where master and man live in a relation of mutual confidence. He sucked meditatively at a corn-cob pipe, and Selwyn, changing his mind about a cigar, produced a case from his pocket.

'Have one, Mathews?' he asked.

'No, thank 'ee, sir. I'm a man of easy-going habits, and likes me old pipe and old woman likewise, both being sim'lar and the same.'

With which profound thought he drew a long breath of smoke and sent it on the air, to follow his philosophy to whatever place words go to.

'If Germany and us puts on the gloves,' ruminated Mathews, 'I'll be real sorry Mas'r Dick ain't here. He's a rare lad, he is—one of the right breed, and no argifying can prove contrariwise. I always was fond of Mas'r Dick, I was, since he was so high, and used to come in here and ask me to learn him how to swear proper like a groom. Ah, a finelad he was; and—criky!—he were a lovely sight on a hoss. Mister Malcolm he's a fine rider hisself, but just a little stiff to my fancy, conseckens o' sitting up on parade with them there Hussars o' hisn. But Mas'r Dick—he were part of the hoss, he were, likewise and sim'lar.'

Selwyn nodded and smoked in silence. He was rather glad to have run into the garrulous groom. The steady stream of inelegant English helped to ease the torture of his mind.

'Has milord said anything about the hosses, Mr Selwyn?'

'No. What do you mean?'

'Nothing much, sir, excep' that it's just what you can expect from a gen'lman like him. He comes in here this arternoon and says to me, "Mathews," he says, "if this here war comes about it'll be a long one, and make no mistake, so I estermate we'd better give the Government our hosses right away, in course keeping old Ned for to drive." Never twigged an eyelash, he didn't. No, sir. Just up and tells it to me like I'm a-doing to you. "Then," I says, "you won't be wanting me no longer, milord?" And he says, "Mathews, as long as there's a home for me, there's one for you," and he clapped me on my shoulder likewise as if him and me were akala. It kind o' done me in, it did, what with the prospick o' losing my hosses—them as I'd raised since they was running around arter their mothers like young galathumpians—and what with his speaking so fair and kindly like. Well—criky!—I could ha' swore; I felt so bad.'

'It will be a great loss for Lord Durwent to lose his stable.'

'Ah, that it will. But this arternoon, arter what I'm a-telling you, he just goes through with me and says, "Nell's looking pretty fit," or "How's Prince's bad knee?" just as if nothink had happened at all. I says to myself, "Milord,

you're a thoroughbred, you are," for he makes me think of Mister Malcolm's bull-terrier, he do. Breed? That there dog has a ancestry as would do credit to a Egyptian mummy. I've seen Mister Malcolm take a whip arter the dog had got among the chickens or took a bite out o' the gamekeeper's leg, him never liking the gamekeeper, conseckens o' his being bow-legged and having a contrary disperation, and do you think that there dog would let a whimper out o' him? No, sir. He would just turn his eye on Mister Malcolm and sorter say, "All right, thrash away. I may hev my little weaknesses, but, thank Gord! I come of a distinkished fam'ly."'

They smoked in silence for a few minutes.

'No, sir,' resumed the groom, pushing his hat back in order to scratch his head, 'he never whimpered, did milord; but I saw when he got opposite Mas'r Dick's old mare Nell that he felt kind o' bad, and he didn't say much for the better part o' a minute. Mr Selwyn, I'm a bit creaky in my jint and ain't as frisky as I were, but I'd be werry much obliged to be sent over to this here war and see if I couldn't put a bullet or two in some o' them there sausage-eaters.'

'Well,' said the American moodily, 'you may get your chance.'

'Thank 'ee, sir. I hope so, sir.'

'Good-night, Mathews.'

'Good-night, sir. Thank 'ee, sir.'

Selwyn moved off into the network of shadows. Looking back once, he saw the weather-beaten groom with hands on his hips, tilting himself to and fro in benicotined enjoyment of some odd strain of philosophy. Good heavens! was that the way men went to war!—as if it were a hunt with an equal chance of being the hound or the hare. 'Sausage-eaters'—what a phrase to describe those eagle-helmeted supermen of Prussia's cavalry! And this little island of pipe-smoking, country-side philosophers and pampered, sport-loving youth—this was the country, heart of a crumbling empire, that had ordered the gray torrent of Germany to alter its course and flow back to its own confines. It was absurd. It was grotesque. It was a sporting thing to do, but would it mean the collapse of the sprawling, disjointed British Empire, linked together by a flimsy tradition of loyalty to the Crown?

Scotland would be faithful, not so much to England as to her own instincts. Even if England were the heart of things, Scotland was the brain, and more than any other part supplied the driving-power for the wheels of empire. But what of rebellious Ireland and the distant Dominions isolated by the seas? Would they seize this moment of Britain's mad impetuosity and declare for their own independence? It was the history of nations—and did not history repeat itself?

Canada, of course, would be governed in her actions by the mighty, neighbouring Republic. That was inevitable when the young Dominion's

life was so dominated by that of the United States. But what of the others? . . .

Thus for half-an-hour queried the man from America. He was about to turn into the house, when he glanced once more in the direction of the stables. It was too dark to distinguish anything, but there was the glow from Mathews's pipe as it faintly lit the surrounding darkness.

II.

Eleven o'clock.

'Austin.'

He had been sitting in the library talking to Lord Durwent, but the latter had just left the room to answer a phone-call from London. Elise, who had been playing the gramophone in the music-room, shut the instrument off and hurried to the American's side.

'Yes, Elise?' He tried to rise, but she pressed him back and sat on the arm of the huge chair, looking down at him with a face that was glowing with excitement. Her eyes were like jewels of fate lit from within by some magic flame, and a mutinous lock of hair fell on the side of her face, almost touching the crimson lips. There was so much magnetism in her beauty, such a heaven in the unconquered warmth of her impetuous being, that Selwyn gripped the arms of his chair to help to restrain the mad impulse to grasp her in his arms and smother those lips and the flushed, satin cheeks in a tempest of kisses.

'Yes, Elise?' he repeated, clearing his throat.

'Listen, Austin. I can't stay inside any longer. I think my blood is on fire. Will you come with me to the village?'

'At eleven o'clock?'

'Yes. The news from London will reach the village first, and I want to be there when it comes. We shall have to hurry if we are to make it in time.'

'I'm at your service, Elise.'

'Right-o. I'll let the mater know. I'll just run upstairs and put something easy on, and I'll meet you at the front of the house. You had better change too.'

A few minutes later she joined him on the lawn. They had just reached the road which led to the porter's lodge, when, without a word of warning, she grasped his hand, and, half-running, half-dancing, pulled him forward at a rapid pace. With a laugh he joined in her mood, and, running side by side, they sped along the drive, while startled rabbits leaped across their path, and melancholy owls hooted disapprobation. As if the fumes of madness had mounted even to the skies, dark flecks of cloud raced headlong across the starry heavens.

They were mad. The world was mad. He wondered whether his brain might be playing some prank, and this absurd thing of two young people laughing and running to discover whether or not a nation was at war would prove a pointless jest of unsound imagination.

'Come along,' she cried. 'You're dragging.'

Then it wasn't a dream. The sound of her voice whipped the wandering fantasies of his brain into coherency. With a shout he jumped forward, and ran as he had not done since that one great game when, as a 'scrub,' he had his chance against Yale.

'Oh-oh-oh,' she laughed, 'I'm—winded.'

He caught her up in his arms as if her weight were no more than a child's, and carried her forward a hundred paces. His strength was limitless. He felt as if his body would never again know the lassitude of fatigue.

His pulses were throbbing with double fever: that of the world and his own hot love for her. Yes, it was love. What a fool he had been ever to doubt it! His last thoughts at night were of her; the last word whispered was her name; the last picture shrouded by the approaching mists of sleep was of her face. What was morning but a sunlit moment that meant Elise? What was the day—what were the years—what was life—but one great moment to be lived for Elise—Elise?

'Put me down, Austin. There! you'll be tired.'

'Tired!'

But her feet had touched the ground, and she was away again by herself, like a tantalising sprite of the woods. The errant lock had been joined in its mutiny by a wealth of dark-hued, auburn hair, blowing free in the reckless summer breeze.

Out of the estate and along the highway, shadowed by tall bushes; past cottages hiding in snug retreat of vines and flowers; past the cross-roads, with their sign-post standing like a gibbet waiting its prize; past the inn on the outskirts of the village, with its creaking sign, and its neighing horses in the stable; past the church on the rise of the hill, with its graveyard and its ivy-covered steeple—and then the village.

Gathered in the square they could see a group of people listening to a man who was reading something aloud.

'It's the rector,' said Elise. 'Let us wait a minute. Can you hear what he is saying?'

The voice had stopped, and the crowd broke into a cheer that echoed strangely on the night-air. It had hardly died away when a quavering, high-pitched voice started 'God save the King,' and with a sturdy indifference to pitch the rest followed, the octogenarian who had begun it sounding clear above the others as he half-whistled and half-sang the anthem through his two remaining teeth.

'That's old Hills!' cried Elise, laughing hysterically. 'He was at Sebastopol.'

The crowd was coming away.

Some were 'boisterous, others silent. A girl was laughing, but there was a strange look in her eyes. Bounding ahead in high appreciation of the village's nocturnal behaviour, a nondescript hound was preceding an elderly widow who was

weeping quietly as with faltering step she clung to the arm of her son, who was carrying himself with a new erectness.

Behind them walked Mathews the groom, corn-cob pipe and all, shaking his head argumentatively and squaring his shoulders.

An Empire had declared war.

III.

Elise entered the post-office to telephone the news to Roselawn, and Selwyn was left alone. It was only for a few minutes, but in that brief space of time his whole being underwent a vital crisis, which was not only to change the course of his own life, but was to affect thousands who would never meet him.

The creative mind is ever elusive and unexpected in its workings. In it the masculine and feminine temperaments are fused. The inventive brain leaps to conclusions—erroneous, it may be, but sustained by the feminine conviction that what is instinctive must be true. Selwyn's was essentially a creative mind, prone to emotionalism and to inspiration. With men of his type logic is largely retrogressive; the conclusion is reached first—the reasons follow.

A few days before his imagination had been strangely stirred by the swiftness of thought which at twilight in England could visualise New York at noon. Simple though the scientific explanation might be, it had left him with a sense of detachment, almost as if he were on Olympus and the world spread out below for him to gaze upon.

That feeling now returned with redoubled force.

The group of villagers had parted into many human fragments. He could hear the hearty invitation of the innkeeper for all boon spirits to join him, free of expense—and regardless of the liquor laws—in a pint of bitter, to drink confusion to the enemy. But to Selwyn they seemed creatures of another planet—or, rather, that he was the visitor in a world of strange inhabitants.

All the resentfulness of an idealist whose ancestry was steeped in liberty of action rose to a fury at this unwarrantable interference of war with the lives of men—a fury maddened by his feeling of utter impotence. Was it possible, he argued, that a group of men drunk with pomp and lust of conquest could wreck the whole fabric of civilisation? What of science and education? Had they risen only to be the playthings of madmen? What kind of a world was it that allowed such things?

Was it possible, however, that this war was different from any other? Granted that Austria had willed the crushing of Serbia, and that Germany was instigator of the crime—had not the rest of the world proved false to their creeds by allowing the war-hunger of the Central Powers to achieve its aim? Supposing France, Britain, America, and Italy had joined in an immediate warning to Germany and Austria that if they

did not desist from their malpractices the area of their countries would be declared a plague-spot, commercial intercourse with the outside world at an end, and their citizens treated as lepers. If that had been done, men could have gone on leading the lives to which they had been called, and by sheer cumulative effect could have exerted a moral pressure on the war-lust of Germany that would have been irresistible.

Yet, like a bull that sees red, the nations had rushed madly at each other, thirsting to gore each other's vitals with their horns. Men of peaceful vocations were at that very moment slaughtering their brother-men. It was wrong—hideously wrong!

And the charge of responsibility could not be laid at the door of those idiots of Emperors. . . . Their crime was evil enough, but the responsibility for war was with the people who allowed themselves to be led to murder by a mad, jingoistic patriotism. Supposing that when Europe was mobilising the people of Great Britain had sent a message to the Germans: 'Brothers, justice must be done and malefactors punished. Fearing nothing but the universal conscience, we refuse to fight with you, but demand in humanity's name that you join with us in establishing the permanent supremacy of Right.' Some such message as that coming from a Power steeped in a great past would have been ashes to smother the smouldering flames of world-war.

But there was no machinery for such a thing. There was no method by which the great heart of one country could speak with that of another. Our obsolete diplomatic envoys, the errand-boys of international politics, were mere artifices, tending to cement rather than to dispel the mutual distrust of nations. What, then, stood in the way of world-understanding? What was the cause of the blindness which permitted men to be led like dumb cattle to the slaughter?

Ignorance.

That was the answer to it all. It was ignorance that kept a nation unaware of its own highest destiny; it was ignorance that fomented trouble among the peoples of the earth. Suffering, sickness, crime, tyranny, war, were all growths whose roots were buried in ignorance and sucked its vile nourishment.

An impetuous wave of loyalty towards his own country swept over Austin Selwyn at the thought. Other peoples had declared war on each other: America by her silence had declared war on Ignorance. He felt a sudden shame for his previous doubts. He saw clearly that his great continent-country was a rock to which the other baffled, despairing nations might cling when disaster overtook them.

And as he was joined by Elise Durwent, the American swore an eternal oath of vengeance against Ignorance.

(Continued on page 227.)

THE PTARMIGAN.

By SETON GORDON, F.Z.S., M.B.O.U.

I.

THERE is no bird that clings so tenaciously to the high hills, summer and winter, as does the ptarmigan.*

In summer its home is a nesting-site for the dotterel, and to a lesser extent the dunlin and the golden plover; but as autumn approaches these visitors betake themselves to the coast, and the ptarmigan have the high tops to themselves.

The golden eagle, in his magnificent flight, frequently passes over the land of the ptarmigan, and the snow bunting is often in the high corries, but these birds make their homes in the sheltered glens during wild and stormy weather, whereas ptarmigan never, under any circumstances, visit the low country. A further interesting point about the ptarmigan is that it possesses the peculiarity—unique among British birds—of assuming a completely white plumage during the winter months, in order to harmonise with the snow that covers the high hills from November till early May.

The most suitable season of the year to study the ptarmigan is during the early summer, when the winter's snows are fast disappearing from the high corries. During the first days of May the hills are often covered with a greater depth of snow than at any time during the winter, but a sudden spell of warm breezes and bright sunshine rapidly melts the snowy covering, and the hill plants quickly respond to the welcome warmth. It is then that the ptarmigan set about searching for a nesting-site—for the birds, notwithstanding the snow, pair early in the spring—and before May is over the majority of the hens are brooding on their full complement of eggs.

During the summer of 1919 ptarmigan were earlier in nesting than ever I can remember, for, after frost and snow up to the first week of May, that month was subsequently exceptionally fine and warm, and all bird-life on the high hills was in early June a full week more forward than usual.

During a fortnight in June (commencing on the 14th of that month) spent on the high hills, I did not see a single ptarmigan's nest still containing eggs; while on the 17th of June I came across a dotterel with her young brood, although during previous seasons I had never known of this bird hatching off her eggs before June 22.

Unfortunately for all bird-life on the highest grounds, the weather at the time of hatching,

and for a full fortnight subsequently, was exceedingly stormy, with constant gales and storms of rain and, latterly, snow. On June 26, when on the high slopes of Braeriach, I found a couple of inches of snow, and hard frost prevailing. At one point, not far short of 4000 feet, I accidentally disturbed a hen-ptarmigan brooding her two chicks in the snow, and very cold and dejected did the youngsters appear as they ran cheeping over the snowy ground.

A little earlier in the day I had come across a mother 'tarmachan' who had taken her brood to rocky ground—an unusual situation in which to find young ptarmigan—in order, I imagine, to shelter them from the storm. There is no doubt that many of the ptarmigan lost a portion at any rate of their broods during this stormy period, for I came upon one hen-ptarmigan brooding only a single chick, instead of the seven or eight she should rightfully have had. On the lower ptarmigan hills, as, for instance, the Monadh Liadh Mountains to the north of the Spey, the storm was not so severe, and an unusually large stock of ptarmigan were on the ground during the autumn of last year.

The nest of the ptarmigan is a hollow scraped among the mosses and the lichens—ptarmigan normally nest above the heather line—usually sheltered by a stone and frequently beside a small burn, at a height of from a little over 2000 to just under 4000 feet above sea-level. Though the birds, both old and young, are frequently seen above the latter height on the Cairngorm Hills, I have never seen a nest higher than about 3700 feet. The eggs in size and shape closely resemble those of the red grouse, though the blotches which thickly cover them are often of a brighter red than those on the eggs of the grouse. A full clutch generally numbers from six to eight.

During the time that the hen-bird is sitting the cock-ptarmigan takes up his position at some point from which he has a good view of the surrounding hillside, and at the approach of the human intruder rises with snorting croak, flying a short distance, and then, with more croakings, alighting and watching anxiously the source of alarm. The hen in the meanwhile is sitting very close on her eggs, and does not leave them unless absolutely obliged to do so. Indeed, I have on several occasions photographed a sitting ptarmigan on her nest at a distance of less than six feet. The young when hatched resemble their surroundings very closely, and crouch on the ground when in danger. The mother-bird in the meantime drags herself along the ground, feigning injury, in order to draw one from the neighbourhood of her chicks.

* In the Gaelic this word is written *tarmachan*, and may be derived from *tarmach*, to be the source of. The letter p in the English spelling of the word is said to have a French origin, and seems superfluous.

By August the young are strong on the wing, but are not full-grown until the end of that month, often considerably later.

The ptarmigan's life is rendered a burden to it by the golden eagle. I have rarely been out on the high hills without seeing the eagle hunting ptarmigan. During the first days of October 1919 I was crossing the Larig Ghruamach Pass, which connects Braemar with the valley of the Spey, and when I had reached the neighbourhood of the Pools of Dee I noticed great commotion in the ptarmigan world. A large pack of these birds came hurrying through the pass towards the north. Half a gale of south wind was blowing behind them, and they were travelling at express speed. Very beautiful did they look as they passed me, their white wings standing out sharply against the dark rocks of the hillside behind. When almost opposite me they alighted for a second, but fear again spurred them forward, and now I saw, sailing through the Larig behind them, the dark form of an eagle. The eagle, from his plumage, was a bird of the year, and as he soared downwind his flight at times was somewhat shaky. Some distance beyond me he dropped to the ground, but was too far off for me to see whether or not he had captured a ptarmigan. Shortly afterwards the mist came down, but about an hour later I saw the eagle beating up the Larig against the wind, and making for the Dee side of the pass, whence he had originally come.

In October ptarmigan are in a transition stage of plumage, and during the past autumn I noticed for the first time the curious effect thick mist, coupled with a fall of snow on the ground, has on the appearance of these birds when they take wing. The white wings, being of the same colour as the snow, are invisible in the mist, and the ptarmigan appears as though flying with its wing-stumps alone. The autumn of 1919 was

an exceptionally severe one on the high hills. As early as September there were heavy snowfalls, and the hills were deep in snow almost continuously in October. At the end of the latter month I had a fine view of a covey of ptarmigan in a remote corrie much frequented by these birds in winter. They were busy feeding on the young shoots of the ling and the crowberry, and were very tame. Two of their number had already assumed full winter plumage of pure white, while the rest were in varying stages of transition. It was interesting to watch them running along the snow, which was frozen sufficiently hard to bear their weight. Having reached what they considered a safe distance from the human intruder, they rested, some of the birds sitting on the snow, while others stood about on rocks, with their weather-eye open for danger. They were joined by a ptarmigan from the far side of the corrie, the bird as he alighted uttering a series of high-pitched yelping sounds quite unlike anything I have ever heard a ptarmigan use before—the cry of the cock-ptarmigan being a deep snorting croak.

On one occasion recently I saw footprints of a ptarmigan in the snow 4000 feet up, but during the winter months the birds are rarely met with on the summit plateaus of the Cairngorm Hills, where lie large stretches of land just touching, or closely approaching, the 4000-foot level.

It says much for the severity of the past autumn that on November 6 I saw about a dozen ptarmigan in the snow on the roadside on the well-known Cairnwell Hill, which sees thousands of cars make the trip from Perth to Braemar and *vice versa* during the summer months. The highest point of the road is 2200 feet above sea-level, but the bend at which I saw the ptarmigan is little over 1800 feet up, an unusually low elevation at which to find the 'white grouse' in the Central Highlands.

THE PROSPECTOR OF PILOT MOUNTAIN.

By G. TREVOR ROLLER.

I.

UP by Pilot Mountain near the Cœur des Laines travelling is hard. When the snow is down—five feet deep, perhaps—it's a job for snow-shoes, and it's biting cold. But prospectors don't range the mountains at that season, for they must see the ground and watch it for the outcrop, the rock that points the way to riches—or does not, as the case may be. No; the prospector sets forth in the late spring when the snow has gone, giving place to brambles and fallen trees, great giants of the pine belt, tamarack, spruce, and fir. Hard going this—impossible for a horse, sweating work for a man.

So our prospector found it as he scrambled

and climbed over the fallen trunks, while their living fellows towered about him, blocking his view.

No easy thing to steer a straight course through the pine-clad mountains, but the prospector did it by the occasional glimpse of the sun, a rarer consultation with a small compass—a trumpery thing that hung from his watch-chain, but it told the north, more or less. Soon he would come to the end of the saddle on which he was travelling, and the ground would slope rapidly down to a gulch that should lie at the foot of Pilot Mountain. He must cross the gulch and struggle on as far as possible, even in the dark, until, in fact, he was too dead-beat to go farther.

For the prospector was racing against time—and also hunger. Only one small tin of corned beef remained in his blanket-pack, the pack that seemed so light at the morning start, and grew so heavy as the day wore on, till his shoulders ached with the pressure and the straps cut into his flesh. Just one tin, three biscuits, and five days' hard trekking! He was racing for the Crowsfoot Indian Reservation, with a sound body, a tin of beef—enough for one good meal—and a will to win.

He never doubted his ability to 'make it'; he only cursed the necessity of having to. It all dated back to that rotten rifle-sling and the Blackwater River—the river of which no man must drink. He had crossed it astride a great log that had taken stupendous efforts to roll to the water. He had placed his pack and his boots before him on the log, sat astride it, and paddled with his naked feet. The pack slipped, and in his struggles to hold it on the rifle must have caught in a branch stub on the log. Anyway, the sling parted and the rifle sank to the bottom of the river. Half a day he wasted diving and dragging for it, but it would have been no waste had he found it. A man let loose in the western wilderness without a rifle is a man bereft entirely of food, a man who must make for the nearest civilisation; and well he knew it. He was then ten days or so from the approximate possibility of succour. He had gone half the journey; and his small stock of canned stuff had dwindled down to one small tin.

How he cursed the loss! For with his rifle he would have been so independent, able to shoot all those gulches and side-hills and probe the hidden secrets of the mountains. As it was, he dared hardly look about him for fear of catching sight of an outcrop that would delay him, so much was his stomach his master.

II.

The light was already failing him, but he tramped on, shoulders bowed with the weight of the pack, circumventing fallen timber here, dodging boulders there, sometimes catching his shins in the long brambles that crossed his line of march; and as there were none to hear, he swore foully as the thorns pricked him through his blue canvas jeans. But he was making good time, all things considered. Soon he reached the end of the saddle, and from here he could look across the darkening gully to the still sunlit Pilot.

It was going to be a bad climb down into that darkness; bad, possibly dangerous. He had done these things before; the thought of danger seldom occurred to him. He would have the creek to cross, and with the spring rains it might be swollen. The ascent would be worse, for he meant to strike over the western side of the mountain.

He paused, hiking the pack higher on to his shoulder-blades, took out a small slab of chewing-

tobacco from his hip-pocket, bit off a chunk, and murmured, 'Hell!'

He had a full view of the task, or, rather, a bit of the task, set him, and although not fearing it, he hated to have to do it. He was in the cursing vein as he again humped his pack and started, tired but alert, footing down the slope. Soon he struck boulders, then detached rocks springing from the ground like stepping-stones. Nimbly he stepped them, but the shadows were deceptive, and again he paused.

'I must come back to this,' he thought. 'There might be an outcrop here. Dolgarn the light! but I'd better make good that creek.' And on he went, still stepping gingerly.

Presently he heard the water below him splashing and gurgling. This was a good sign, for had the creek been full it would have flowed high up on its rocky banks, missing, or, rather, covering and making one deep stream of, the miniature waterfalls that gave out the pleasant splashing. So encouraged, he quickened up. He reached a large flat rock at the edge of the creek. Three feet from the edge another loomed darkly. He gave a slight spring on to it and—no! not missed—he had jumped at a shadow simply, and fell.

The wind was knocked out of him, and he lay face down with the pack still heavy on his shoulders, his arms outstretched. For some moments he lay thus, while the creek babbled merrily within a few feet of him. He bent his elbows, placing his palms on the ground to raise himself, but at the first effort his right thigh gave him excruciating pain. 'I've strained a muscle,' he thought.

Quickly he loosened the pack-strap, and the load rolled to his side. Then he turned on to his back, the movement costing him agony. He wondered dully if it could mean a broken leg—something had struck him as he fell. Carefully he felt down his right leg with his two hands. The knee seemed close to his body; there was an extraordinary lump on the outside of his thigh. He tried for a moment to bluff himself that it was only muscle cramp, but only for a moment, for he knew it was a break. So he lay back and wondered at the ways of God that had allowed him to break his leg when his neck would have made so much better a job of it!

III.

But while there is life there is hope. Hope cheered him—he might be found. Probably nobody had passed this spot for years—if ever; possibly no one would pass again for years. And yet there was a ten thousand to one chance of another prospector like himself, or an Indian trailing deer—what a fool he was: no deer-hunting at this time of year!—still some one; but it was an absurd, devilish outside chance.

Immediate action occurred to him—first-aid. What had he read? 'Make splints out of

butts of fishing-rods, baseball-bats, golf-clubs; bind to the limb,' &c. He looked round and saw no golf-clubs, only pine-trees, and they would have to be felled; so he laughed—grimly, but the laugh came.

Gently he got his pack to him and released his blankets. With one he arranged a pillow under the leg. It was a struggle, but the result was good. Another he spread over him; the third would serve as a pillow for his head. A hard man, he could lie on a hard bed. The tin of beef appeared in a gunny sack with the three biscuits. What nonsense it all seemed—food, and death at his elbow! But he was devilish tired. He was almost comfortable. He ate a biscuit. His left hand while feeling round—it was quite dark now—came in contact with water, a pool of it; he found his tin mug, and drank greedily.

He was in pain, but nothing so damnable as he thought it should be; surely a broken leg should hurt more than this! He would try to move again, just to prove it was not broken. He pulled the blanket up to his neck and endeavoured to raise his right knee. As the broken ends of bone grated against each other, he fainted. Fit, strong man that he was, he went off like a vapouring girl, and the best thing for him, too. He was dog-tired; the night was warm; his blanket was well up to his neck. The faint turned to a healthy sleep.

IV.

Later he woke; it could not have been midnight. Like most men who live the outdoor roaming life, he was fully awake in a flash; in a flash everything came back to him. He felt his leg. It was much swollen. It pained him dully and constantly, but not greatly. He wished he could get his boot off, but dared not move enough to try. He lit a pipe, gazed up at the stars, and tried to think.

Surely the one chance in ten thousand would turn up and beat Fate! It seemed so futile that he, in his strength and the very prime of life, should be cut off in this fool way. Death! Well, it had never frightened him—only the pain of death was a worry; but then he was in no great pain. Starvation meant getting weaker and weaker till sleep, and subsequently death, overtook him. He was not hungry at the moment, so he thought death by starvation none so bad. Then suddenly the thought of death made him angry—the thought that he must die before the fulfilment of what he took to be a direct promise from the Almighty. Surely he had been meant to find what he was firmly convinced was his lodestar. The lodestar which every spring for years past had attracted him irresistibly out on to the mountains, and kept him there till the first snows warned him that for that year, anyway, his search was over. Then he would return to work out his winter in mining-camps,

making enough to finance his spring setting-forth, and to provide for his wife during those long summer months. He had scarcely considered her—save in the matter of money; that spring call to the mountains was too strong on him. Even in the first year of his married life he had left her, reluctantly; but still he had gone, searching for what he knew lay hidden. Year after year he had prospected for gold. Small indications had encouraged him. Once in his search for gold he had stumbled on copper. He had staked his claim, assessed it, then leased it; the money that came from this he spent on his wife and on furnishing their home. He had bought a valuable piano neither of them could play, and a two hundred dollar gramophone that they were both heartily sick of in a month.

He thought of his back life. He had not been a bad man as Western miners go. In his youth he had known the insides of saloons and dance-halls. Well, better men than he had cut loose as colts, as young men will. He was even religious in a crude way; he believed in a God that had hidden a treasure in the mountains and had bidden him go seek it. But why in thunder, after all these years, had God let him down? There must have been a reason—he wished he knew it. He tried to think of all his sins. Long-past sins, yes; but lately what had he done? Neglected his wife? Well, it was a means to an end. One day she was to have been a rich man's wife; now it would be months before she could know of his death—if ever she did know for certain. In the meanwhile—heavens above, how long did it take a man to starve? Suddenly a fury of mad rage seized him. Why should he prolong the agony? He hunted feverishly for his knife to end it all. He could not find it. His hand came in contact with the gunny sack. At least he could hurry starvation. He threw the sack far from him. Then in a panic he realised what he had done. He rolled to his side and tried to drag himself after it.

The ghastly pain sobered him. He lay back, opening and clenching his hands, the sweat pouring down his face. What a fool he had been! With one throw he had added more odds to his ten thousand to one chance. Still sweating, he lay, while the pain in his leg numbed, and listened to the sounds of the forest going on round him, the whispering of the breeze in the pine-tops, the gurgle of the creek, and occasionally some slight rustling in the undergrowth that told of a night marauder. Hundreds of times he had lain hearing those sounds but never realising them, for he was no dreaming poet, merely a hard man treating himself hardly. But to-night he listened and wondered vaguely at the beauty of those sounds. They comforted him, and he grew drowsy; gradually he dropped off to sleep, wrapped in the mother-arms of nature.

V.

Men who sleep often in the open learn to wake when the sun's rays touch them; it, the sun, is the alarm-clock of woodcraft. Instinctively the prospector turned his face to the east. The very first beam of sunlight that came streaming down the gulch lit on his face; his eyes opened, and he lay blinking. For the first time in his life in the open he did not throw his blankets from him, stretch and yawn, jump up and bathe his face in the nearest water. No; he was a fixture, and knew it; the pain—returned now—warned him. Slowly and painfully he twisted his shoulders and head to get away from the glare, twisted till he lay staring at the rock from which he had fallen, a few feet from him, almost within reach. He stared at it a while; then he rubbed his eyes and stared again. Suddenly, forgetful of pain, he raised himself on his elbows, his eyes nearly starting from his head—and saw at last what he had spent all these years in seeking. The real thing! Not just pay quartz, but free gold running in a seam right down the rock, with the morning sun making the dull red sparkle. Free gold; every foot a fortune. Quickly he looked round the fast lighting scenery. All about him teemed with blatant indications; the creek itself must be a very placer mine, the whole place more wonderful than he had ever dreamt or read of. No! he was too cunning at his job; he couldn't be mistaken. What a spot for a mine, too! Down this side of the creek he would blaze his first claim, then on the other; next he would register, and the rush would come; he would dam the stream and make his water-power to run his mine. First the free gold and the placer, then sink and mine. Glory be, but this was his—his mine, his find; his to work

and make and lease, his to do what he liked with! His to—die on! The thought struck him like a physical blow, and he lay back panting. He had found what he had set out to find, right at the damnable end. Then he laughed, laughed senselessly, peal after peal; the irony, the rottenness, the sin of dying on top of a fortune—oh, fifty fortunes!

No white man had ever been here before, unless he had been blind or mad. This made his chance out to about a million to one.

Then delirium seized him, and all through the hot day the sun beat down and he raved. As night came his strength broke, and he fell into a coma. The last thing he did was to pull the blanket up to his neck with the instinct of keeping warm.

Next morning the rising sun touched the still form, but there was no awakening.

VI.

Extract from the *Butte Herald*:

'SIDNEY K. HERD AND HIS PROSPECTING-PARTY STRIKE A PAY STREAK. GOOD BOY, SID! UP NEAR THE CŒUR DES LAINES, A FREE GOLD PROPOSITION. THEY HAD TO TRAVEL SOME TO FIND IT.'

Here comes half a column on the locality and news of the property, ending thus:

'Immediately on the discovery of the gold another and very gruesome discovery was made. Just near the largest outcrop of all the party came upon the remains of what must once have been a white man—decayed bones and rusty metal buttons. A tarnished silver watch and chain were also found. A few feet away lay a rusty can of meat. This had not been opened, which points to the surmise that the man had not died of starvation. Could it have been a case of foul play? The tragedy has lain there for many years, and never until now come to light.'

THE PLANT-WIZARD OF AMERICA: LUTHER BURBANK.

PART I.

EVEN though we have never travelled abroad, we all know from pictures and photographs the appearance of those strange spine-covered plants which go by the popular name of prickly pears, but are really a species of cactus. In the American deserts of the West they grow in abundance, but though their thick and succulent stems, containing about 60 or 70 per cent. of water, form a nutritious food for cattle, the fact that they are covered with sharp spines renders them of very little use. In Arizona, during the great drought of 1903-4, cattle suffered severely for want of food and drink, and by utilising a gasoline-burner to singe off the spines, many hundreds of tons of cacti were made available for fodder to tide over the trying time. Singe-

ing, however, was a slow and costly process, and unpractical save as an emergency measure.

For many years men have been puzzled over the problem of the cactus. Here, in a region of drought and desert, where it is difficult to bring up food and fodder from the haunts of men, grows a plant that provides all that is needed to sustain and maintain large herds of cattle; and yet, because of its terrible spines, the plant is practically useless. Only those who have travelled in the native home of the prickly pear can realise the inconveniences and dangers that arise from these spines. There are a thousand species of cactus in the American South-West, and the names the desert men give them are sufficiently indicative of their char-

acter—'the never-fail sticker,' 'the stick and stay in,' 'the stick through anything,' 'the big sticker,' 'the little sticker,' 'the deep sticker,' and so on.

The American scientist, Dr Veatch, has given an account of his experiences with cacti when journeying through San Felipe Pass. His horse became irritated by the prickly plants and began to plunge, whereupon the traveller threw himself off, and was dragged through the cacti until his clothes, to use his own words, 'were literally pinned to the flesh from head to foot by the barbed needle-like prickles.' No wonder the stockmen who have to ride among these porcupines of the vegetable world see that their stirrups are well cased-in with stout leather.

Now, one man who had thought much on this subject determined that he would create a new cactus which should have all the virtues of the old prickly pear with none of its vices. In other words, he would breed a cactus without spines; and after numerous experiments he did so, with the result that now, in many of the American desert and drought lands which formerly were closed to cattle, large herds can be kept, and find their food and drink in the spineless cactus. The man who achieved this marvel was Luther Burbank, and he has earned for himself the by no means exaggerated title of 'the plant-wizard,' while one of the state legislatures of America has set aside his birthday as an annual holiday, to be called Burbank Day.

In many ways Luther Burbank is one of the most remarkable men living. There is no one quite like him in the Old World, and while his name is a household word on the other side of the Atlantic, and is honoured by scientists everywhere, he is almost unknown by the general mass of people in this country. Luther Burbank has literally created new plants. Let there be no misunderstanding about this. He has not merely produced by cross-fertilisation freaks that have died and been done with; he has put into the world absolutely new fruits and flowers and vegetables that breed true and go on propagating their species, as though they had been in existence for countless generations. Those that appeal to the imagination and the lay mind are not, of course, the most wonderful from the scientific point of view, but a few of his creations may be mentioned. There are the spineless cactus (already referred to), the white blackberry, the stoneless plum, the plumcot (a cross between the plum and the apricot), the scented dahlia, the blue poppy, the dwarf chestnut-tree, the thornless blackberry, the winter rhubarb, the paper-shell walnut, and the sunberry. A brief description of some of these, and an account of Luther Burbank's work, may not be uninteresting.

Even as a youth he was fond of experimenting in plant culture, and his first success was with

a potato which has since become famous as the Burbank Potato, and of which it is estimated that some £4,000,000 worth have been raised in the United States alone. The potato-plant does not usually produce seed, but young Burbank one day saw a plant with a seed-cluster containing twenty-three seeds. He saved this through the winter, and planted the seeds separately in the following spring. To his surprise, no two seeds produced the same kinds of potatoes; but one yielded tubers of an exceptional size and whiteness, and these he saved and planted the next year. Finding that they reproduced their fine qualities, he sold the potato to a nurseryman, and received for it in all thirty pounds, which enabled him to travel from his home in Massachusetts across the continent to California, where he had decided to carry on his experimental work under the most favourable weather conditions that the world could provide.

The development of the spineless cactus, in many ways the most dramatic of Luther Burbank's triumphs, was brought about only as the result of a long series of experiments extending over ten years. By selecting those plants that had the fewest and shortest spines, he hoped eventually to eliminate the prickles altogether; but for a long time it looked as though he would fail. The spines persisted, till at last one happy day he found in his garden a cactus eight feet high, with thick, fleshy leaves a foot long, and not a single thorn. It was a thrilling moment, but not the final triumph, for it yet remained to be seen whether the spineless cactus would breed true. Fortunately the species was fixed, and now tens of thousands of acres of wilderness produce crops of this rich cattle-food, so that what was once useless desert-land is now able to support large ranches of cattle; and, further, the luscious fruits of the spineless cactus form a welcome food for man. Burbank, as an admirer has put it, 'at one stroke rid the world of a plant enemy and gave it a new plant friend.' The cactus will grow where no other plant can thrive. It needs no rain, and millions of acres that have hitherto been bare and uninhabited may, by this wonderful creation, before long be supporting mighty herds of cattle and teeming populations of men. Burbank himself says: 'The population of the globe may be doubled, and yet in the immediate food of the cactus-plant itself, and in the food-animals which may be raised upon it, there would still be enough for all.'

With the plum Luther Burbank has done wonders, producing more than sixty new varieties that include and emphasise every possible good quality. Some varieties ripen at midsummer, others have an exceptional percentage of sugar, and others again have different flavours, such as those of the apple, the Bartlett pear, and so on. Then there are plums with a very thin skin, others with a red flesh; but the most striking

wonder of all is the plum without a stone. Burbank took a small, ill-flavoured European plum, not much larger than a cranberry, which had a very small, light stone, and crossed it with the rich American varieties until at last he produced a beautiful, luscious plum that could be bitten right through like a strawberry.

By crossing the plum and the apricot he produced an absolutely new type of orchard fruit, the plumcot, which has the virtues of both its ancestors. It is delicious in flavour and most attractive in appearance; but those who see and taste it have little idea of the years of almost superhuman patience that were needed to create the fruit and render it fertile, so that it would breed true.

The hardy Winter Rhubarb, with enormous juicy stalks, has been developed in the same patient manner from a poor New Zealand plant with a stem no thicker than an ordinary black-lead pencil. Luther Burbank wanted to find a rhubarb that would bear during the winter months when ordinary rhubarbs are dormant. He therefore introduced this variety from New Zealand, where summer reigns at the northern hemisphere's period of winter, and by selection he adjusted it to the North American winter, at the same time developing the size and flavour of the stalks.

Another miracle of this incredible plant-wizard is the dwarf chestnut. In the ordinary way we have to climb up to gather chestnuts, but Luther Burbank will ask you to stoop down and pick them from little bush-trees only two or three feet high. Thirty-five years ago he began his experiments with a score or so of giant chestnuts gathered from trees in Japan. These he grew and crossed with American chestnuts to improve the size and flavour of the fruit. Next he worked along another line to speed up the earliest date of bearing, and by also reducing the size of the tree he at last produced a type of chestnut-tree that, were it not a fact, would seem an utter impossibility. Within six months of the time that the nut is planted the dwarf tree is actually bearing a crop of fine large chestnuts. Luther Burbank has not yet finished with this fruit, for he is still working at it, combining and emphasising the best properties of nuts from three continents, America, Europe, and Asia, and endeavouring even further to improve the size, the flavour, and the bearing capabilities, while at the same time producing a smooth burr.

In a similar manner by selection and cross-breeding he has developed or created a blackberry without thorns, an orange without pips, a gooseberry without hairs, and a walnut with a shell like paper. The story of the last-named is extremely interesting. The wizard set out to eliminate the nut-crackers, but after breeding the walnut-shell down to a substance so thin that it could easily be bitten through like a skin, he found that the kernel now had no protection

from birds, which used to peck through the thin shell and eat the nut. It was necessary, therefore, to continue the experiments in the opposite direction, and thicken up the shell again till it was able to resist the efforts of the birds. The final result, while successful in this direction, has a shell so thin that it can easily be crushed between a lady's fingers.

Another wonder was wrought by Luther Burbank when he combined the peach and the almond, and in the second generation secured hybrids that bore fruits which were delicious peaches, yet had inside not the ordinary stone, but an almond-nut with the proper shell and kernel. Here were two fruits literally growing in one. The sunberry, another of Burbank's creations, is in some ways the most interesting of his productions, for this useful and delicious fruit was obtained by crossing two species of *solanum* or nightshade, neither of which bears a fruit that is edible. One nightshade is a native of Africa, and the other of America. For twenty-five years Burbank tried to hybridise these two plants, but it seemed as though all his efforts must end in failure, when at last on one plant a single berry was produced. How carefully the wizard watched over this precious fruit until it had ripened, and how jealously he guarded the seeds until he planted them and they grew up! He had scored a great triumph, and one of the seeds from that solitary berry, that took a quarter of a century to produce, became the ancestor of an entirely new race of fruits, now very popular in America.

Luther Burbank is not anxious to perform horticultural tricks, and has no desire to pose as a miracle-worker for the bewilderment or admiration of the spectator. He has, in the course of his operations, evolved extraordinary freaks, such as a potato-plant grafted on the roots of a tomato vine and producing aerial tubers. This, however, is merely an interesting anomaly. Luther Burbank's ambition is something much greater than that of the successful conjurer—his sole object in life is to enrich the world with new and improved food-plants of real value.

(Continued on page 237.)

TRANQUILLITY.

ALWAYS the peace above the unquiet heart—

The peace of dawn against night's brooding wing,
The dew-ponds on the downs that lie apart,
Like shining jewels in an emerald ring.

Dim shadowy aisles, formed by o'erarching trees,
Still water touched by a mysterious dream,
Ripe cornfields ruffled by a wandering breeze,
Or stirred to life by a red sunset gleam.

Gray waves that lap a vast and lonely shore,
And birds that softly sing and sleep apart,
Stars watching in the silence evermore—
Always the peace above the unquiet heart.

G. R. GLASGOW.

Chambers's Journal

SEVENTH SERIES

LEAVES FROM A CATALOGUER'S WALLET.

III.—A GAINSBOROUGH MASTERPIECE.

By W. ROBERTS.

I.

IN 1785-86 Mr Gainsborough, as we gather from the scrappy bits of art news which found their way into the newspapers of the day, was painting the whole-length portrait of a beautiful woman, who had a few months previously married a well-known baronet, a descendant of a duke of ancient lineage. She herself was the daughter of a right reverend dean who, among his other distinctions, was chaplain-in-ordinary to George III. The progress of the portrait was watched with interest by the many friends of the lady and of the artist—it was 'daily awakening into perfection with all the external grace and elegance of nature.' It was not exhibited at the Royal Academy, for the artist had quarrelled with his fellow-academicians, and ceased to exhibit after 1783. The portrait, when finished, was sent to its home in Lincolnshire, and was never seen by the public until it was lent to an exhibition in London three-quarters of a century afterwards. Probably it was this very portrait which inspired the stanzas, 'On Viewing a Portrait of a Lady painted by Gainsborough,' dated 4th May 1786, which a Mr Herbert of Grosvenor Street contributed to the 'poets' corner' of one of the newspapers. Only two verses need be quoted here:

Sure magic lies within that art,
Which thus reflects the lovely dame!
Her eyes the pointed lightning dart;
Another form—and yet the same!

Here will I worship, here adore,
For here I trace an angel too;
The beams that warmed the heart before
By spells enforc'd—what will they do?

The husband of the lady—for convenience's sake we will call him Sir Robert Doncaster—lived until 1815, but his widow survived him for twenty years, dying just half a century after she was painted by Gainsborough. In the portrait the artist employed his favourite combination of grayish-white and sky-blue. It shows her walking in a summer landscape which helps us to realise the truth of Ruskin's contention that Gainsborough was the greatest colourist since Rubens—'pure in his English feeling, profound in his seriousness, graceful in his gaiety.'

NO. 485.—VOL. X.

[All Rights Reserved.]

She is in a blue-and-white dress; her left hand supports a scarf, her right hangs down by her side. In looking at this superb portrait, so characteristic of Gainsborough, so typical of English high-born female beauty, and so graceful in the elegance of its pose, one thinks of Peter Pindar's famous apostrophe to Time in favour of another of Gainsborough's famous models, the Duchess of Devonshire:

Hurt not the form that all admire—

Oh, never with white hairs her temple sprinkle—
Oh, sacred be her cheek, her lip, her bloom,
And do not, in a lovely dimple's room,

Place a hard mortifying wrinkle.

But, alas for all apostrophes and appeals to Time, age creeps on, beauty fades, and the gracious belle of one generation becomes the wrinkled, despotic, and querulous old lady of another!

II.

The great success at the Grosvenor Gallery, London, of the loan exhibition of Sir Joshua Reynolds's works in 1883-84 was naturally followed the next season by one of Gainsborough's. Shortly before the exhibition opened it was reported that certain practically unknown portraits of the finest quality had been secured. There was much turning over of peerages and the like by picture-dealers to find out, so far as such books can indicate, the status of the apparent owners, and judge if they could be approached in the matter of a 'deal.' A wealthy and excellent member of the trade, Mr Joseph Moses, remembered having seen the superb portrait of Lady Doncaster when it was lent to an exhibition some twenty years previously. Mr Moses determined to purchase the Lady Doncaster *coûte que coûte*. He wrote to the owner, a collateral descendant, a polite and diplomatic little note to say that, as he was running down to the races—which he abhorred, by the way—in a few days he would do himself the pleasure of calling on Sir Robert Doncaster, as he had a little proposition to set before him. The Gainsborough exhibition had opened a day or two before, and such a display of the work of the great English artist had never been witnessed. The newspapers had printed columns about the beautiful portraits, and it was impossible to ignore the

MARCH 13, 1920.

fact that the Lady Doncaster was one of the triumphs of the exhibition.

Mr Moses drove up to the stately mansion with hope in his heart and his cheque-book in his pocket. He was duly announced and courteously received; but he was somewhat nonplussed by the baronet's cheery and almost boisterous exclamation, 'Ah, Mr Moses, I suppose you have come to try to buy the portrait of my dear old grand-aunt?' Floored for a moment by this unexpected divination of the real object of his visit, Mr Moses quickly recovered himself, and answered, 'Sir Robert, if you had made any other guess you would have been wrong.' This might well have ended the interview, but Sir Robert was the pink of courtesy; he assured his visitor, with tears in his eyes, that he would never think of parting with the portrait of his dear old grand-aunt, and was grievously hurt at the suggestion of such a thing. But, as his visitor had come a long journey, he must join the family in a cup of tea. Tea was not what Mr Moses wanted—it was poison to him; but he was tactful and self-sacrificing. The afternoon passed pleasantly, and Mr Moses was conducted to his carriage by the family, and departed—not to the races, but to London, with the firm conviction in his mind that the baronet was not going to sell his dear old grand-aunt.

III.

The Gainsborough exhibition was prolonged into the summer, attracting great crowds of dealers who wanted to buy, of collectors who came to admire and envy, and of students who came to study the works of the famous artist. Now and then when in town Sir Robert would drop in at Mr Moses's beautiful galleries in Bond Street for a gossip and a cigar; they discussed politics, social questions, and other matters, but by a sort of mutual understanding the delicate subject of the dear old grand-aunt was not mentioned, or there would have been more tears and more protests. Summer came along, and Sir Robert—who never forgot the motto of his family, '*Comiter sed fortiter*'—dropped the hint that, as usual, he was going to Homburg to take the 'cure.' This was something in the nature of a bombshell. Mr Moses, like his father before him, had found the air of Margate and the produce of Kentish hops a sufficient 'cure' for all his ailments; but there loomed up in his imagination the possibility of other rival picture-dealers taking their 'cure' at Homburg, and tempting Sir Robert with offers for the portrait of his dear old grand-aunt. This possibility became an obsession, and Mr Moses determined that Sir Robert should not fall into other hands if he could help it. And so it came about that the two worthies eventually found themselves housed in the same hotel and drinking the same nauseous waters. Once only was the matter of the picture broached, and that was when Sir Robert

had swallowed an extra dose of the waters; he then asked, almost in spite of himself, 'Mr Moses, if I ever felt disposed to part with my dear old grand-aunt's picture, what would you be inclined to give for it?' Mr Moses had a sudden thrill; he felt that things were moving in the right direction; but his reply was restrained—he simply said, 'Sir Robert, *when* you have decided to part with it I will make you a handsome offer.'

Both in due course, having taken the 'cure' and swallowed enough water to make them ill whenever Homburg was mentioned, found their way back to London. The Gainsborough exhibition was drawing to an end, when the pictures would return to their respective homes. One day before the close Lady Doncaster strolled into Mr Moses's gallery and casually mentioned that, as their country-house was in the hands of the painters and decorators, Sir Robert would take it as a personal favour if Mr Moses would receive the Gainsborough portrait and store it until it was safe for it to be sent to Lincolnshire. The permission was readily granted, and again Mr Moses felt that things were moving. He inquired after Sir Robert's health and whereabouts. Lady Doncaster informed him that her husband was staying at a certain hotel at Brighton whilst their own house was being put in order, and that she was going down to join him by the 3.40 express. Mr Moses suddenly recollected that Brighton air always did him a lot of good, and he informed Lady Doncaster that he thought he would run down by the same train for a day or two.

IV.

The 3.40 express carried Mr Moses down to Brighton, but by some curious hitch—it is true, Lady Doncaster had sent a telegram in the interval—her ladyship was not on the train when it reached Brighton. Sir Robert was on the platform, and expressed his great surprise and consternation not to find his wife there. But, like a wise man, he bore up under the disappointment. It was natural that the two men should patronise the same hotel and take wine together. Sir Robert was in an expansive and reminiscent mood, and, after the second glass of port, talked freely of his dear old grand-aunt, with whom he used to stay as a child, and who had left him all her belongings. Perhaps it was the port—or it may have been the thoughts of his early youth—that caused Sir Robert to be sentimental.

But Mr Moses was not a sentimentalist, and he had no use for reminiscences of other people. So he took out his cheque-book and said, 'Now, Sir Robert, I am going to make you a first and final offer. I will give you £10,000'—this is not the exact amount, but it is near enough—'for your grand-aunt's portrait by Gainsborough.'

Sir Robert remained silent for a moment or

two. He remembered that agriculture was far from flourishing, his rents were coming in slowly when they came at all, and, for other considerations, £10,000 was not to be sniffed at. So he simply said, 'Make out the cheque, Mr Moses.' Duly made out and signed, Sir Robert took the

cheque, looked at it for a second or two, and placing it in his pocket, said, with just the trace of a smile on his lips, 'Mr Moses, I am so glad you have got the portrait of my grand-aunt. She was the curse of my young life. *I always hated the d—d old cat!*'

THE PARTS MEN PLAY.

CHAPTER XI.—*continued.*

IV.

WITH her arm in his, their subdued voices trembling with the repression of emotion, they retraced their steps. Back past the church with its white gravestones so curiously peaceful in the midst of it all; past the inn, jovial with light and the clamour of village oracles; past the forge, with its lifeless fires a presage of things to come; past the cross-roads, where the sign-post, silhouetted against the sky, seemed no longer a gibbet, but a crucifix; past cottages stirring with unaccustomed life, unconscious of the unbidden guest that was soon to knock with ghostly fingers at almost every door.

Along the quiet English lane they walked, but though the closeness of the girl beside him was ministering to the senses, his mind remained so clutched in the grip of thought that his head throbbed with pain with each step of his foot jarring upon the road.

They had reached the entrance to the estate and were nearing the house, when his reverie was broken by the sound of a quivering breath and a trembling of the hand on his arm. Like a conflagration that is already out of control, his brain flared into further revolt with the stimulus of a new resentment—he had not thought of woman's part in the thing.

'Elise,' he cried, 'this is monstrous. It is only the vile selfishness of men that makes it possible. They are not giving a thought to the women, yet you are the real sufferers. Now I know what you meant when you said that women don't have their place in the world. If they did, this never could have happened; for their hearts would never permit the men that are born of women to slaughter each other like bestial savages. Now is the time for you to speak. This is the hour for your rebellion. Let the whole world of women rise in a body and denounce this inhuman, insufferable wrong. If your rebellion is ever to come, let it come now.' . . .

The hand on his arm was wrenched free, and Elise stood facing him with fury in her eyes.

'Are you mad, Mr Selwyn? Or is this your idea of a joke?'

He stared at her, dumbfounded. Her eyes were glowing, and her lips were parched with the fever of the breath passing through them.

'A joke?' he said. 'Great heavens! Do you think I would jest on such a subject?'

'But—— You mean that we women should organise, rise up, to hinder our men from going to war?'

'Doesn't your heart tell you how infamous war is?'

'What does that matter?'

'But, Elise,' he pleaded desperately, 'some one must be great enough to rise to the new citizenship of the world even if martyrdom be the condition of enrolment. It is far, far harder than snatching a musket and sweeping on with the mob, but it is for people like you and me to have the courage to try to stem this flood of ignorance, to stop this butchery of women's hearts.'

'Women's hearts'—— She laughed hysterically. 'And you believe that you understand women! Do you think war appeals us? Do you think because we may shed tears that it is from self-pity? Rubbish! There are thousands of us to-night who could almost shout for joy.'

'Elise!'

'I mean it. Don't you see that to-night our whole life has been changed? Men are going to die—horribly, cruelly—but they're going to play the parts of men. Don't you understand what that means to us? *We're part of it all.* It was the women who gave them birth. It was the women who reared them, then lost them in ordinary life—and now it's all justified. They can't go to war without us. We're partners at last. Do you think women are afraid of war? Why, the glory of it is in our very blood.'

'But,' cried Selwyn, 'you can't think what you are saying.'

'I don't want to. All I know is that I could sing and dance and go mad for the wonder of it all.'

He took a step forward and grasped both her wrists in his hands.

'Listen to me,' he said, his jaw stiffening as he spoke; 'some of us have got to keep our sanity in this crisis. You know better than I, for you have described it to me, that this country has been darkened with ignorance just as Germany and the rest have been. This is the climax of it all—and you're going to help it on, instead of having the courage to take your

stand. Elise, to-night I pledged my whole life to a crusade against the darkness that men are forced to endure. It is going to be a long fight, and perhaps a hopeless one, although some day, somehow, the cause must win. And I need your inspiration. Oh, my dear, my dear, you must know how much I love you. Every minute that you're away I'm hungry for you. When we were together that evening by the stream I longed so to take you in my arms that my heart ached with the repression I forced on myself. I have known that there were a thousand difficulties in the way, and I was not going to speak, but the other night when you met your brother by the oak'—

'Oh! you were spying.'

'It was an accident. I said nothing to you about it, but I thought that perhaps you needed me a little, that it might be my privilege to share your sorrow. And to-night, dear, I know that together we could work and live, and be a tremendous power for good.'

Her face, which had gone strangely pale, was darkened by a return of the crimson flush.

'Do you think I'd marry you,' she exclaimed scornfully—'a man who counsels treason?'

'I counsel loyalty to the higher citizenship.'

'H'mm!' Her shoulders contracted, and forcing her wrists free of his hands, she looked haughtily into his burning eyes. 'You had better go back to America and tell them there of this ignorant little island whose men are so crude and stupid that when the King calls they go to war.'

'Elise'—

'I would rather marry the poorest groom in our stables than you. He would at least be a man.'

'I have not deserved this, Elise. God knows I am no more a coward than other men, but I feel that I have seen a great truth which demands my loyalty.'

'It is easier to be loyal to a truth than to a country.'

'You know you are wrong when you say that. Come—we are both unnerved to-night. Perhaps I was injudicious to speak at a time when I should have known that you would be overwrought, but I could not keep back the love which you must have read'—

'Please, Mr Selwyn, you must never mention that again. I don't want to marry you. I don't want to marry any one. I always said that a women's rebellion would come, and I feel in my blood that it has started to-night. I don't know how, or when, or where, but I am going to join it and'—

'Then you agree with me?' he cried eagerly. 'You feel that the women of this country should rise, and try to prevent this catastrophe?'

'You fool,' she said, half in pity, but with a sneer; 'you poor blind American! Yes, there's going to be a revolution against conventions, Society, customs, morality, for all I know.'

They're all going overboard. We've hoisted the black flag to-night, but with one, and only one, object—to help Britain and the men of Britain to fight!'

And the British Fleet, at the King's command, was steaming out into the night.

CHAPTER XII.—THE HONOURABLE MALCOLM DURWENT STARTS ON A JOURNEY.

I.

AN early morning mist hung over the fields of Roselawn. From his nest in the branches of a tree, a bird chirruped dubiously, as though to assure himself even against his better judgment that the rain was only a threat. The woods which bordered the meadows were blurred into a foreboding, formless black, like a fringe of mourning, and the distant hills stood sentinels at the sepulchre of nature.

Flowers, rearing their lovely necks for the first caress of the sun, drooped disconsolately, their petals like the lips of a maid who has waited in vain for the coming of her lover. Cattle in the fields moved restlessly from one spot to another, finding the grass sour and unpalatable. Through the damp-charged air the melancholy plaint of a single cow sounded like the warning of rocks on a foggy coast.

In the air which was unstirred by a breath of wind the very buildings of Roselawn seemed strangely motionless, with their roofs glistening in their covering of moisture. And through an archway of trees the distant spire of the church on the hill rose above the mist as a symbol held aloft by some smoke-shrouded martyr of the past.

A hound with apologetic tail came stealthily from the house and made for the cover of the stables. A horse rattled its headstall and pawed the flooring with a restless hoof.

With a feeling of chill in the air, Selwyn rose at seven, and dressing himself quickly, left the house for a walk before breakfast. His body was fatigued from the long vigil of the mind which had kept at bay all but a short hour of sleep, but he felt the necessity of exercise, as though in the striding of limbs his torturing thoughts might lessen their thumbscrew grip.

His feet grew heavy in the thick dew of the grass, as he plunged across the fields to a path which led through the woods, where squirrels, coquetting with the intruder, dared him to follow to the summit of the oaks.

Heedless of the morning's melancholy, yet unconsciously soothed by its calm solace, he went briskly forward, and his blood, sluggish from inaction, leaped through his veins and coloured the shadowed pallor of his face with a glow of warmth.

He had lost her

That was the dominant note of his thoughts. What a jest the Fates had prepared for him that the very moment when the incoherencies of his life were crystallised by a great flash of truth—the very moment when he had felt the overwhelming impulse to consecrate his life in a crusade against Ignorance—that same instant should witness the snapping of the silk threads of his love!

How scornful she had been—as if he were something unclean, too low a thing for her to touch! This girl, whom he had pitied for her loneliness—this woman who had ridiculed the life of England and declared that it was stifling her—had said that the glory of war was in her blood. She had called him a fool because he dared to say that carnage was wrong. He had thought her an advanced thinker; she was a reactionary of the most pronounced type.

A feeling of fury whipped his pulses. Confronted her and her unbridled tongue! What a fool he had been to woo her! One might as well try to coax a wild horse into submission. She would have to be conquered; she should be brought into subjugation by the stronger will of a man, for only through surrender would she achieve her own happiness. At present she resented equally the conquering of herself physically and mentally. For her own sake she must be taught the perversion of her outlook on life.

And Austin Selwyn, the idealist, little thought that he was applying to Elise Durwent the same philosophy as Prussia was applying to Europe.

But of one thing he was certain—much as he loved her (and at the thought his heart grew heavy with longing), his words on war had not been the idle declaimings of a sophist. There *was* a higher citizenship; the world *was* wrong to allow this war; and ignorance *was* the foe of mankind.

He would not withdraw from that platform. Duty was not something from which a man could step lightly aside. All his writings, all his thoughts, all his half-worked-out philosophies had been but training for this great moment. And now that it had come he would not prove renegade.

He would write with the language of inspiration. The agony of Man would be his spur, so that neither fatigue nor indifference could impede his labours. With the tears of the world he would pen such words that people everywhere would see the beacon-light of truth, and by it steer their troubled course.

Five miles he covered in little more than an hour, and with the returning sense of strength his purpose grew in firmness.

The call of the Universal Mind had penetrated through the labyrinth of life as the sound of the hunting-horn through leafy woods. There must be millions, he knew, who were of that great unison, kept from *ensemble* by the absence of co-ordination, by the lack of self-expression. It might not be for him to do more than help to light the torch, but, once lit, it would burst into flame, and the man to carry it would then come forward, as he had always done since ages immemorial, when a world-crisis called for a world-man.

A sudden weakness crept into his blood. He was nearing home, and in a few minutes would see her again. If only he could have left the previous night on some pretext—but now he would have to wait until the afternoon at least. How strange it was to think of losing her! How wedded his subconscious thoughts had been to living out the future with her as his revelation of Heaven's poetry! Would he have the courage to maintain his purpose, or, at the sight of her, would he throw himself at her feet, and, admitting failure, plead for mercy to the vanquished?

No. A thousand times no. Anything but that.

Reaching the clearing in the woods, he paused as the ivy-covered towers of Roselawn were presented to his gaze. With a characteristic working of his shoulders he drew himself to his full height, and his jaws and lips were set in implacable determination.

The mist still clung to the earth, but over the north-east tower of Roselawn he could see the sun, monstrous and red, looming with its sullen threat of heat.

(Continued on page 248.)

THE TRADE IN WILD BEASTS.

I.

THE fascinating traffic in wild beasts, the capture and collecting of animals from all corners of the world, is a business which has largely been in German hands, although the principal hunting-grounds and hunters have always been British.

Germany in future is going to take a 'back-seat' in this as in many other trades. A syndicate of British sportsmen some time ago

founded The World's Zoological Trading Company, Limited, and there will be no room for anything German in it—absolutely none.

There are many reasons why this trade in living creatures should never again pass into the hands of the Huns. Most people interested in this strange business are aware that it was not always a monopoly of Germany. Its headquarters used to be in 'the hub of the universe;' and London's trade in wild animals and birds was founded seventy or eighty years ago by

Charles Jamrach (1815-1891), who came to this country from Hamburg in his youth. In those days London was the sole emporium for this trade in the whole world. All the Continental dealers came to Jamrach's, and the collectors who hunted in the Sudan and Abyssinia all brought their spoils to London.

Fifty years ago, however, Carl Hagenbeck, the great German dealer in wild animals, took his initial grip of the business, and eventually his zoological depot at Hamburg became the largest animal emporium in the world. Quite three-fourths of the trade done in wild beasts passed through his hands.

But to-day this is altered. We have come successfully through a world war; tremendous happenings are impending; things will never again be as they were in any sphere of commerce, trade, or industry. Our eyes have been opened to the vast potentialities of businesses which we affected to disregard, or at best treated lightly, and not infrequently, indeed, finally let slip into the keeping of our grasping and more enterprising Teutonic rivals.

Dealing in wild animals was one of the businesses which we foolishly allowed Germany to annex. This should never have happened—if for no other reason than this: the German is not a true sportsman. More often than not the animals he handled were subjected to cruel and callous treatment; frequently half-starved, they were also housed in unhealthy and insanitary back-yards.

Better things are assured from the new syndicate. The men who compose it are naturalists and lovers of animals, and not only will they bring to bear on the wonderful wild life of the African plains and the Indian jungle more humane treatment, but methods, scientific and entirely new, will be applied to the capture and the taming of the animals.

To supply zoological gardens and animal parks with healthy living specimens of the wild fauna of the earth is the primary object of the company's formation. They claim to be able to supply any animal you care to name, from a mouse to an elephant, from a baboon to a rhinoceros or a baby hippopotamus; while lions, tigers, bears, leopards, pythons, giraffes, antelopes, gazelles, porcupines, monkeys, birds of any variety—in a word, any beast, bird, or reptile that exists to-day—can be procured within a reasonable time.

II.

Game-reserves have already been established in East, West, and Central Africa, and the British, Belgian, French and Portuguese Governments are not merely interesting themselves in the undertaking, but are doing all they possibly can to make it a thorough success. That the company is a real, live, up-to-date concern may be gathered from the fact that

on their West African reserve alone there are over £50,000 worth of rare wild beasts with many species of rare birds, fish, and reptiles.

'Our aim,' said one of the founders of the enterprise, a well-known sportsman who has spent the greater part of his life hunting and trapping all over Africa, 'is not to destroy wild life, but to preserve it. There is no animal which it is not possible to capture alive and at least partially tame, so that it can live in captivity. We drive the freshly caught animals into large paddocks which have been constructed in our reserves, and there leave them until they have recovered from their fright. They have ample grazing-ground and a plentiful supply of water. Our men then venture into the enclosures and stroll about among the animals until they become accustomed to the sight of human beings. As soon as their natural shyness has been overcome they are herded into smaller paddocks, where any peculiarities or traits they may possess are noted, and—more important still—where they are gradually accustomed to the food they will receive when in captivity. In this way the zoological gardens are assured of a healthy beast, one that, with proper care, will live to its allotted span of life.

'Never before,' continued the expert, 'have these wild beasts been in such demand. Every zoo is crying out for animals. They have had no new stock for over four years, while many valuable creatures have been lost through the difficulty of feeding them properly. We have orders for £40,000 worth of animals from American gardens alone, another £20,000 worth from the British zoos, and also orders from the Continental parks.

'Naturally the rarer beasts are expensive, running in some instances from £500 to as much as £1000 apiece. The fact is, the animals are getting scarcer every year, and must continue to do so as civilisation advances and the wilder parts of the earth are opened up to settlement.'

From a purely financial point of view, the trapping and transporting of wild animals often involves great losses; on the other hand, it brings now and again vast profits.

The money aspect of the business apart, the trade in wild beasts, their capture and transport to this country, is a dangerous yet fascinating profession; it is also one which necessitates considerably more craft and skill than the pursuit of game for the sake of skins or ivory. Even so, however, it may truthfully be said of the men who deal in this curious merchandise that once a collector, always a collector.

At the same time it should be clearly understood that only the best men can carry out the requirements—trained men; men with muscles of iron, hearts of oak, and the digestion of an ostrich; men who are ready to risk all, to carry

their lives in their hands; men who know how to deal with the savage as well as with the savage beast.

But the modern animal-collector must be possessed of more than the highest physical attributes—indispensable as these unquestionably are—and among his other qualifications he must be something of a naturalist, and a scientist too. He is not a mere slaughterer of big game, since his mission is not to destroy, but in many cases to preserve specimens of rare animals which are rapidly being exterminated through man's short-sighted greed for horns, ivory, or hides. The collector is frequently called upon to penetrate into unknown lands, and has to be prepared for every emergency. His caravan is invariably more unwieldy and more difficult to manage than that of an explorer. Every step he advances he is always adding to it, for his business is to collect animals, skins, and other things of value to the dealer. His men and his animals have to be fed and constantly looked after.

III.

Broadly speaking, we may call the African continent the happy hunting-ground of the animal-collector. He journeys into the wild with a little army of trusted white hunters, a supply of camels for transport, and a large cavalcade of native hunters and trackers. The method by which these expeditions generally effect the capture of young animals is by chasing the herd until the young, lagging behind, can be isolated from their parents. They are then easily seized and made secure.

Among giraffes and antelopes, and even among buffaloes, which have no qualms about deserting their young, there is but little danger in the capture; but with rhinoceroses and elephants the process is not so devoid of risk. These great creatures turn ferociously in defence of their young, and in many instances it is only by first killing the parents that the young can be secured.

In the case of big beasts, with hardly an exception, the young are taken. This is only reasonable, as a large wild beast is difficult to hold, let alone transport many hundreds of miles across barren country.

Abyssinia is the great lion-hunting ground to-day. Here the collector employs the natives to help him. They know the dens of these creatures, and by watching can tell whether there are any young. Their aim is to rush the place when both parents are away, and carry off the cubs. If they are mere kittens, a few days old, the task is an easy one; but cubs eight, six, or even four weeks old can offer a stout resistance with their claws and teeth. If taken young, cubs can easily be brought up in captivity, to which they readily accustom themselves. They are suckled by goats, and it is surprising how

very fond the little ones grow of their foster-mothers, jumping and playing round them as if they were a family party.

Young tigers are obtained in the same way as lions. Now and then full-grown tigers are recruited. This unusual practice, however, is resorted to only by low natives who hope to earn a few rupees by capturing a full-grown tiger for some one who, they have heard, is open to purchase. The proper agents of wild-beast dealers very rarely attempt to capture a large tiger, knowing the game to be hardly worth the candle, more especially as a grown tiger, unable to accustom itself to life in captivity, would probably go mad or pine away to death.

Leopards and hyænas are frequently caught full-grown. Leopards endure captivity a great deal better than other members of the cat family, and being less heavy and powerful, are more readily managed, even in their most ferocious moods. In order to capture them, huge traps are set. Sometimes these traps are made of wood; sometimes they are cut out of the solid rock. They act much on the principle of the common mouse-trap; that is, they have a hanging door in front of the entrance which is raised by a lever held down by a baited hook. The bait consists of meat. The animal comes in and seizes the bait, the lever flies up, the door shuts down upon him, and he is held fast. The hunters then tie his legs together, muzzle him, and bear him off in triumph to the zaireba.

Every reader knows how elephants are captured in India by being driven into large enclosures. In Central Africa zebras are caught in much the same way.

IV.

Giraffes are peculiarly difficult to obtain. To begin with, they are rare, and are becoming more so year by year; they are also exceedingly timid and swift-footed. When a zoo gets hold of a good giraffe it pats itself on the back, so to speak. It can scarcely be said that there is any fixed method of capturing giraffes; almost every possible way has been attempted—usually in vain. The greatest difficulty is to come up with them, for they scurry off at the slightest sound of a human being, and can, of course, outdistance any horse. The most successful method, however, is by using a long cord, at each end of which is a round weight. When the hunter has succeeded in getting sufficiently near his game he throws the cord in such a manner that it winds round the beast's legs, either bringing him down or rendering him incapable of escaping before he can be otherwise restrained. It is a difficult feat to accomplish, even when the giraffe allows the hunter to approach comparatively close; and the transport difficulty is also a serious one. Most giraffes seen in captivity have been caught by chance when quite young.

Nobody has ever yet recruited an adult hippopotamus, and the probability is that if anybody ever does accomplish this great feat he will regret it. Hippopotamus calves are difficult enough to deal with when they are in their infancy, at which age they are generally captured. Pitfalls are dug for the hippopotamus, which has the habit of allowing its young to trot along in front of it instead of behind, so that it can have its eye open to any danger to its offspring. The young creature appears to vanish into the earth, through the branches which cover the pit, and the terrified mother turns and bolts. Then, always supposing that he can annex his prize before a lion or a leopard strips its bones, the hunter has his work cut out to get the weighty youngster out of the pit. A noose is passed over the neck and the forelegs, and the legs are bound securely together. Then a sloping pathway is dug out of the pit, and the baby hippo, a weight of about half a ton, is hauled upon a stout litter through the bush to the nearest river, where it continues its journey on a native barge. The hippopotamus is malicious and dangerous from the day of its birth, and becomes reconciled to captivity only after many months.

A very special trade is that of the water hunters, whose quarry is the crocodile and the hippopotamus. The Havati of the Sudan attack these creatures in their own element, being expert swimmers. Their weapon is the harpoon, which must be used so as to disable the young animal without causing a serious wound. The scars of the harpoon-wounds are to be found on many of the captured crocodiles in European collections. The creatures have wonderful healing faculties, and when muzzled and confined in trap-pools soon become fairly manageable.

Bears are not troublesome customers as a rule. The great grizzly—a perfect terror when his temper is 'up'—has been taken again and again with the utmost ease whilst quietly sleeping. Black bears also hibernate, and are easily captured in consequence. Brown bears are trapped in Scandinavia without serious difficulty, for they have an irresistible liking for honey, to obtain which they will go into any danger. As often as not the Polar bear from the Far North arrives at the dealer's depot as a cub in a barrel. It has been brought home on a whaling-vessel.

Monkeys are caught in specially laid traps. The various species of snakes and reptiles are taken in different ways. This is how their capture is effected in India. During the dry season the jungle which they infest is set on fire. The snakes dart out in all directions. It is a thrilling sight, especially if the bush contains some cobras and other deadly species. The men are furnished with huge butterfly-nets, and stand, illuminated by the fierce conflagration, scooping up the terrified and

hissing serpents as they appear. The snakes are then packed in boxes and sent to Calcutta or Bombay for shipment to Europe. They need neither food nor drink on the journey, but must be carefully shielded from cold, which is certain death to them.

In Borneo the natives take the bigger serpents—like the python—after they have gorged themselves with a meal, when they are more or less lifeless and can be handled without danger. Others are caught in traps and by means of the noose.

Specimens of the various species of deer found in Siberia and other cold countries are obtained by driving herds into deep snow, where the young, being unable to extricate themselves, fall a prey to their pursuers.

v.

Probably long before the wild-animal collector has come to his journey's end his camp will have begun to resemble a travelling menagerie. Young elephants, giraffes, hippopotami, and buffaloes fill the improvised stalls. Wooden cages are stocked with panthers, wild pigs, and baboons. Young lions, half-grown leopards, wild beasts of almost every description, birds, reptiles—all have to be fed, watered, and carefully attended to. The expensive expedition—which may last for eighteen months and cost thousands of pounds—is not undertaken for the procuring of two or three specimens.

Travelling mostly by night, on account of the excessive heat during the day, the caravan resembles a modern Noah's Ark procession more than anything else. Some animals are driven; others are carried, slung in litters and cages between camels. Hundreds of sheep and goats move along with the procession, the goats to provide milk for the unhappy orphans, the sheep to provide food for the carnivores.

Nor can it be said with certainty that, the animals captured and apparently in safe keeping, the rest is merely a matter of transport. One never knows what is going to happen with such a huge cavalcade. Hagenbeck on more than one occasion learnt this to his cost. Once—it was in pre-war days, of course—his people had been busy in Russian Turkestan, where they had collected a number of precious animals, when, lo! a flood overwhelmed them near the Syr-Darya, and swept away their deer, their pheasants, and everything else—the labour and expense of months lost in a few minutes!

As a matter of fact, the whole business of trapping and transporting wild animals is something of a gamble—a romantic gamble, certainly, but a gamble nevertheless—with an almost irresistible appeal to men who love adventure and the virile life, who fear neither wild man nor wild beast, and who have sufficient philosophy to enable them to take failure or fortune as it comes.

Such is the stuff of which the successful animal-collector is made—a man who is well worthy to rank among the merchant explorers of wild places; a man to whose courage, enterprise,

and activity is in no small measure due our knowledge of the mammals, the birds, and the reptiles which have their habitat in the world's remote and unfrequented regions.

'A-L A Z Y-Z'

PART II.

VI.

PUZZLED Pete gave his horse a vicious dig with his heels, and rode off without another word. John Macdonald Rae strode back into the house.

'They're coming in,' he announced, continuing his poker simile. 'The sheriff will be the next, and like enough Gentle Jim will be with him. Of course, they have got it all framed up for the sheriff to be ready, and I know the court is in session down in Glendair this week. If they weren't so sure of getting me, they would have had the gump to wait a few days till the court adjourns, and then they could have taken me down to Glendair and got me bound over for the next sessions; and as I am not well acquainted here, and could not get anybody on my bond, I should have had to stay in jail nearly six months. In that case I could not represent my claim. You see, Lucy, the law of this country is that a homesteader must not be away from his claim more than five months. If he is, he forfeits his rights, and anybody is at liberty to jump his claim, as they call it. But they are so dead-sure of me, they didn't bother about waiting.'

Pretty Lucy had thought for only one thing. 'Do you mean to say they will put you in prison, John?'

'They sure will,' said her husband, smiling. 'But only for a day or two, till the case is heard, if you do what I tell you, little girl.'

'Oh, John!'

John kissed her, and patted the fair hair. 'Don't worry, sweetheart,' he consoled her. 'Gentle Jim Andrews is going to hit a snag. Now listen. Just as soon as the sheriff starts down with me to Glendair, you drive the cows over to Stanley Henderson's place—that's just twelve miles away from here. You can stop with Stanley's wife to-night, and come on to Glendair to-morrow, in time for the fun. It's going to be a mighty game of bluff between me and Jim, and we are going to make all the play. The minute I get to Glendair I shall hire an attorney I know—it's no good employing the court attorney for the defence. Court attorneys in this country are just penitentiary agents; their job would burn their fingers if they got too many of their clients off. Now, just listen very carefully while I tell you what we are going to tell the court.'

John proceeded to unfold in detail his plan of campaign. His young wife was not so enthusiastic about it as he had hoped, but in the end her love overcame her scruples, and she could not but recognise the force of his contention that the ethics of Montana were not those of Scotland in the matter of legal procedure.

The afternoon was still young when Pete Jorsen returned, bringing with him the sheriff and Gentle Jim. It was clear that Pete had not had to ride very far to find those gentlemen.

The moment Lucy set eyes on the big rancher, she knew that, right or wrong, she would do all in her power to defeat the infamous scheme of that towering rascal. Swinging himself from his great horse, Andrews strode to the corral fence, coolly identified his mark on the hide, and stood stroking his tangled gray beard without further speech, watching the Raes from under his frowning bushy brows while his stockman preferred a formal charge of cattle-theft against John, and repeated his version of the morning's conversation. Rae making no protest, the sheriff duly arrested him.

'Before I go with you,' said John, 'I want to show you something.' They followed him to a spot between the corral and the house, and he pointed to the blood-patch on the ground. 'You see that, sheriff?'

The sheriff said he saw it.

'Do you see it, Mr Andrews?' asked Rae.

'Of course I see it. What about it?' said the rancher.

'And you see it too, Pete, don't you?' said John.

Pete also said he saw it.

Declining to satisfy their curiosity as to his reasons for showing them the mark, Rae said good-bye to his wife, and before night was safely lodged in jail.

VII.

Two days later his case came on for trial. The prosecution deposed that a Hereford steer was missed from Mr James Andrews's ranch nearest to Myrtle Spring; that, on inquiry being made, the defendant admitted that he had killed the steer; that the quarters of the animal were found on his premises, three of them already in his brine-barrel, the fourth actually in process of cooking in his house. The identification of the hide was described by Mr Andrews. The defending attorney put but one question to the witnesses.

All agreed that they saw a patch of blood which the defendant showed them between his corral and his house, rather nearer to the house than to the corral. It was also not disputed that the defendant offered the meat to Mr Andrews's man and to Mr Andrews. What else could he do, asked the prosecution, taken red-handed as he was?

No case could seem clearer. It appeared that the defendant's attorney was making an exceptionally poor job even of a hopeless case.

And then John Macdonald Rae took the stand. The court gazed on him with mild interest, not unmixed with good-humoured pity, as on a man likely enough to be innocent of the charge against him, but too weak to keep his end up against the powerful influences he had challenged. But gradually the court opened its eyes and its ears.

The kind reader who has followed the fortunes of John Macdonald Rae to this point is respectfully requested not to conceive the homesteader as a hero of romance. The moralist, indeed, must here definitely turn away his face from John, and even the plea that East is East and West is West must not induce him to alter this very proper attitude. That Rae was fighting with his back to the wall against the full might of the law, primed with perjured testimony, and further doubly fortified by the most damning circumstantial evidence, may perhaps serve John in extenuation, but that is the utmost that can be said for him.

The court at Glendair, however, did not consist of moral philosophers, and every eye was turned on Rae as he stood and drawled his defence.

He related how his wife and he were unable that morning to find their milk cows till long past milking-time, when they turned up, accompanied by the *casus belli*—that is to say, the steer. Still attended by the steer, they went into the corral, and Mrs Rae went in to milk them. Before she had fairly got started the steer made a charge at her. In the nick of time she reached the fence, climbed over, and ran to the house for her husband. Warming to his narrative, Rae proceeded to describe how he went into the corral to drive the steer out. It was very wild, and charged at him too, and he also had to save himself by the fence. He got over in safety; but as he had left the gate of the corral open, the infuriated steer burst out and chased him round the exterior of the corral. With the mad animal in full pursuit, he made a desperate run for the house, where his wife, seeing his imminent danger, ran pluckily with his rifle to meet him. He swung round, to see the steer within twenty yards of him. 'I plugged him, and he dropped in his tracks pretty nearly on top of me,' concluded John in a matter-of-fact tone.

Mr Rae's attorney proceeded to dot the i's and cross the t's of this plausible story; nor did he omit to emphasise the presence of mind of husband and wife, which had saved them from a danger so threatening, and the thoughtfulness

with which they had immediately taken steps to preserve for the owner's use as much of the meat as was possible in view of the hot weather. He pointed out that Rae had shown the witnesses for the prosecution the blood-patch where the steer had fallen, that he had at once offered them the meat and the hide, and that his demeanour throughout had been that of an innocent, not to say injured, man. Mrs Rae was called, and circumstantially bore out her husband's version.

From pretty Lucy, too, the eyes of the moralist must be sadly averted. But it is the duty of the chronicler to put no gloss upon facts, and to present Mr and Mrs Rae, not as they ought to have been, but as they were.

To say that the court was flabbergasted would be but a poor description of the effect produced. Judge and jury, sheriff and learned counsel, and witnesses for the prosecution looked at each other. Not all of them were deceived, but they were spell-bound. The whole series of events was too natural, plausible, and indeed obvious to bear disputing. The evidence was as plain as daylight, and the most venal tribunal could not, in face of such evidence, do other than register an acquittal. Indeed, his honour, in discharging the accused, felt it incumbent on him to compliment Rae on his behaviour under circumstances which must have been so trying to him. John Macdonald Rae was accordingly discharged, without, as he was assured, a stain upon his character.

VIII.

Outside the precincts of the court, the defendant sought a personal interview with the prosecutor. He achieved it in the bar of the 'Mint,' where, notwithstanding the towering presence of the ranch king, his entry was the occasion of a general murmur of approval.

Gentle Jim strode to meet his successful rival, and from the vantage of his superior inches regarded him with a wry grin, while he folded his great arms across his ragged beard, and straddled his mighty legs like a colossus. He had been feeling pretty bad when he entered the 'Mint,' but the soothing influences of that place of popular assembly had had time to operate, and though he would have sent the homesteader to jail on faked evidence without turning a hair, as a normal operation of ranchers' war, he was too big a man to bear a paltry grudge.

'Say, Rae,' he remarked at once in the hearing of the company, 'that was a dandy bluff of yours. What's your poison?'

'Now, see here, Jim Andrews,' answered Rae; 'I want to ask you a question. Is it to be peace or war?'

'What do you mean? You're an innocent man, and I'm a mistaken one, ain't we?' Jim chuckled, and so did the rest.

'You know what I mean right enough. I want to know whether it's to be peace or war. I don't give a darn which. There's that spring

of mine where your stock water. I presume that's a pretty good spring. Well, if it's going to be peace, your stock may drink at that spring till they bu'st, and I won't interfere. But if it's going to be war, then I run a fence around, and every head of yours that wants a drink is going to pay me a dollar a time, and every beast that crosses my section without permission I'm going to impound, and charge you up a dollar a day for keep. And I sha'n't send any special messenger to tell you when there's one in pound. Get me?'

There was a silence in the bar as he finished.

'I get you,' answered Gentle Jim. 'But I don't see why you should bear malice for a little misunderstanding. Look here; I'm short of hands, and there's a lot of stuff wants getting up to my home ranch from the city. What do you say to doing a bit of hauling for me?'

'Depends on the pay,' said Rae with ancestral caution.

'I'll pay you eighty dollars a month and your grub.'

'I'm your man,' said Rae.

'Guess it will be kinder lonely for your wife to stay on the section while you are up at my place,' said Jim. 'I've got plenty of room, and my wife can do with a bit of help and company. You can drive your cows up to my place while you are with me. They will be all right.'

'I'll ask my wife,' said Rae.

He talked it over with Lucy on the road home, and was convinced, upon reflection, that the plan promised well. 'Jim don't give up as easy as all that,' he remarked. 'We haven't shaken hands yet, and there's sure some devilry hatching in that tousled head of his. I've a kind of notion what it is, but we'll learn in time. Meanwhile it's good money, sweetheart, and, anyhow, it's up to us to see it through.'

IX.

So it came to pass that John Macdonald Rae enlisted under the standard of A-Lazy-Z. His money was punctually paid; he and his wife were comfortably quartered, and they gave good service. For exactly five months Rae drew his monthly eighty dollars, and on the last day of the fifth month his employer came to him as he was finishing the unloading of a wagon of iron roofing which Rae had brought up that day from the town.

'Say, John,' said Gentle Jim, 'there's a score of sheep to go down to-morrow to Maxson the dealer, and there's a lot of supplies to come back from the Amalgamated Stores. Guess the Stores people may not have them fixed up in time for you to return the same day. And the team has had some hard work. You had better figure on staying the night in town.'

Rae put his hands in his pockets, and looked queerly at his employer, who returned the look with a bland stare.

'Jim Andrews,' said Rae bluntly, 'you can go to blazes. You know as well as I do that if I stay away from my place another day you can go and jump my claim, and finish with me for good and all. And you figured on that when you got me to start on this job. And, what's more, I knew you figured on it!'

'Well?'

'Well, first thing to-morrow my wife and I are going to dig out for Myrtle Spring and represent my claim. Get me?'

Whether Mr Andrews got Mr Rae or not he did not say, for at that moment one of his cow-punchers came galloping up, and flung himself from his horse.

'Mr Andrews,' he shouted, 'your place is afire, blazing to beat the band!'

With a great oath Gentle Jim swung round, and looked in the direction of his home. There was no doubt about it. Over the far shoulder of the hill, draped in its pure winter mantle of snow, the fine timber home that was his pride was dark beneath rolling clouds of smoke, through which, here and there, shone a red angry glow.

Without a word, Andrews threw himself on the waiting horse, and galloped away across the rise. Rae and the cattleman followed at a run. When they reached the house, it was plain that the place was doomed. Fire was pouring from the windows. There was no water in that frozen land; and if there had been, nothing could have saved the structure. The greater part was already a roaring furnace. Every man about the place was hard at work saving what could be saved of the contents. Rae learned that no lives were in danger, though Mrs Andrews had had a narrow escape, having been brought out unconscious from the fumes.

He found his wife tending the senseless woman in an outhouse, and Gentle Jim standing beside them, staring stonily at the fiery ruin. Almost as Rae arrived, Mrs Andrews opened her eyes. She shuddered, stared about her wildly, and raised herself on her elbow. The red light from the burning house met her eyes, and suddenly she gave a piercing shriek: 'The boy! Frankie! Oh my God, the boy!'

Like a man electrified, Jim sprang at Mrs Rae and seized her by the arm. 'Woman,' he shouted hoarsely, 'you told me my boy was safe! You told me he went over to the pine-wood with the foreman's son.'

Held in that fierce grip and faced with those terrible eyes, Lucy went white to the lips. But she faced the maddened giant bravely. 'I saw them set out together after dinner. I have not seen them since.'

'Frankie came back in an hour, and said he didn't feel right. He's in his bed. Save him! My child! Save him!' The poor mother's wail was dreadful. She struggled in vain to rise.

'I'll save him, girl, or I'll die!' cried Jim. He rushed from the barn, and Rae followed. Well

he guessed the awful agony of the stricken parents, for the devotion of Gentle Jim to this his darling only child was the one characteristic about him that his nickname did not satirise. But well Rae knew, too, how small was the hope of any living thing surviving in the glowing furnace before them.

X.

The only portion of the great house which was not by this time completely engulfed was the south-west angle, and even here the heat was terrible, and the smoke was rolling in volumes. The wind was from the south-west, and all the ranch hands were over on the opposite, lee side of the house, striving to prevent the spread of the fire to the out-buildings on that side. Andrews and Rae were alone together.

'That's the room,' cried Gentle Jim, in a voice that Rae hardly recognised, pointing to a window over twenty feet from the ground. Wildly he shouted, 'Frankie!'

Tongues of flame were licking round the angle. Minutes, if not seconds, would see the last bit of the structure going up in the universal blaze. A frightful anguish was in the father's face as the red light played upon it. To fetch a ladder would take time, and there was no time.

'The piano, Jim!' cried Rae. 'Quick, man!'

There was a large piano that some one had salvaged from the house, and left in haste standing out in the slush of the melted snow. The two strong men seized it, and carried it as if it had been a rush chair to a point just under the window. The glare scorched their skin as they did so.

'Up-end it, Jim! Up-end it!' shouted Rae.

They turned it up on one end, so that the other lay like a narrow platform some seven feet from the ground. Andrews climbed up on the instrument, and stretched his great arms towards the window. They reached a full six feet short of the ledge. The madness of despair was in his eyes as he glared down.

'Stand firm,' cried Rae, 'while I climb on your shoulders. You can carry me, but I can't carry you.' While he spoke he was scrambling up. Standing on the giant's shoulders, with his hands against the scorching, smoking wall, he was still almost a foot below the ledge.

'Let me step on your hands, Jim, and hoist me up. Steady, boy; steady!'

Leaning on the wall to keep his balance, he felt his feet gripped strongly, till the mighty arms of the rancher were at full stretch below him, and he took firm hold of the sill. The window was closed, and as he smashed the glass with his naked fist the smoke belched out in his face. Next minute, bleeding and half-blinded, he was in the room, groping in the hot, choking darkness for the bed. Through the floor-planking the hungry flame-tongues were curling about his feet. He stumbled against a chair and over-

turned it. He felt his senses going, but it seemed to him the chair fell soft. He stooped, and touched a child's hair.

Catching up the little body, he blundered for very life to the window, and thrust it through. 'Jim! Jim!' he called. Smoke and flame were writhing beneath him now. Tongues of red and yellow shot out from the house wall. Through them he had a glimpse of the upturned face of Gentle Jim.

'Drop him straight, Rae!' came up in a hoarse cry.

Rae dropped him straight. The father caught him, and with the child in his arms leaped clear to the ground, the piano overbalancing as he did so.

Darkness rushed down on Rae. The noise of shouting mingled with the crackling of the fire as he struggled, gashing his hands and arms on the jagged glass, to get out of the window. It seemed that he fought that gasping fight for endless hours. He knew he was falling among fiery tongues. What was it they kept saying, those tongues of flame?

XI.

He's coming to! John, John, my dear!'

John Macdonald Rae could not see very well. His eyes hurt him horribly. But undoubtedly it was his wife's face, all smiling, Lucy's blue eyes, full of tears, that looked down at him.

'Oh, thank God!' he heard her say, and as he tried to sit up her arm was round his neck, supporting him.

John felt pretty stiff, but he sat up, and recognised the barn where he had left Mrs Andrews screaming for her boy. Mrs Andrews was there, sure enough, with the little seven-year-old Frankie on her knees, looking rather white, but otherwise unhurt.

'Your leg's broken, John,' said Lucy, and indeed Rae had just observed that his left leg was in splints. As he tried to move it now it gave him a nasty twinge.

A strange, uncouth figure came striding to the heap of straw whereon John was lying. Its neck and one side of its face were swathed in bandages, and what was left of the face was red and blistered, and shiny with oil. Its great beard was singed half off. It frowned at him with streaming eyes.

'That was a darnation close call,' it said. 'You'll be six weeks in hospital, Rae.'

John stared up at the figure that towered over him. 'Guess you'll be able to jump my claim after all, Jim Andrews,' he said, and smiled foolishly.

'Curse the claim!' said Gentle Jim. 'God bless you, Rae. When you come out of hospital, you can figure on a half-interest in the A-Lazy-Z outfit, if you care to come in. Shake!' He thrust out a great arm, singed, and raw in places.

John Macdonald Rae shook.

THE END.

THE PLANT-WIZARD OF AMERICA: LUTHER BURBANK.

PART II.

LUTHER BURBANK'S methods, indeed, are quite as romantic as his results. All his extraordinary creations and additions to the food-values of the world have been brought about on two plots of land covering together only twenty-two acres. These little plantations, situated at Santa Rosa and Sebastopol, in California, are in some ways the most wonderful pieces of land in the world; they are veritable Gardens of Eden.

Here, for instance, have been created and grown more varieties of the lily than the whole world contained before he began his experiments. Luther Burbank is a remarkably modest man, yet he was only stating sober fact when he said, 'Search this earth all over, climb every mountain, plunge into every cañon, valley, and jungle; and, when all this is done, visit every park, garden, nursery, and conservatory; go anywhere, everywhere, and as many varieties of charming lilies cannot be found as I have produced. All the earth is not adorned with so many new ones as are growing at my establishment.' As a matter of fact over a million lily-bulbs were grown, and 250,000 distinct lily hybrids were produced.

Burbank obtains his results by a systematic method of selection and cross-breeding; and for this work he has peculiar natural endowments which are denied to other men. His sense of sight is extraordinarily developed, and experts who have tested his eyes declare that he is able to detect differences and gradations in colour not noticeable to ordinary eyes. Then his senses of smell and taste are remarkably acute, so that, again, what is impossible to the ordinary man is natural to him. It can be easily understood that with senses like these it is almost an instinctive matter for Luther Burbank to go down row after row of plants and pick out those with the qualities of colour and scent for which he is seeking. He will walk past thousands of seedlings at an ordinary pace, singling out or marking one here and there, and at the end of an hour he has passed in review probably 20,000 plants, and chosen from among them fifty or sixty for further experiments. So uncanny does this power of selection appear that many have doubted its reality, and on one occasion it was put to the test by a horticulturist who was sceptical of its accuracy. He thought no man could possibly make a proper selection at so rapid a rate, and he was invited to prove the matter for himself by experiment.

Accordingly he chose a number of apparently valuable plants from those rejected by Burbank, and these were grafted on to trees at the same time as Burbank's own selections. It was several years before the result could be known, and then

the plant-wizard's choice was in every instance triumphantly vindicated. All his selections bore excellent fruit, while those so carefully chosen by the horticulturist produced either no fruit at all or very poor specimens.

When Burbank gets an idea for the improvement and development of a fruit or a flower, he searches among a very large number of plants for some approximation to the desired quality. Any plants showing such features are carefully tended, their seeds ripened and sown, and from the offspring, generation after generation, similar selections are made until the desired quality has been brought out prominently. During the process hundreds of thousands of plants are produced, and most of these would be regarded by ordinary growers as very fine specimens. But Luther Burbank is seeking only for the best, and consequently so soon as his selection has been made, all the other plants are taken away and burnt. This, to many, would seem like wanton waste, but it is the only possible way if he is to achieve his purpose. Sometimes plants which, if sold, would realise as much as two or three thousand pounds are thus consumed without remorse in a costly bonfire. In one case 40,000 hybrids were destroyed and only one saved; and every year, without exception, some hundreds of thousands of choice plants, many of them bearing, or capable of bearing, delicious fruits or beautiful flowers, are burnt in this way.

Luther Burbank collects seeds and plants for experiment from all over the world, and these he almost invariably sets in wooden boxes in his greenhouses. The soil is carefully prepared, and for particularly important experiments is sterilised with steam before being used. When the seeds have been planted, the earth is covered with a thin layer of sawdust or moss to keep the temperature even; and in all the details the most scrupulous care is taken. Later on the seedlings are transplanted to selected positions out of doors, and they are finally placed in rows in the fields. Plant disease and insect pests are particularly watched for, and any plants which show signs of either are rooted out remorselessly and burnt forthwith; for Luther Burbank in all his work seeks to produce plants which will be immune from disease.

Many of his marvels are produced by cross-pollination, and this is done by transferring the pollen from one plant to the other by means of a fine camel-hair brush. In this way the characteristics of plants from different parts of the world have been concentrated into one. The work of the plant-wizard at Santa Rosa and Sebastopol is, indeed, Mendelism in continuous practice; and if any further proof be needed

of the correctness of the Moravian monk's theories, the experiments in Burbank's Californian nurseries provide it on a large scale.

When the selected seedlings have grown sufficiently, sections are taken and grafted on to healthy trees, instead of being left to bear upon their own roots. This method is found to save very much time; and experience has shown that if the grafts be placed on twigs and small branches, they develop much more rapidly than if they be placed on the larger branches or the trunk. By this system fruit is obtained in the second year, instead of in the sixth or the seventh, as would be the case if the selected plant were left to bear on its own roots. In the aggregate, an incalculable amount of time is thus saved, results being achieved in a few years that would, by the old methods, have taken more than one man's lifetime. There is not space to go into the methods of grafting adopted by Luther Burbank, but it may be explained that, in addition to the use of stocks or scions, much is done by means of budding. A ripened bud with a part of the bark is cut away and inserted in a T-shaped slit made in the bark of the tree that is to be the host. This is then tied down, and in a single season a branch six feet long may grow from a bud. By carrying out these methods, Luther Burbank produced 20,000 prune-plants in a single season. He raised almond-plants from seeds, and then grafted prune scions on to them with most satisfactory results.

One of the most surprising features of the Santa Rosa and Sebastopol orchards is the great variety of fruits that may be seen growing on a single tree. A hundred is quite a common number, and in some cases as many as a thousand different varieties grow on one and the same tree, all produced by grafting, budding, and cross-pollenating. The idea is, of course, not new; it is practised a good deal in this country, though not on anything like the scale of Luther Burbank. The saving in space is enormous. For instance, on a single acre Burbank often ripens several thousands of varieties of seedling-fruits that, if tested on separate trees, would need six or seven hundred acres. Nowhere, in fact, are there such amazing acres as those of the plant-wizard in California.

Even by selection alone Burbank has completely changed the colours of flowers and the characteristics of fruits. The yellow Californian poppy, for example, has been changed into the brilliant crimson 'Fireflame' merely by choosing in the first place the seed of a plant that bore a yellow poppy with a thin red line, and then, generation after generation, growing the seed of those plants that had this red line more and more accentuated. At last the yellow colour disappeared altogether and the flower was completely crimson; a new variety of poppy had been created. In the same way the scented dahlia, calla, petunia, and verbena were produced.

Plants with abnormal rapidity of growth are developed by these means, as in the case of the chestnut previously referred to, and with trees the greatest care is taken that the timber will not suffer as a result of the quick growth. This is a matter to which Luther Burbank has devoted much time and attention, and when one realises the enormous advantage which would accrue to the afforestation of devastated areas by a speeding up of growth, it must be acknowledged that the subject is a fascinating one. If the hundred years or so which a tree like the oak takes to come to maturity could be halved, the advantage to the community would be very great.

Burbank's work is regarded as so important and of such permanent value in America that a Luther Burbank Society has been formed, and an account of his life and work has been published in twelve volumes, illustrated by 1260 plates of his most beautiful creations, reproduced in colour from original *lumière* plates. It is probably the most remarkable record of a man's life-work ever published, and certainly no such series of colour-plates has ever before been issued. As already mentioned, his birthday, the 9th of March, is specially set aside by the Californian State Legislature as an annual holiday for school-children, and is known as Burbank Day.

How great is the amount of work the plant-wizard gets through is shown by the fact that at one time he was experimenting with as many as 300,000 distinct varieties of the plum, 60,000 peaches and nectarines, 6000 almonds, 5000 chestnuts, 5000 walnuts, 3000 apples, 2000 pears, 2000 cherries, 1000 grapes, and 6000 berries of various kinds. In a single season over 100,000 grafts have been set, and from these have been obtained, also in one season, material for ten million additional grafts.

Perhaps the highest testimony to the plant-wizard's worth, one that can be fully trusted, is that of the famous Dutch botanist De Vries, who says: 'He has already accomplished in his chosen line of life more than any other man who has ever lived. Indeed, when the full sweep of all his achievements shall finally come into view, it may not be unfair to say that not all the plant-breeders who have preceded or accompanied him have done so much for the world. He has done more in a generation in creating new and useful types of plant-life than Nature, unaided, could have done in a millennium; more, indeed, than Nature, unaided, would ever have accomplished.'

Burbank himself is enthusiastic about the future, and the possibilities of increasing the food-supplies of the world, through the improvements wrought by plant-breeding. 'The vast possibilities of plant-breeding,' he says, 'can hardly be estimated. It would not be difficult for one man to breed a new rye, wheat, barley, oats, or rice which would produce one grain more to each head, or a corn which would pro-

duce an extra kernel to each ear, another potato to each plant, or an apple, plum, orange, or nut to each tree. What would be the result? In five years only in the United States alone the inexhaustible forces of Nature would produce annually, without effort and without cost, 15,000,000 extra bushels of wheat, 5,200,000 extra bushels of maize, 20,000,000 extra bushels of oats, 1,500,000 extra bushels of barley, and 21,000,000 extra bushels of potatoes. But these vast possibilities are not alone for one year, or for our own time or race, but are beneficent legacies for every man, woman, or child who

shall ever inhabit the earth. Science sees better grains, nuts, fruits, and vegetables all in new forms, sizes, colours, and flavours, with more nutrients and less waste, and with every injurious and poisonous quality eliminated, and with power to resist sun, wind, rain, frost, and destructive fungus and insect pests; fruits without stones, seeds, or spines; better fibre, coffee, tea, spices, rubber, oil, paper, and timber-trees, and sugar, starch, colour, and perfume plants. Every one of these and ten thousand more are within the reach of the most ordinary skill in plant-breeding.'

THE 'CAPE ROUTE' IN THE 'SIXTIES.

DURING last year occurred the fiftieth anniversary of the opening of the Suez Canal, with the result of a complete change in our sea traffic with India and the East. The traveller of to-day has but a faint idea of the conditions under which his near ancestors made their comparatively few voyages eastward. Even when the 'overland route' had been established for a quarter of a century, great numbers of passengers were carried *viâ* the Cape of Good Hope. Previous to the completion of the Suez Canal the service *viâ* Marseilles and Egypt was fairly punctual and rapid, but only one line of British steamers was available—the P. and O. In spite of obvious advantages in the matter of speed, and the assurance of arriving at one's destination on, or near, a certain date, the cost, the break of journey at Alexandria, and the intense trying heat of the Red Sea during the greater part of the year deterred many eastward-bound travellers from adopting this route. Before the opening of the railway to Suez the desert journey from Cairo was another drawback. In estimating the number of those using the long sea-route, it must be borne in mind that not only passengers, but large bodies of troops, were thus conveyed. Up to the year 1867, when the large royal naval troopships were commissioned, no troops travelled by the overland route. The only exception to this rule was during the Indian Mutiny, when some regiments urgently required were thus sent.

There are at the present time few people with a personal knowledge of the 'Cape Route,' and it may be of interest, therefore, to compare the conditions of sea-travel in those days with present-day conditions.

The modern third-class passenger, it may be affirmed at the outset, has more real comforts and conveniences than the first-class passenger of old. To illustrate the point, take one of the famous 'Green's' passenger-ships during the years 1860–65. The would-be traveller engaged his passage some months in advance. We will assume that he was married, and was travelling with his

wife and one child. He would be allotted a cabin—which meant four bare wooden walls, more or less odorous of paint. The next process was to arrange with one of the numerous outfitting firms for the erection of sleeping-berths and the provision of bedding. For ordinary passengers there were no baths and no lavatories, sanitary conveniences being fitted in the corner of each cabin. There were, however, two stern cabins with bath, &c., attached in the 'quarter galleries' for the exclusive use of the occupants of those cabins, for which a considerably higher rate of passage-money was demanded. The only means of bathing for other passengers were—for a man, during the washing of the decks; for a woman, a foot-bath of salt-water in the cabin. The daily allowance of fresh-water was two quarts per passenger; the only method of supplementing this meagre quantity was by catching rain-water. These were the conditions in the Indian passenger-ships; in Australian liners they were better.

The term 'saloon' was not used; nor would it have been appropriate. The dining-apartment was (as in the old 'East Indiamen') called the cuddy, the waiters being known as cuddy servants. The cuddy stretched across the whole beam of the ship at the forepart of the poop, and was a bare room with one long table, the seats being ordinary light cane-bottomed chairs. It also contained a piano. There were no sofas or easy-chairs. Large square ports and a glazed skylight gave plenty of light and ventilation. The meal-hours (following the custom of the old 'East Indiamen') would appear strange to the present generation—breakfast, 8.30; luncheon at noon, consisting of bread and cheese, and tinned provisions, with bottled beer *ad lib.*; dinner at 3.30; tea at 6.30; and at 8.30 ham sandwiches, biscuits, and cheese, with hot or cold brandy-and-water. Up to 1868 wine and beer were free at meals, champagne being served at dinner on Thursdays and Sundays. There was no smoking-room, and in stormy weather smoking on deck was difficult. All lights in cabins were extinguished at 10 P.M.; the illumination was by candles in swing-

ing holders with glass shades. The cuddy was lighted by swinging argand lamps burning colza-oil. The food, although simple, was in many respects equal (and in some respects superior) to that in the present liners, as large quantities of live-stock were carried. These were in the charge of a butcher and his assistant, the latter being known as 'Jimmy Ducks.' A cow was also carried, that animal being bracketed in the sailing advertisements with 'an experienced surgeon.'

The rates of passage-money per adult ranged from £65 in the between-decks to £120 in the stern cabins. When it is considered that these rates provided board and lodging for a period which extended to seldom less than three and a half months, and sometimes to nearly five months, they were not excessive; but, as a 'set-off,' the passenger not only furnished his own cabin, or portion thereof, but supplied his own linen, sheets, towels, &c. In the later ships of the company, notably in the Australian trade, there was a change in this respect; but up to the end of the 'sixties these conditions generally prevailed.

There were no libraries or amusements, and according to present ideas life was very monotonous. Nevertheless, the daily routine of a sailing-ship was more interesting than that of a steamer. The frequent changes of climate, with interludes of fine, calm, and stormy weather; the 'trimming' of the sails to suit the changes of wind; and the reducing of sail in squalls and gales of wind, served as mild distractions. To some passengers the freedom from letters and the absolute change of life for a long period—in fact, complete rest in pure air—were a boon and a tonic.

In the present day it is not unusual to hear persons commiserating the lot of their forebears in having to undergo the perils of those long voyages in small sailing-ships. Yet records will show that the loss of life among passengers in the vessels of Messrs Green, and probably in those of contemporary lines, was almost a negligible quantity.

The writer can recall only one instance of a total loss at sea in the history of the company. This loss is merely a matter of hearsay. A frigate-built vessel named the *Madagascar* is supposed to have collided with an iceberg off Cape Horn when homeward bound from Australia, leaving no trace. The only other losses which have come to the writer's notice were those of the *Childers*, wrecked in the China seas, and of the *Result*, burnt in harbour at Melbourne. In neither of these cases, it is believed, was there loss of life.

The ships were well built and well found, and carried, even for those days, very large crews; they held the same position in the passenger trade to the East as is now held by the Peninsular and Oriental Company. This famous line (Green's) came into existence on the breaking-up of the monopoly of the East India Company. At first the firm was organised as Green & Wig-

ram; but after a few years the partnership was dissolved. Messrs Wigram then carried on a passenger service to Australia alone.

The earlier vessels of the company were purchased from the East India Company, and the rules and discipline of the old 'Indiamen' were continued. From 1850 to 1870 the fleet consisted of some forty vessels, of which about twenty remained at the latter date. They were all wooden and composite vessels. In 1867 the first iron sailing-ship of the company, the *Superb*, was launched, followed at short intervals by two others, the *Carlisle Castle* and the *Melbourne*. In 1871 an iron steamer, the *Viceroy*, was added to the fleet; and in 1872 another, the *Sultan*.

Many of the earlier ships of the company were frigate-built; that is, they had a complete gun-deck under the upper deck, and another complete deck under that. The other vessels had poops and raised forecastles. With few exceptions, they were moderately fast sailers. Though none could vie in speed with famous clippers like the *Thermopylae*, there were ships—such as the *Renown*, for example—which could attain a speed of fifteen knots. An abstract of the 'log' of the *Renown* seen by the writer shows that she once covered 369 nautical miles in twenty-four hours.

The majority of the ships were capable of a speed of from twelve to thirteen knots. One vessel, the *Almrick Castle*, was credited with a record passage to Calcutta—namely, from Start Point to the Sand Heads at the mouth of the Hooghly—in sixty-five days. The writer has made the voyage from Sand Heads to Spithead in eighty-four days in a sister-ship, the *Newcastle*. Another fast ship was the *Result*, burnt in Melbourne while lying at Sandridge Pier. To this vessel a history is attached; but there are no accessible records by which to verify the tale. It was a commonly accepted tradition in the company that an American owner of clipper ships matched one of his vessels against Messrs Green's *Challenger*, the conditions of the race being that the losing vessel became the property of the owner of the winner. The American vessel was said to have been named *The Challenge*. Messrs Green's ship won, and the winners altered the name of the prize to *Result*.

The first iron ship, the *Superb*, had a long career. After some ten years as a passenger-ship in the Australian trade, she appears to have changed ownership. In 1895 the writer saw her loading in Sydney Harbour, apparently under Australian ownership; and in 1917 or 1918 she ended her career under the Norwegian flag, being torpedoed in the North Sea. It is possible that, with the development of the internal-combustion engine, sailing-ships with auxiliary power may again be employed in the Australian passenger trade; but there will never again be passenger sailing-ships with the prestige of Green's, Wigram's, Dunbar's, and T. W. Smith's, all offshoots of the East India Company.

Chambers's Journal

SEVENTH SERIES

FIFINE'S PROBATIONER.

By Sir GEORGE DOUGLAS, Bart.

PART I.

I.

FIFINE was seventeen, an only child and fatherless. Her mother belonged to that class of widows about whom it is safe to bet that they will not remarry. Yet was she pleasant to look upon, gentle in her ways, and not much past forty. When the Reverend Stephen Laurillard died, leaving her in circumstances that called for prudent management, she had removed from his inland Yorkshire parish to Scarborough, and there devoted herself heart and soul to the bringing-up of her child. So genuinely nice a woman could not long remain friendless, and by degrees she gathered round her quite a pleasant little circle of acquaintances. The Church was her mainstay; for, as became a clergyman's relict, she was a devout churchwoman, 'well seen,' as the French say, by awe-inspiring dignitaries inhabiting the Close at York. And it was observed that when the bishop came to Scarborough to hold a confirmation, he would generally find time to call on 'poor Laurillard's widow.'

Well, now, for almost the first time in her life, Josephine—that is, Fifine—Laurillard was costing her mother tears. What had happened? Something very dreadful? You shall judge.

A few months before, Fifine had made the acquaintance of Montague Jerwood, the twenty-year-old son of a well-to-do solicitor carrying on business in the town, and himself being trained to that business. Though level-headed enough as a rule, the boy had simply gone crazy over Fifine. And, if you ask my opinion, I should say that there was something to go crazy about. 'Goethe's Mignon with a dash of the Nelly Farren of old days; wistfulness and piquancy'—that was the analysis of her opening charms made by the witty London journalist who, throughout so many successive years, was a familiar figure on the Spa. And he had seen enough of life to give his verdict some authority. Not that Fifine was universally admired, for there were those who called her hair red, her complexion colourless, and her eyes gooseberry, and, so doing, thought they had demolished her. But whether it was beauty, or mere *beauté du diable*, or personality (which is perhaps at once the wisest and the most dangerous thing to fall in love with), Fifine

Laurillard was too much for Monty Jerwood, so that the poor lad lost his sleep and his appetite, his grave good sense in the office and his pleasant light-heartedness in society; and the upshot of it all was that, he being an only son, it was decided, after infinite consultation in the Jerwood household, that, on the day when he should attain his majority, he should write to ask Mrs Laurillard's permission to propose to her daughter. That day had now come, that letter had been written and received, and hence Mrs Laurillard's tears.

II.

In the fact that a well-to-do young man of excellent character had proposed for the hand of her daughter, a more 'modern,' or (shall I say?) more reasonable, person would have seen no ground for weeping. If the proposal were importunate, such a person would have said, it could always be refused, and *there* would be an end of it. But Lucy Laurillard was not 'modern,' was rather womanly than reasonable, and such a complexity of tender associations was involved that she could not keep from crying. Perhaps the measure of her unreasonableness is best conveyed by the fact that she cried all the more because the letter was such a nice one! Whilst, on the other hand, the most plausible excuse for these futile tears was Fifine's extreme youth.

Further to complicate the situation, the loving little woman had a reason of her own for returning a very prompt reply to young Jerwood's letter, and that reason was as follows. Fifine was blessed with an aunt, Miss Martindale Laurillard, who, as it happened, was expected to arrive upon a visit to her sister-in-law and her niece on the very day when the fateful letter had come to hand. Now, Lucy Laurillard was extremely anxious to get the all-important question of the proposal disposed of before her stately guest should cross the threshold of the little house on Oliver's Mount. For, 'churchy' and 'well seen' by bishops though she was, Lucy remained very human (it was her crowning grace), and she had but too good reason to fear that, once Miss Martindale was in the house, the affair would be to a great extent taken out of her own hands. Martindale's policy had, indeed, always been to play off her influence with Fifine against that of

the mother. And though Ffine was in her way an affectionate daughter, as giver of feasts and costly gifts Miss Laurillard had certain advantages over the blameless little lady whose occasional duty it was to reprove, and whose almost daily duty to enjoin economy.

Miss Laurillard liked to have secrets with her niece, and to make rather provoking reference to them in Lucy's presence. Sometimes this would be carried to a point which would make Ffine feel sorry for her mother, when she would say, 'Let's tell mummy now, Aunt Bobo, shall we? We've kept her in the dark no end of a time!'

To which 'Aunt Bobo' would reply with firmness, 'No, Ffine, you are not to—I forbid it! I don't want your mother to know that.'

This in Lucy's presence, if you please!

And did Ffine ask for an explanation afterwards, when they were by themselves, she would add, 'Well, you know, my dear Ffine, that your dear mother is not the most tactful person in creation, and that she has positively no knowledge of the world.'

Young Ffine sometimes tried to realise for herself the precise nature of these qualities of 'tact' and 'knowledge of the world,' of which, so far as the family was concerned, her aunt claimed a monopoly. Things difficult of attainment they must be, and vouchsafed only to the few.

III.

Monty Jerwood's letter had arrived by the midday post, and three-quarters of an hour later Mrs Laurillard was endeavouring to sound Ffine as to the precise nature of her feelings for the budding solicitor. She set to work, however, with such excessive delicacy and reserve that Ffine, inexperienced as she was, obtained no very clear notion as to what she was driving at.

'You do like him, my Fifinette?'

'Rather.'

'I'm glad of that,' returned the mother sorrowfully. 'But tell me, do you say "rather" in the sense of rather liking him, or in the sense of, "I should just say I do like him"?''

'Just whichever you like, mummy dear,' replied the daughter, beginning to be bored.

Mrs Laurillard was baffled, but continued: 'Now, I wonder, Fifi, if he has ever said anything very particular to you?'

Ffine merely nodded in reply.

'Oh, my darling! You know that you and I have never willingly had secrets from one another—have we?—and I hope we never shall. What did he say?'

'Well, he did tell me not to say anything about it in the meantime.'

'Yes?'

'But it really can't matter. His people are giving him a Ford car as a coming-of-age present, and I am to use it as if it were my own.'

Needless to say, this was not exactly the sort of thing the good lady had had in mind when she spoke of something 'very particular.'

Ffine's words seemed, however, to confirm an assurance contained in young Jerwood's letter, to the effect that, up to the present, he had addressed no word of love-making to his beloved. What a strictly honourable young man he was! Mrs Laurillard liked him much; yet she much objected to losing her daughter. What should she do? Foiled in her first endeavour, she determined to try again, upon different lines, and with this object in view wrote an emotional note to young Jerwood, giving him permission to speak for himself to Ffine, and, by way of supplying him with an opportunity, asking him to tea that afternoon. By this means she hoped to evade all responsibility of spoiling any one's happiness. And as Monty was to come at four-thirty, one way or the other, all would be safely over before the arrival of the interfering Miss Martindale, who was not expected until six.

IV.

But, like many another well-laid scheme of mouse and man, this scheme of the cleric's widow went 'a-gley.' For, instead of coming by the six o'clock train, Miss Martindale arrived at two o'clock, having been obligingly motored from Ravenscaur by a fellow-visitor in the hotel. This was disconcerting, for circumstances now made it absolutely imperative that she should be taken into her sister-in-law's confidence, whilst, no matter what might have been arranged, it was all but certain that, from sheer jealousy or love of domination, she would do her utmost to upset the arrangement.

And so, indeed, it happened. The bustle of Miss Laurillard's arrival over, and Ffine having been got out of the room, Lucy Laurillard told her tale, and found her misgivings more than realised.

'But, my dearest Lucy, you never mean to tell me that you have authorised this young fellow to pay his addresses to that child!'

'Fifi will be eighteen next month, Martindale,' replied Lucy with gentle deprecation, 'and you know that you yourself always wished that she should marry early. I have often heard you say that.'

'My goodness, Lucy, you would try the patience of a saint, you have such a faculty for misunderstanding the plainest sense! Very naturally it was my wish that any one so dear to me as Ffine should be made happy early. But surely, surely, you have wit enough to understand that that takes for granted that a suitable match has presented itself. Do you ever remember hearing me say that I wished my darling to marry the first comer?'

There was sarcasm as well as irritation in the speaker's tone of voice, which goaded Lucy into

showing more spirit. 'She is my darling quite as much as yours, Martindale,' she replied, speaking in accents which were suggestive of an indignant lamb; 'nor is Mr Jerwood the first comer—I've already told you that. He is a youth of excellent principles, a sound churchman'—

'Churchman be bothered!' exclaimed Martindale. 'By your own showing he's an attorney's son.'

Here Lucy cowered, well knowing what was coming next.

'I suppose you have forgotten that we—or, at least, she and I—are Laurillards of Laurillard?'

It was the old story—pride of birth manifesting itself in the wrong way. It was true that Laurillard Park had been sold, to pay racing debts, long before the Reverend Stephen was born; but it still served the sorry purpose of reminding poor Lucy that he had married out of his own sphere, and that she had been a mere Miss Davidson! And the worst of it was that it served this purpose all too well. Lucy sat speechless. Mounted on her high horse, the other pursued her advantage.

'With *her* ancestry, my dear Fifine is a suitable match for a peer.'

Poor Lucy then was fain to plead the nakedness of the land. 'We know so few peers, Martindale—none, I believe, except spiritual peers. And though that would be a most distinguished honour, it might not be altogether suitable, seeing that Fifi is so very young and not yet quite weaned from levity. Besides, they are all of them married already.'

Here Martindale's impatience betrayed her into language most incongruous in a woman of her professions. 'Fiddlestick!' she cried. 'You surely don't suppose I mean one of your stuffy old bishops? I mean a proper peer—a peer by birth. And let me impress upon you, Lucy, that, pedigree for pedigree, there are plenty of peers who take second place to a Laurillard of Laurillard!'

There was a good deal more of this sort of thing, which I mercifully spare the reader. Briefly, the upshot of the discussion was as follows. Lucy, who could be firm about a few things, simply declined to retract her word, pledged to young Jerwood, to allow him to speak to her daughter on the subject nearest his heart. Fifine's reception of his declaration remained an unknown quantity, and, so far, the situation was as it had been before. But Miss Martindale Laurillard was nothing if not resourceful, and here she cut in to modify it, and make her influence tell. For she insisted that, supposing Fifine favourable to Jerwood, she should accept him, not as an intended husband, but merely as a 'probationer,' to be kept dangling on approval for six months. To this arrangement Lucy was wearied into agreeing, whilst the well-known state of Jerwood's feelings was guarantee that he would not reject it.

V.

In Fifine Laurillard love was still dormant. Among her acquaintances of the other sex, however, she preferred Monty Jerwood. He had always been so nice to her. And so, when poor love-sick Monty urged her to admit him to the position of a probationer for her favour, she answered, 'Very well!' or 'Oh, very well, if you like!' This was not exactly, or was not all, that Monty had hoped for. But he was such an unassuming young fellow, and so far gone in love, that he was able to content himself with it, as being perhaps as much as he had any right to expect. And so his probationary period was inaugurated.

To be an experienced lover seems to me almost a contradiction in terms, and certainly Montague Jerwood was anything but that. Still, he was clear-sighted enough to see that his cue was to 'make the running,' and henceforward joy-rides became the order of the day, or, rather, of the week-end (for he still stuck closely to his work on five days out of seven); and thus his little gray car got to be well known on the Filey and Whitby roads, at Hedmondswyck, Forge Valley, and Hackness. And in that little car, on these occasions, there was always to be seen, involved in her motor draperies like beauty in a cloud, the fair Fifine. For, undemonstrative though she was, Fifine took quite kindly to these drives. On the other hand, it was not often that she occupied the box-seat next the driver, for that was a privilege claimed, in right of seniority, by Miss Martindale Laurillard, whose tall and well-set-up figure towered above Jerwood's, as she surveyed the moving landscape and criticised his somewhat amateurish driving.

Being a martyr to hay-fever, Mrs Laurillard generally kept the house warm during these outings.

'Well, dears, how have you enjoyed your drive?' the good lady chanced to ask, one evening, when Jerwood, having dropped the two Misses Laurillard at their door, was driving off.

'Oh, I don't know,' replied Miss Martindale coldly, as she laid her veil aside; 'that car is certainly the shakiest I have ever sat in! Yet it mayn't be wholly the car's fault, for, between ourselves, Monty is no driver.' (By his own request, the two elder ladies had taken to calling him Monty.)

Fifine heard, and said nothing. *She* had enjoyed her drive, but it now occurred to her that she might have been wrong in doing so. (For, above all things, your flapper recoils from the imputation of enjoying everything indiscriminately.)

VI.

Another day, at a cricket-match, where they had met some friends, Monty happened to hear a matron inquire of Miss Laurillard if her niece was engaged to Mr Jerwood.

'Oh dear, no!' was the somewhat flippant answer; 'not engaged to her—he is only a probationer, and that, you know, is a very different thing!'

In this case the speaker's tone said more than her words did, and it hurt our poor fond Monty rather badly. Not that he was in any way morbid, or given up to introspection; still, it did at times occur to him that his position as probationer was not a very dignified one. No other youth that he knew of had been called on to submit to it, all his friends who had been accepted by girls having been accepted right away, and having entered forthwith into the enjoyment of a lover's privileges. Why should *he* be made an exception of? His estimate of his own merits was modest in the extreme. But that Ffine's relatives should so whole-heartedly (though tacitly) endorse that estimate was galling to his self-respect. And he knew that his people liked it even less than he did. Should he take his pride in both hands, confront Mrs Laurillard, and address her in a speech beginning, 'If you don't think me good enough to be your daughter's accepted suitor'?—Time and again he felt spurred on to do so, but his great dread of losing that dearest of all girls deterred him. After all, probationership (wretched makeshift though it was) was always something to the good. And, in judging him, please remember that what might have been rather despicable in an older man was excusable in a lad of twenty-one, and a home-bred lad at that. After all, it was only Miss Martindale who had ever made him feel his position. And, of course, it was a great piece of condescension on the part of a Laurillard even to think of allying herself with a family that bore no arms! Aunt Martindale had rubbed that well into him. But, for himself, he would have been just as well pleased if Ffine (being always Ffine) had sprung of some less lofty race.

'After all, what have they got to show for it?' exclaimed Jerwood *père*, who was nothing if not practical.

But now it was Monty who was up in arms. 'Shut up, dad,' he retorted defiantly; 'they claim descent from Edward the Fourth!'—as if there was no getting beyond that.

'From Edward the Fourth! Well, hadn't he rather more descendants than he ought? For my part, I prefer to do a rattling good business under Edward the Seventh.' And Jerwood senior settled down to his papers.

It is vexing when one's relatives show themselves so obtuse in comprehension and so limited in outlook as that! Ah, if only Ffine would have declared herself with no uncertain voice! That would have solved the difficulty. But, child-like, Ffine lived in the present hour—contented, sweetness personified, almost too beautiful, but apparently innocent of all inclination to look ahead or below the surface. So, to the much-tried junior Jerwood, no better course presented itself than to study to be patient. After all, Ffine was worth it. And, by way of tuning himself to the proper key, he re-read the touching old story of Jacob's twice seven years' service for his Rachel.

The more he studied to be patient, however, the more the demands on his patience made by Miss Martindale. Had she deliberately set herself to lower him in her niece's eyes? Kind-hearted Mrs Laurillard would at times stand up for him, but Ffine remained impassive, tantalisingly unconcerned, and allowed things to take their course. It was in this way that the whole of one of Monty's precious Saturday afternoons was wasted in going to and fro, trying to match Miss Martindale's wools. Naturally he had wished Ffine to go with him, but Aunt Bobo had answered for her that Ffine did not care for walking for walking's sake! For walking's sake! That little phrase had cut the too sensitive boy. But Ffine had let it pass.

There was one person at least in Scarborough who thought Miss Martindale's visit interminable. That lady, however, showed no sign of drawing it to a close.

(Continued on page 261.)

MEMORIES OF THE FIRTH OF FORTH.

Yonder the shores of Fife you saw;
Here Preston-Bay and Berwick Law;
And, broad between them roll'd,
The gallant Firth the eye might note,
Whose islands on its bosom float,
Like emeralds chased in gold.

HOW manifold are the scenes and memories associated with the Firth of Forth! Many volumes would not exhaust them, and here we can but indicate some features in the story of this important estuary, which has been a background and a theatre for the working out of many great events in Scottish history. Alexander III. met his death in 1286 between Burntisland and

Kinghorn, by his horse stumbling in the dark, some think, not at the top of the cliffs, but at their base. The Forth's associations with Queen Mary, from the time she landed at Leith from France till her imprisonment at and escape from Lochleven, are many and varied. The Reformation struggle was fought out mainly around the Forth basin. The Forth has seen the incursions of the Danes, of the English under the Earl of Somerset and Cromwell; the wars of Independence—Wallace and Stirling Bridge, Bruce and Bannockburn; the battles of Pinkie, Dunbar, and Prestonpans; and many a lesser fight.

Above and below the Forth Bridge, which has conquered the old discomforts of the ferries, might be seen in war-time the great armada of gray battleships and cruisers. Rosyth dockyard and naval base lends fresh and unique importance to the Forth, which will go down in history, too, as the scene of the shepherding of the surrendered German Fleet.

One of our Scottish kings likened Fife to a beggar's mantle fringed with gold. Scott, in *Rob Roy*, calls the Forth a defensible line between Highlands and Lowlands; and his creation, Bailie Nicol Jarvie, declared 'Forth bridles the wild Highlandman.' The old rhyme says:

A crook o' the Forth
Is worth an earldom in the north.

The Forth is not a river Clyde with the far-flung commerce of a city with over a million inhabitants, but there are trade and industry in its basin (and a prospect of more), as witness what is done at Leith, Burntisland, Granton, and Grangemouth. The period of national reconstruction now begun is bound to tell on the Forth basin as elsewhere.

In that wonderful twenty-eighth chapter of *Rob Roy*, when Osbaldistone and Bailie Jarvie approach the river near the clachan of Aberfoyle, the Bailie remarks, 'That's the Forth,' with an 'air of reverence, which, I have observed, the Scotch usually pay to their distinguished rivers. The Clyde, the Tweed, the Forth, the Spey, are usually named by those who dwell on their banks with a sort of respect and pride, and I have known duels occasioned by any word of disparagement.' Andrew Fairservice, however, was in no wise impressed by the Bailie's solemn announcement 'That's the Forth,' which he greeted with an 'Umph!—an he had said that's the public-house it wad hae been mair to the purpose.'

From its rise to the east of Ben Lomond the Forth, formed by the confluence of Duchray Water and the Avonduh, passes through the defile of Aberfoyle, winds across the plain of the Flanders Moss, and loiters through the contracted part of its valley between Stirling and Bridge of Allan towards its estuary. Sir Archibald Geikie points out that its upper course is not only not in accordance with, but actually in defiance of, geological structure. He thinks that in cutting and widening a gap for itself, the Forth may have had much help from the sea. The level valley is a sea-bottom, and sea-shells are dug up there. A depression of ten feet would send the tide up the valley for eighteen miles, 'and if the land were sunk very little more, the firths of Clyde and Forth would meet, and a set of vexed tides would ebb and flow across the centre of Scotland. Such has doubtless often been the condition of the country in the geological past.' The Forth and Clyde Canal does make a modern waterway between

east and west, while the advisability of constructing a ship-canal has been urged from time to time.

Doubtless that would be reckoned a big day in the annals of Scotland when the *Great Michael* was launched in the time of James IV. She was one of the largest ships of war then known, and had exhausted the timber resources of Fife, though her length was only 240 feet. She had thirty-five guns, and 300 smaller artillery of the period. After Flodden, a not very brilliant history was closed for her when she was taken over by the French Government. Daniel Defoe, the greatest journalist and publicist of his day, while acting as an English secret agent in Scotland in 1710, made suggestions how Scotland could be pacified, her trade improved, and unemployment checked. Among his proposals was the erection of a yard, with docks, for building, fitting, and repairing ships, as at Plymouth and Portsmouth. 'Nature,' he said, 'has already made a wet dock of the Forth itself above the Queen's Ferry, and there can be none made like it.' The channel was safe, the ground good, and land-locked from storms. This project was to take shape 200 years later under the stimulus of the German menace. Queen Victoria wrote to Sir Charles Wood in 1855 regarding the need of a dockyard out of the Channel, other than Pembroke, and suggesting the policy of adding an establishment in the Firth of Forth. Such a measure, she thought, would be popular in Scotland, 'and by making the Queen's Navy known there, which it hardly is at present, would open a new field for recruiting for our marine.'

Some of the earliest experiments which led up to successful steam navigation were made on the Firth of Forth. Before Patrick Miller's experiment on Dalswinton Loch, a trial had been made here on 2nd June 1787 with a twin-hulled vessel, with paddles between worked by the crew. James Taylor, tutor in Miller's family, who was on board, seeing the exhausted state of the men at the capstan, is said to have suggested the employment of steam-power. Miller took up the idea, and employed William Symington, a young Wanlockhead engineer, then exhibiting a road locomotive in Edinburgh, to make the engine. So came about the successful experiment on Dalswinton Loch on 14th October 1788. After another trial under the superintendence of Symington on the Forth and Clyde Canal in 1789, when a vessel drawing a heavy load attained a speed of seven miles an hour, Miller, who had spent some £30,000 in this and other experiments, turned his attention to agriculture. Symington's next patron was Lord Dundas, and the *Charlotte Dundas*, in March 1802, made a trial-trip on the Forth and Clyde Canal, drawing two barges with a load of seventy tons for a distance of nearly twenty miles against a strong head-wind. It is believed that both Robert Fulton, who launched the *Clermont*, the

pioneer American steamboat, on the Hudson River in 1807, and Henry Bell, of the Clyde *Comet* (1812), benefited by a sight of Symington's experimental boat while it was lying in the Forth and Clyde Canal. Symington besides devised a new method of propulsion for the ferry-boat between Leith and Kinghorn which never materialised. We have seen his plans (1814) of a boat with rectangular sliding sculling oars to be moved by a steam-engine. These in effect were rear paddles. Symington is credited by Professor Beare with having devised the first steamboat for practical use. He employed a piston-rod, guided by rollers in a straight path, attached by a connecting-rod to a crank fixed directly to the paddle-wheel shaft, 'thus devising the system of working the paddle-wheel shaft which has been used ever since that date.' There was a curious outcome of the present of a model of one of the pioneer boats sent by Miller of Dalswinton to the King of Sweden. The king reciprocated by sending his miniature set in diamonds and a gold snuff-box containing some seeds of turnips which became progenitors of our Swedes.

The adventures and misadventures of the Firth passage in the days long ere the Forth Bridge was dreamt of may be better realised by a few instances we give here.

Charles I., when returning from Falkland on 10th July 1633, in crossing from Burntisland to Leith, nearly met with disaster. A violent storm swept the Firth, which rose and fell within half-an-hour. The king's vessel weathered the gale, but a boat with eight of his attendants, and a quantity of royal plate and money, was lost. Does this treasure still lie at the bottom of the Firth? Unrecorded tragedies 'half ower, half ower to Aberdour,' and elsewhere in the Forth, oft left maids and men lamenting. From the time of the saintly Queen Margaret, who gave her name to Queensferry and her dust to Dunfermline Abbey, many royal persons have crossed and recrossed. Scott makes singularly little in the *Abbot* of the difficulties Queen Mary and her retinue would experience in the crossing, after her escape from Lochleven, ere she gained the shelter of Niddrie Castle on the Lothian shore. Doubtless his mind was preoccupied in developing the psychology of the situation with Seyton, Douglas, and the Abbot. He voices the glad feelings of the imprisoned queen thus: 'No fish ever shot through the water, no bird through the air, with the hurried feeling of liberty and rapture with which I sweep through this night wind and over these wolds.' But there is an inimitable first chapter in the *Antiquary* descriptive of the Hawes fly coach between Edinburgh and Queensferry, which was late, and threatened to cause the intending passenger to tarry a day at the South Ferry for lack of tide. The hire of a special pinnace might cost five shillings, and the coach fare had already been three shillings. Readers know how happily

the travellers adapted themselves to circumstances. R. L. Stevenson, in *Kidnapped*, brings Alan Breck and David Balfour to the northern shores of the Firth after their Highland adventures, and on to Limekilns. 'This is a place that sits near in by the waterside, and looks across the Hope to the town of the Queensferry. Smoke went up from both of these, and from other villages and farms upon all hands. The fields were being reaped: two ships lay anchored, and boats were coming and going on the Hope. It was altogether a right pleasant sight to me; and I could not take my fill of gazing at these comfortable, green, cultivated hills, and the busy people both of the field and sea.' A kind-hearted Fife maiden, listening to their tale of distress, got a boat from its moorings and landed them on the other side near Carriden.

The ferry-boat from Pettycur (Kinghorn) started only at certain states of the tide; hence the passenger was often delayed at Kinghorn, to the satisfaction of the innkeeper. Thither, early last century, came young Thomas Guthrie, the afterwards celebrated Scottish preacher, from Forfarshire, in the charge of Mr Simpson, his tutor, bound for Edinburgh University. They had spent the night in Dundee, crossed the Tay in a pinnace, and travelled two or three stages through Fife on the top of the coach. The last ten miles to Pettycur were done on foot for reasons of economy. They intended to spend the night there, and cross the Forth next morning. They had dined at Kirkcaldy an hour before they came thither. Sampling the tea at Pettycur, they were aghast at the charge of one shilling and sixpence each for the little they had eaten there. Young Guthrie thought he was swindled, and, boy-like, wished that he had made a cleaner sweep of the viands, and so had value for his money. They resolved to get away quickly from what seemed a den of thieves, and cross by the 6 P.M. boat, which was an open pinnace. By this time it was wet and stormy. The tutor and Guthrie and one woman were the only passengers. When the boat had been for a short time on the tumbling waves, the boatmen threatened to pitch them overboard unless they paid double or treble the proper fare. The woman, who had a sharp tongue and a determined will, filled the breach. She snapped her fingers at the cowardly threat, and 'with a tongue as loose as theirs, and more mother-wit, answered these fools according to their folly;' and so, in spite of threats, the passage was continued, and they were safely landed at Leith.

The royal yacht *The George* arrived on August 14, 1822, in Leith Roads, in pouring rain, bearing George IV. on his visit to Edinburgh. Sir Walter Scott, as master of ceremonies, had been asked to put off to the king and humbly request him to delay his landing until next day. When the king heard

that Scott was alongside he exclaimed, 'What! Sir Walter Scott? The man in Scotland I most wish to see! Let him come up.' Sir Walter was presented to the king on the quarter-deck, and there followed a presentation to His Majesty on behalf of the ladies of Edinburgh, and a speech as recorded by Lockhart. The latter does not give, however, Scott's apology for the weather when asking the king to postpone his public entry until next day. The weather reminded Scott of an incident when on tour in the west Highlands with part of his family. He had written to the innkeeper at Arrochar for rooms, but on the appointed day it rained, as it was doing that day, ceaselessly. As they drew near their quarters they were met by the innkeeper, who, with bared head, and backing every yard as they advanced, thus addressed the party: 'Gude guide us, Sir Walter! This is just awfu! Siccan a downpour! Was ever the like? I really beg your pardon! I'm sure it's no fault o' mine. I canna think how it should happen to rain this way, just as you, o' a' men of the world, should come to see us. It looks amaist personal. I can only say, for my part, I'm just ashamed o' the weather.' 'And so, sire,' said Sir Walter to the king, 'I do not know that I can improve upon the language of the honest innkeeper. I canna think how it should rain this way, just as your Majesty, of all men in the world, should have condescended to come and see us. I can only say, in the name of my countrymen, I'm just ashamed o' the weather.' The sequel should be told. Scott asked for the king's glass, from which His Majesty had drunk a sample of Highland whisky. This glass Sir Walter put in his coat-pocket as a memento. When he reached 39 Castle Street he found the poet Crabbe there, and saluting him warmly, sat down beside him. In doing so the glass perished in his pocket. Scott screamed aloud from the pain of a considerable wound inflicted by the broken glass! The point of the king's embarkation for the south at the close of this royal visit was Port Edgar, above Queensferry, after a call at Hopetoun House. Queen Victoria and Prince Albert, on the occasion of their first tour in Scotland, landed at Granton on 1st September 1842, and were met by the Duke of Buccleuch, Sir Robert Peel, and others. The *Royal George* yacht having arrived sooner than was expected, the Corporation of Edinburgh was denied the honour that morning of giving them a civic welcome. They drove to Dalkeith, and as guests of the Duke of Buccleuch had for breakfast Scotch porridge and finnan haddocks.

Here is an account of another crossing of the Firth by ferry from Burntisland to Granton, as recorded by the Rev. Julian Charles Young, rector of Ilmington. His journey from St Andrews to Edinburgh occupied five hours, the crossing in the steamer being specially

uncomfortable. A wait of forty minutes at Leuchars junction was rendered less wearisome by his meeting Professor Jowett. There was no comfort on board the Burntisland steamer. Every available space on deck, gangways, and saloon was overcrowded. It was the last day of August 1872, when many holiday-makers would be returning home. Young says that the packing of slaves in a slave-ship, in the middle passage of former days, could hardly have been worse than the manner in which they were wedged, almost welded, together. In a cabin of about forty feet long there were at least 120 people of all grades. 'Some with soaking mackintoshes clinging to their persons; others with saturated plaids; four young women, each with red hair, and each with a green bird-cage on her lap; three promising schoolboys in sparrow-tail jackets, with rabbit-hutches under their arms, and a commissariat of stale cabbage protruding from their pockets; four or five nursing mothers, with babes of tender age and high cheek-bones, muling and puking in their arms; a hirsute, pimpled, whisky-faced Highland clock-maker, with a specimen of his handiwork in his hands, and escorted by an obtrusive liver-coloured pointer, who found it convenient to dry his coat against my trousers.' Young had reached the depths of resignation, and was trying to close his eyes to the nauseous sights, and his nose to noisome smells, when the captain elbowed his way among the throng and warned the passengers against pickpockets. 'Ladies and gentlemen, I am sorry to tell you that we have several pickpockets aboard. They've given us a deal o' trouble lately; for you can't tell some on um from gentlemen. We warn ladies to look sharply after their pockets, their purses, bags, and such-like, and to take particular notice of the people they sit next.' This announcement acted as if a hand-grenade had been thrown among the crowd. Many bolted out of the saloon. Every woman looked askance at her neighbour; the lady of the bird-cage next Mr Young moved away from him, 'and kept on pinning her shawl around her until she was impregnable.'

Other travellers who remember this passage in east wind and fog shiver at the remembrance. The Forth all too often becomes a gully or a conduit to deluge Edinburgh and neighbourhood with winds from the bitter, biting east, with a probable accompaniment of rain, snow, or fog. A gale from the north-east in the Forth has taken effect as far up as Granton, and stones weighing a ton or more have been known to be torn out of a wall and rolled to a distance of thirty feet. Mr H. M. Cadell of Grange, who has written much on the industrial development of the Forth Valley, is of opinion that the mud in the Forth comes up the estuary, being washed in from outside.

Robert Stevenson, of lighthouse fame, grand-

father of R. L. Stevenson, in a privately printed volume, recording a trip to Holland, gives a wonderful word-picture of Edinburgh as seen from the Firth at sunset. Christopher North has a serio-comic picture of the same view seen when the Ettrick Shepherd and himself were splashing in the sea at Portobello. There are atmosphere and local colour in *Islands Chased in Gold*, by the Rev. John Dickson, and John Geddie's *Fringes of Fife*, which gives the story of the towns and villages on the Fife coast. For Kinghorn and Burntisland the beginning of David Pryde's *Pleasant Memories of a*

Busy Life is excellent. For the Lothian side in the eighteenth century nothing is better than 'Jupiter' Carlyle's autobiography. A modern book, *The Gateway of Scotland*, by A. G. Bradley, is good for the Berwickshire and the Lothian coasts. And we come again to Scott for the third time impinging on the Firth in his tragic *Bride of Lammermoor*. In some of the essays in *Across the Plains* by R. L. Stevenson there is a flavour of life on both sides of the Firth. But the special literature is far too abundant to be mentioned here in full.

R. C.

THE PARTS MEN PLAY.

CHAPTER XII.—continued.

II.

IT was nearing the end of a breakfast that had been trying for every one. Lord Durwent's usual kindly affability was overcast by a fresh worry—the non-appearance of his son Malcolm. Four telegrams had been despatched to Scotland, but no answer had come. Elise had been gay and talkative with a forced vivacity; and Lady Durwent had been bordering on hysteria. Not that the dear lady was of sufficient depth to be profoundly moved by the world's tragedy, but her unsatisfied sense of the dramatic gave her a new thrill every time she said, 'WE ARE AT WAR—THINK OF IT!' as if she were afraid that without her reminder they might forget the fact.

Selwyn sat in almost complete silence, merely acknowledging Lady Durwent's proclamations of a state of war by appropriate acquiescence, but his eyes remained fixed on the table. He could not trust them to look at Elise for fear they should prove traitor and sue for an ignoble peace. As for her, she met the situation with a smile, using woman's instinct of protection to assume a cloak behind which her real feelings were concealed.

They had just risen from the table when the sound of a motor-car was heard in the courtyard, and Elise hurried to the window.

'It's Malcolm, dad,' she said.

More in hysteria than ever, Lady Durwent hurried from the room, followed more slowly by her husband and daughter, and greeting the Honourable Malcolm at the door, smothered him in a melodramatic embrace.

'My dear, brave Malcolm,' she cried.

With as good grace as possible the young man submitted to the maternal endearments, disengaging her arms as soon as he decently could.

'Where's the governor?' he asked. 'Ah, there you are. Hello, Elise! I'm frightfully sorry, pater,' he went on, shaking hands with Lord Durwent and patting his sister on the shoulder, 'about those telegrams of yours, but

we were on M'Gregor's yacht miles from nowhere, and didn't even know the dear old war was on until a fishing johnny told us. Are my orders here?'

'Yes,' answered Lord Durwent; 'there are two telegrams for you. One came last night, and one this morning. I will just go into the library and fetch them.'

'But, Malcolm,' said Lady Durwent, 'I want you to meet our guest Mr Selwyn of New York.'

The young Englishman smiled with rather an attractive air of embarrassment. 'I'm frightfully sorry,' he said amiably, proffering his hand, 'I didn't see you there. Have you had any kind of a time? It's rather a bore being inland in the summer, don't you think?'

'I have enjoyed myself very much,' said the American, 'in spite of the tragic end to my visit.'

'Eh,' said the Honourable Malcolm, startled by the seriousness of the other's voice, 'what's that? Ah yes—you mean the war. Excuse me if I look at these, won't you?—Thanks, pater.'

'WE ARE AT WAR—THINK OF IT!' cried Lady Durwent in a gust of emotion, assuming the duties of a Greek chorus while her son examined the telegrams brought by her husband.

'Well, well,' said the cavalry lieutenant, reading the first message, which was signed by the adjutant of his regiment, 'dear old Agitato. How he does love sending out those sweet little things: "Leave cancelled; return at once"! Ah, my word! "Secret and Confidential"—good old War Office. What a rag they'll have now running their pet little regiments all over the world! Humpf! By Jove! we're to move to-morrow. Good work! Let me see, pater. What train can I catch to town? I must throw a few things together'—he looked at his watch—'but I'll be in heaps of time for the 11.50. The Agitato always has a late lunch and never drinks less than three glasses of port, so I'll throw myself on his full stomach and squeal for mercy for

being late. I say, pater, do come up while I toss a few unnecessaries into my case.—That's right, Brown; put my bag in my room. And, Brown, you might put some vaseline on those golf-clubs. I sha'n't be wanting them for some little time.—Come along, pater.—Excuse me, Mr—Mr'—

'SELWYN,' cried Lady Durwent.

'Mr Selwyn, I'll see you later, eh?'

The old nobleman ascended the stairs with his son, and the agreeable chatter of the latter, with its references to 'topping sport' and 'absolutely ripping weather,' came to an end as they disappeared along the western wing of the house. Lady Durwent, wiping her eyes, went into the library, and Selwyn, who was not particularly enamoured of solitude and its attending tyranny of thoughts, followed her.

Elise, who had stood in mute contemplation of her brother, neither addressing a remark nor being addressed, hesitated momentarily, then went into the drawing-room by herself and closed the door.

'Oh, Mr Selwyn,' said Lady Durwent, breathing heavily, 'you have no idea what a mother's feelings are at a time like this.'

'I can only sympathise most sincerely,' said the American gravely.

'He has been such a good boy,' she said vaguely, 'and so devoted to his mother.'

'I can see that, Lady Durwent.'

'I shall never forget,' she went on, her own words creating a deliciously dramatic trembling in her bosom, 'how he wept when his father insisted upon his leaving home for school. It was all I could do to console the child, and when he came home for the holidays he was just my shadow.'

At that satisfactory thought (though Selwyn was a little puzzled at the picture of the diminutive Malcolm serving as a shadow for Lady Durwent's bulk) she expanded into a smile, but immediately corrected the error with a burst of unrestrained grief.

'THINK OF IT, MR SELWYN,' she cried, reversing the formula—'WE ARE AT WAR!'

He murmured assent. 'I am afraid, Lady Durwent,' he said, 'that I must return to London this afternoon.'

'Oh, Mr Selwyn!'

'Yes, I must. I have a great deal of work before me, and only the cordiality of your welcome and the pleasure I have felt in being here would have allowed me to stay so long. You have been wonderfully kind, and perhaps the fact that I was here when war broke out will lend a special significance to our friendship for the future.'

'Oh, I shall never forget you,' murmured his hostess, whose emotions were so near the surface that almost any remark was sufficient to tap them. 'You have been the truest of friends, and Elise is so fond of you.'

'I am very fond of Elise,' blurted Selwyn, feeling his cheeks grow red. 'Her companionship and inspiration were something'—

'Ye-es.' An instinct of caution plugged the emotional channel. Lady Durwent saw that she had been indiscreet. It was not in her plan of things that her daughter should become enamoured of a commoner. Selwyn was all very well for company, and no doubt his books were very good, but Elise Durwent would have to marry in her own station of life.

'You feel that you must go this afternoon?' said the Ironmonger's daughter dismally, but with an inflection that made it more a reminder than a question.

'Yes, Lady Durwent,' he answered, with a cynical smile creeping into his lips, which seemed thin and almost cruel. 'I shall catch the 3.50.'

'Then you must come again and see us sometime, Mr Selwyn,' she said, with that vagueness of date used by polite persons when they don't mean a thing. Lady Durwent rose with great dignity. 'Will you excuse me, Mr Selwyn? I always meet my housekeeper at ten to discuss domestic matters. Elise is somewhere around. Is it too damp for tennis?'

She paused at the door. She had to. It is one of the traditions of the stage that a player must stop at the exit and utter one compelling, terrific sentence.

'WE ARE AT WAR,' she cried—'TH'—

'Think of it!' he said maliciously, bowing and closing the door after her.

III.

Going to his room, Selwyn packed his own bags, dispensing with the services of the valet, and with more than one sigh of regret glanced about at the luxury which he was soon to quit. The great bed with its snowy billows of comfort; the reading-lamp on the little table with the motley collection of books borrowed from the library with the very best intentions—books which had hardly been opened before sleep would obliterate everything from his sight; that merry picture of the two medieval enthusiasts playing chess, and those jolly Dickensian paintings of huntsmen at luncheon with grinning waiters and ubiquitous dogs. What a charm they all had! What a merry little spot England had been in those good old days!

A ray of sunshine stole through the curtains as if it were not quite sure of its welcome, and shyly rested against the farthest wall of the room. With an exclamation of pleasure Selwyn threw open the window and looked out upon the lawns.

The sun had won its battle, and the countryside was cleared of the invading mist, which was ingloriously retreating to its own territory behind the distant hills. There was a sparkle in the air, and the rich colourings of the flowers vied

with each other in Beauty's quarrel. The birds flew from tree to tree, singing their pæan of the sun's victory, and a light summer's breeze was scattering perfume over the earth.

As a sick man emerging from a fever, Selwyn let the refreshing vigour of the morning lave his temples with its potency. Looking towards the stables, he saw Mathews, the groom, come out of his domain to cast an approving glance on Nature's performance. Selwyn decided that he would go and say good-bye to the fellow. There was something both sturdy and picturesque about him, and the American presumed that even the head-groom of the Durwents would not be averse to a ten-shilling gratuity. He therefore left his room, and reaching the lawn, strolled over to the stables.

'Good-morning, Mr Selwyn,' said the groom cheerily, touching his forehead in a semi-nautical greeting.

'Good-day, Mathews. How are all your family this morning?'

'Meaning the hosses, sir, or opposite-like, my old mare and her colt? Likewise and sim'lar, and no disrespeck meant, meaning my old woman and little Wellington.'

'Well,' Selwyn smiled at the worthy man's ramifications, 'I did mean the horses, but I am even more anxious to know how Mrs Mathews is.'

'She's a-blooming, Mr Selwyn, she is. When I sees her t'other night dancing at the village, I says to myself, "Criky! If she ain't got a action like a young filly!" Real proud I was of her, and her being no two-year-old neither, but opposite-wise free of the rheumatiz as is getting into my withers like.'

'And how is—did you say his name was Wellington?'

'That's his handle, Mr Selwyn, conseckens o' his being born with the largest nose I ever sees on a offspring of his age. He's only four year and a little better, but—criky!—if he ain't the knowingest little colt as ever I raised! When my old woman gives him his bath he goes "hiss-ss, hiss-ss," just like a proper groom rubbing down a hoss. But he's a unfeeling wretch, he is, for when I goes home arter feeding-time o' nights, and thinks I'll just smoke a quiet pipe, he up and says, "Lincoln Steeplechase, guv'nor, and I'm a-riding you." And there he has everything around the room—his little table and chairs and toy pianner, and I've got to jump over 'em on my hands and knees with that there vicious scoundrel a-sitting on my neck and yelling, "Come on, you d—d old slow-coach! Wot did I give you them oats for?" Now I puts it to you, Mr Selwyn, if a imp as makes his fayther jump over a toy pianner is the kind o' child as is like to be a comfort to a feller in his old age?'

'With which harrowing query the groom slapped his pipe on his heel and blew violently

through it to try to disguise his gratification at the paternal reminiscence.

'I don't think I've seen all the hosses,' said Selwyn. 'Can you spare a few minutes to show them to me?'

'Wi' all the pleasure in life, sir. Come in, sir. I know it ain't becoming of me for to boast,' said the groom as they entered the building, 'but if there's a better stable o' hosses than them there, then my name ain't Mathews, nor is my Christian names 'William John neither. There ain't many in England as knows a hoss quicker 'an me, Mr Selwyn, though I says it that shouldn't ought to, but I knows a hoss just as soon as I sets eyes upon him. Milord, he's just a small bit better, though likewise and sim'lar we usually thinks exac'ly the same. Only once we disergreed on a hoss. I says it were vicious, and he said as how it weren't. So we bought it.'

'And who was right?'

'Well, sir, I sort of estermate as how he was, for just arter we got him Mas'r Dick, who ain't afraid o' any beast as walks on four legs, took him out for a airing. Well, sir, that hoss—powerful brute he were, with a eye like Sin—goes along like as if he hadn't a evil thought in his head; but all on a sudden he comes to a ditch, and sort of rolls Mas'r Dick into it, and bungs his head against a stone.'

'Then he was vicious, after all?'

'No, sir—that's the extr'ord'nary part of it. He comes right back to the stables to me and pulls up short. I goes up and looks into that there sinful eye. "You hulk o' misery," I says; "you willainous son of a abandoned sire!" You know, sir, I always likes to make a hoss feel real bad by telling him what's what, for they got intelligence. Mr Selwyn, I should say, by criky! a human being ain't in the same stall as a hoss for intelligence.'

'I think you may be right,' said Selwyn decisively.

'May be? There ain't no doubt about it nowise.'

'And what happened to your horse?'

'Ah yes, sir. Well, sir, I gets on him, and pulling his face around by his ear, I give him another look in his sinful eye. "Where's Mas'r Dick?" I says. And—criky!—off he goes, lickerty-split, like as if we was entered for the Derby, and, sure enough, he stops right at the ditch where Mas'r Dick was a-lying all peaceful and muddy like a stiff un. Well, sir, I gets off and lifts him up, and then mounts behind him, and that there hoss he never moved until I tells him, and then he goes home so smooth-like that a old lady could have rid him and done her knitting sim'lar. And arter that he were as gentle as a lamb, he were—and there he is right afore your eyes, Mr Selwyn. He's a old hoss now, and ain't much to look on, but every morning when I comes in he takes a look with that

there bad eye o' hisn and says, just like I says to him that day, "Where's Mas'r Dick?" I sqmetimes feels so sorry for the old feller that I swears something horrible just to cheer him up.'

With considerable interest, though with a certain doubt as to the strict authenticity of the narrative, the American looked at the horse, which, after a melancholy survey of the visitors, vented its grief in an attempt to bite a large-sized slice from the neck of a neighbour.

'Nah, then, you — — —,' remarked Mathews unfeelingly, catching the old beast a resounding thump on the rump with a stick he carried. 'That'll learn you, you old hulk o' misery.'

'There's a beautiful mare,' said the American, pausing at the stall of a superb charger whose graceful limbs and shapely neck spoke of speed and spirit.

'Ah! Now that there is a beauty and no mistake. She's got the spirit of a young pup, but is as amiable and sweet-tempered as a angel. She's Mister Malcolm's hunter, she is, and his favourite in the whole stables. He never rides anything but her to hounds; leastways, he never did but once, and then Nell—that's her name—Nell was took so sick with fretting that she kicked a groom as had come to feed her clean across the floor agin' that there far wall. Never I see a feller so put out as that there groom—never. Well, sir, she wouldn't let no one come nigh her, and just as we was thinking as how we'd have to forcible-feed her, in comes Mister Malcolm. She hears him, but don't

make no sign, and just as he comes up close she lets fling her heels at his head. But he was watching for it, and just says "Nellie" kind o' sorrowful and reproachful, sim'lar to the prodigal son returning to his aged fayther. Well, sir, the mare she just gives in at the knees and rubbed her nose agin' him, and says jest as plain as Scripiter that she was real sorry, and hoped he'd forget it as one gen'lman to a lady.'

With sundry anecdotes of a like nature, Mathews guided the visitor past the long line of stalls, whose inhabitants kept their stately heads turned to gratify the insatiable curiosity of the equine. To the weary mind of the American there was an agreeable balm in the groom's fund of anecdote, and even in the odoriferousness of the stable itself.

Reaching the end of that line, Mathews proposed that before they went any farther they should go to an adjoining shed and inspect a litter of little hounds that were blinking in amazement at their second day's view of the world. From a near-by kennel there was the discordant yelping of a dozen hounds, and between the two places a kitten was performing its toilet with arrogant indifference to the canine threat.

They were just about to retrace their steps, when Selwyn felt Mathews's hand on his arm.

'Sh-sh!' the groom whispered. 'There's Mister Malcolm a-come to say good-bye to Nellie. I knew he would, sir. She'd ha' fretted her heart out if he hadn't.'

THE SPECIAL BRIGADE, ROYAL ENGINEERS,

By J. A. COCHRANE, B.Sc.

I.

DURING the war the daily *communiqués* and the despatches of correspondents gave one only a very slight idea of what was going on in the battle area. And it was necessarily so, partly because everything could not be told, and partly because it was not expedient that some things should be known. Was there ever any mention of the Special Brigade, R.E.? If there was, it was indirect, and referred only to the results of its labours, and not to the methods by which those results were obtained. Even now practically nothing is known generally of its work, not even that it was responsible for most of the poison-gas that arrived in the German trenches. Super-secrecy characterised the use of gas from the time of its introduction into modern warfare. This was obviously very necessary at first in order to preserve the element of surprise, and even at a later stage to prevent our methods becoming known to the enemy; but latterly it hardly seemed necessary

to keep from the British public what was known to the enemy. However, perhaps it was better to err on the safe side.

Every one, whether he took more than a passing interest in the war news or not, was horrified when, towards the end of April 1915, he learned that the Germans had introduced gas as a weapon of war. This method of inflicting casualties had received special mention in the Hague Convention, by which all the signatories agreed that it would henceforth be unlawful to employ it. Notwithstanding this, the Germans, with almost incredible brutality, launched a cloud of poisonous gas against unprotected and unsuspecting troops. Acting in accordance with their usual policy, they prepared the way for it by accusing the Allies of having dropped gas-bombs on the German lines, an accusation in which, I need hardly say, there was not an atom of truth. From shells men can escape by burrowing into the ground (if they burrow deep enough), but gas relentlessly makes its way into every corner, and finds men in even the deepest dug-outs; there is

no escaping it. Any one who has had experience of chlorine in a laboratory knows what it feels like to take one breath of the gas. Can you imagine the fearful agony of those men who were involved in the first gas-attack? Without any warning they suddenly found themselves in a poisonous atmosphere, with no means of protecting themselves from the deadly fumes. The casualties reached an enormous figure, and a gap four miles wide was made in the line. Why the enemy did not follow up his advantage has always been a mystery; he could have gone at least five miles without encountering any formidable opposition.

After this experience respirators of a temporary nature were hurried to the front. These generally consisted of pads, soaked in hypo solution, which covered the nose and the mouth, and were tied behind the head. They afforded partial protection, but it is obvious that they could not stand high concentrations of gas or long exposure to a low concentration. Fortunately in the first two or three gas-attacks the concentration was only about 1 in 200,000, and it was effective only about three miles behind the line, so this hastily improvised respirator could deal with it until the more efficient smoke-helmets were got ready. Several more attacks were made in April and May of that year, after which the German gas companies were withdrawn and sent to the Russian front for the summer, because of the prevalence of westerly winds during that season.

II.

Meanwhile the British were not idle. While the Press was agitating for reprisals, the War Office was busy, and as early as May 1915 arrangements for a new branch of the service were on foot, and recruits called for. Before being enlisted into the Special Companies, R.E., as this new unit was called, men had to produce proof that they had at least an elementary knowledge of chemistry; hence it was thought, with no other information at their disposal, that their chemical knowledge was going to be utilised in a research laboratory or, at least, in some munition-factory. It was not until they were actually in France that they discovered that, far from making these trained men serve any technically useful purpose, it was intended to send them to the front line to discharge gas, an operation more suited for a plumber than a university graduate. It looked very like a trick to rope in a certain class of men, and as such it was greatly resented by the victims. They were secretly hurried out to France; some had not been in khaki three weeks before they found themselves in the front line. Men were also transferred from infantry regiments to form a military nucleus to the new formation, while, it was alleged, the chemists would give confidence in the handling of the gas. By the end

of August the new unit was assembling near St Omer. It was a motley crowd. There were representatives from nearly every regiment in the British Army, besides those specially enlisted for the work in hand. To make matters worse, from the military point of view, every man was given the rank of corporal, the unit thereby incurring the ridicule of regular units, and the title of a 'rag-time mob.'

The first British gas-attack took place at Loos on 25th September 1915, and it was a failure. In the first place, the wind changed slightly in direction during the discharge, and some gas entered our own trenches, which were packed full of men waiting for the moment fixed for the beginning of the infantry advance. In the second place, the apparatus used was clumsy and leaky, which caused endless and serious trouble. In the third place, the men had not had adequate training in the use of this apparatus. In the fourth place, the smoke- (or gas-) helmets that had been issued were too hot to work in; in fact, in many cases they were taken off, with disastrous consequences. Our own gas casualties were many, and it made a bad beginning for that successful but costly battle. Besides, it gave our game away; it showed that we intended to use gas, and so enabled the enemy to make defensive preparations before we came into the field with improved apparatus. However, experience again proved itself to be a great teacher. Many valuable lessons were learned from this failure, and future operations benefited accordingly. During the remainder of 1915 one or two small discharges of gas took place, but I doubt very much if they caused a great deal of annoyance in the trenches opposite.

III.

At the beginning of 1916 the Special Companies were withdrawn from the forward area. They were increased in number from four companies to twenty-one, and were then dignified by the name of the Special Brigade, R.E. They were put through a course of general and technical training to make them more fit physically, and more efficient in their particular calling as 'gassers.' When the companies forming the Brigade again proceeded to advanced billets in June, they did so with much more confidence, because of their better training and better equipment. At Loos cylinders were made to stand in the trench, and there were at most two parapet pipes per twenty cylinders, which meant, of course, that pipes had to be changed from one cylinder to another; after one cylinder was empty, the pipe was disconnected and connected to the next full one. This changing over introduced a good deal of gas into the trench, for there was always a certain amount of gas in the pipes; and it also made for a low concentration, as only a maximum of 10 per cent. of the cylinders could be turned on at one time. But

all this was changed in 1916. Special emplacements were dug in the front line, and boxes made to hold the cylinders. This prevented the trench becoming blocked, and also allowed a protective wall of sand-bags to be built. Then each cylinder had its own pipe, and thus all connections could be made before the discharge commenced.

Instead of pure chlorine, a mixture of chlorine and phosgene was now used. Phosgene, whose chemical formula is COCl_2 , is a more deadly gas than chlorine, but it could not be used alone in cylinders because of its high boiling-point. The chlorine acted as a kind of propellant, forcing the phosgene out of the siphon. Phosgene corrodes the lungs, causing coughing and sickness, and it is strongly lethal. It has a delayed action when inhaled sparingly, attacking the heart twenty-four or even forty-eight hours after exposure to it, without, in the meantime, any bad effects being felt. Hence the order that gas cases were invariably to be treated as stretcher cases.

At the end of June, just before the first battle of the Somme, there was a series of gas-attacks all along the British front, which, as we afterwards learned, were very successful. To give one example, at Nieuport it was discovered that the regiment holding the German line was badly trained in anti-gas discipline; accordingly gas was installed in our front line, and though by a raid the enemy found out that gas-cylinders were there, yet they suffered 1700 casualties, of whom 700 died immediately.

Along with the use of more deadly gas was introduced more adequate protection against enemy gases, in the shape of the Tower respirator, which was the same in principle as the box respirator issued generally a few months later. It consisted essentially of a canister containing three layers of charcoal and soda-lime, through which the wearer had to breathe. Any gas in the atmosphere was absorbed by the charcoal or acted on by the soda-lime, and only air was breathed. It was a tremendous improvement on the smoke-helmet. Let me quote from an official pamphlet in this connection: 'It cannot be too strongly insisted on that the measures that have been elaborated to meet hostile gas-attacks afford *perfect* protection, and, if they are carried out properly, no one will suffer from gas-poisoning.' This was a big claim to make, but it was fully justified. Gas casualties resulted either from individual carelessness or from exceptional circumstances.

IV.

An important change in offensive tactics came in November 1916, just before the attack on Beaumont Hamel. The idea struck an officer of the Special Brigade that if bombs filled with gas could be fired in considerable numbers simultaneously into the enemy's lines a maxi-

mum effect would be produced. In the ordinary 'cloud' method a fair percentage of gas was dissipated in crossing No Man's Land, and unavoidable leaks caused great annoyance, to say the least of it, in our own trenches. From this officer's idea projectors were finally evolved. These were steel tubes, closed at one end. They were dug into the ground in batteries of twenty or twenty-five at an angle of elevation of about forty degrees, and aligned on the target by means of a prismatic compass, the direction having been previously determined from a trench map. A charge of cordite was inserted, and then a bomb. Inside each charge there was an electric fuse, and each fuse was electrically connected by insulated wires to the fuse next to it in the battery. A battery connected up in this way was fired by a small hand-exploder, an instrument which works on the principle of the dynamo, the current being generated by the revolving of an armature between the poles of a magnet. With a blinding flash and a tremendous report, the bombs were sent off on their errand of death. The fuse in the bomb was timed so that it would explode as nearly as possible at the moment it landed, and the bursting charge was such that there was no splinter effect—the bomb merely opened up, allowing the contained gas to escape. In this way one company has fired as many as 2000 bombs at one time. When it is remembered that each bomb contained about thirty pounds of liquid gas (usually phosgene), some idea will be obtained of the density and the extent of the gas-cloud formed on the target. Projectors had a range of from 1100 to 1600 yards, depending on the length of the tube and on the weight of the charge.

This method of gas discharge was very successfully employed preliminary to the battle of Arras in April 1917, when ten companies, distributed along the line from Arras to Vimy Ridge, fired about 1000 bombs each. It was estimated that the casualties inflicted on the enemy in this operation amounted to one per two bombs.

During 1917 gas was discharged in this way, on an average, every alternate night. Many captured German documents went to show the dread the enemy had of these projector shoots. The higher commands issued more and more strict orders regarding anti-gas appliances and discipline, and the artillery were ordered to concentrate on projector positions when they were discovered in order to destroy our '*gas minenwerfers*,' as they called them. There was no doubt about this order being obeyed, as we found to our cost. One night the writer proceeded with his men to his battery position to carry out the usual night's work of preparation, and on arrival found that since the previous night some 400 shells had fallen on or near the batteries, causing great, though not irreparable, havoc. But unfortunately the Boche artillery did not always undertake these destructive

shoots by day when no one was there. One night in front of Lens, when we were making final adjustments prior to firing at 4 A.M., we were interrupted on three separate occasions by concentrated fire on our battery position, and the German gunnery was extraordinarily accurate.

v.

The best proof of the effectiveness of the Special Brigade's projectors came in December 1917, when the enemy tried to imitate our methods by firing salvos of gas-bombs from their medium and heavy trench-mortars. For two reasons, they did not meet with much success. First of all, the bombs contained only about half the quantity of gas that ours did; and, secondly, the number fired simultaneously was much smaller, about fifty being the maximum. About March 1918, however, they began to use some of our projectors which they had captured in the November debacle at Cambrai. Even then, however, their success was limited, because of the excellence of our respirator, and the high standard of anti-gas discipline among the Canadians, against whom most of these attacks were made.

About April 1918, just after the great German offensive had started, there was a shortage of projectors, partly because of the fact that the enemy had captured some 30,000 of them, and partly because the newly formed and newly trained American gas companies were clamouring for material with which to get going. This being the case, the companies of the Special Brigade had to be employed in some other way. During the offensive some of them had their hands quite full. On the Somme three of them held up a hostile advance for four hours; west of Armentières one of them made a counter-attack, and in so doing delayed the advance there for some time. But others, fortunately for themselves, were not engaged in this way. In April a circular letter came from the General Officer Commanding the Special Brigade, announcing that there were about 100,000 cylinders in the country, and companies were not using them. As a matter of fact, companies did not want to use them, for projectors were at the same time less troublesome and, they believed, more effective. On the La Bassée sector, however, about 3000 cylinders were installed, and they were the source of more worry and trouble to everybody concerned than the results could possibly justify. The wind-limits at the particular sector affected were very narrow—W.N.W. to W.S.W.—and it was six weeks before a suitable wind came. Then the enemy discovered that the installation was being made, and naturally he gave that part of the line a warm time. He shelled it; he trench-mortared it; he raided it. He came over at night, tied bundles of hand-grenades to the emplacements, and exploded them by pulling a string. It was a great relief when the cylinders were finally discharged.

vi.

In May a new method was initiated by which thousands of cylinders could be discharged with the minimum amount of risk and labour. Light railway-trucks were fitted with wooden frames, in which a number of cylinders (the number varying according to the type of truck) were fixed firmly in an upright position. On the outlet pipe of each cylinder was fitted a specially prepared spigot which could be burst by a detonator. The detonator employed was an electrical one. All those in one truck were connected by insulated wires in series, and the trucks were connected in parallel. All the preparatory work was done at a railway siding three or four miles behind the line. Then, on a night when the meteorological section forecasted a favourable wind, the whole train, with its load of anything up to 2000 cylinders, was pulled up to a previously appointed position. All that had to be done then was to turn on the cylinder-valves and burst the spigots, the necessary current being supplied either by exploders or by the petrol-electric engine which pulled up the train. Thus the maximum effect was obtained, for the cylinders were all emptied at the same time, producing a very dense cloud which has been known to be effective ten miles behind the front-line system. The transport difficulty was overcome, and, apart from shell-fire, it was the greatest difficulty we had had to contend with. Where there was a light railway near the battery position, it was a comparatively simple matter; but that was seldom the case. Usually all the material had to be man-handled for a considerable distance, and that over shell-torn country or through tortuous and treacherous trenches. Moreover, all operations were carried out at night. When it is stated that the weight of a cylinder was from 160 to 180 pounds, and of a light projector 95 pounds, these facts will be sufficient excuse for the strong expressions of strong views that one heard from carrying-parties. But the new method dispensed with all this. It was extensively employed on the Lens-Arras sector during the summer of 1918.

Of course, it was not quite so simple as it may appear; there were a thousand and one details connected with one of these 'Gas Bean' attacks, as they were called, that entailed careful organisation and a considerable amount of labour. The infantry had to be cleared from the path of the cloud, trucks had to be hauled into position by men in cases where the state of the railway did not allow the engine to take the train to the discharge-point, the railway time-table had to be gone into very carefully to avoid accidents, railway maintenance parties had to be available in case of breakdown or the railway being hit by shell-fire, and a sharp look-out had to be kept on the direction and speed of the wind. The responsibility of the officer in charge of one

of these operations was indeed great—a miscalculation or an error in judgment might have involved the loss of hundreds of lives. Things did not always go smoothly. A slight bulge in the rails on one occasion caused ten trucks to be reduced to matchwood, and a whole train to be left in full view of the enemy for twenty-four hours. In another case the fact that one of the railway switches had not been adjusted properly caused the derailment of six trucks. But one could hardly expect that undertakings so big would pass off without a hitch; the conditions of inky blackness that sometimes prevailed would have upset the most carefully-thought-out schemes.

In the autumn of 1918 these 'Gas Bean' attacks were in full swing at those parts of the line that were then stationary or only moving slowly, in addition to the continued use of projectors, which had become more plentiful. At the beginning of November several companies were sent down to the American front to assist in offensive operations there. This time, instead of gas-bombs, bombs filled with high explosive were to be fired; but when preparations were almost complete the armistice was signed, and, of course, all operations were cancelled.

VII.

One aspect of the work of the Brigade which has not yet been touched on is the simulation of gas-attacks. Occasionally bombs filled with a smoke-mixture were fired, which, when they burst, formed a cloud very similar in appearance to a gas-cloud. As a rule such a shoot was followed by a raid. If it took place by day, the cloud served as a screen by which the raiding-party escaped observation from the flanks; if by night, the characteristic flash and report which the enemy had come to recognise made them don their respirators, and thus gave the raiding-party an initial advantage. Oil was also fired

in bombs (the 'boiling oil' of the war correspondents), but the only effect produced by it was, in army language, to 'put the wind up the Boche.' This was done very effectively at the famous battle of Messines, just before the nineteen mines were fired.

There is not the slightest doubt that the Special Brigade, R.E., fully justified its existence. Considering the relatively small number of men it employed, and the comparatively low cost of the material it used, it was the means of inflicting more casualties on the enemy than any other branch of the service. This is a big statement, but figures, incomplete though they are, bear it out. The Germans had good cause to regret that they introduced this powerful weapon of war, for, after the first year's experience, we gained a decided superiority in its use, and not only maintained but kept increasing that superiority right to the end. Where we gained the advantage was in the matter of concentration. In projector shoots, we could obtain concentration in which no one could live with anything short of an oxygen respirator. The ordinary respirator is effective so far, but the stream of gas through it may become so great that the chemicals in the box cannot deal with it. As a matter of fact, men were found in the enemy's lines fatally gassed with their respirators properly adjusted. On the other hand, no British soldier was ever gassed through his respirator if it was in good order.

The Special Brigade, R.E., is now all but non-existent. So far as the writer could gather from documents issued before he was demobilised, it was the intention of the 'powers that be' to retain only a small research and experimental staff, who will, no doubt (if gas is ever used again in war), have some rare concoctions to serve up to any nation that is foolhardy enough to test its strength with that of the British Empire.

ROCKS IN MID-OCEAN.

ALL the events chronicled in ships' logs or journals are not to be relied upon as strictly true, although recorded in perfectly good faith; mistakes can easily be made. Thus, in former days sea-charts were dotted over with innumerable little crosses designating places in mid-ocean where from different vessels rocks had been seen rising above the surface of the water. Now, as the result of persistent investigation, practically all these crosses have been removed from the charts, and ships sail freely over the spots where danger was believed to lurk.

When some previously unknown rock was first reported—on apparently good authority—to have been sighted on the ocean highway, it was, of course, necessary to issue a warning as to its

existence; but that in many cases the observers made great errors of judgment appears from the following.

Some years ago Captain Lloyd, of the sailing-ship *Crampton*, reported on his arrival in harbour that he had passed a rock which lay in 47° north latitude and 37° 3' west longitude, in the direct route of the transatlantic steamers. He described it as being about seventy feet long and ten broad, with only the central portion actually rising above the water; and it was completely covered with algæ. From a number of the large steamers a special look-out was accordingly kept when passing the spot, but no suspicious object was seen. Communications on the subject reached the United States Hydrographic Department;

and three vessels passed over or close by the place where the rock was reported as having been seen, but not a trace of it was found. In clear and fine weather the steamer *Ulstermore*, Captain Moore, reached the exact spot. Two men were placed at heights of about sixty and one hundred feet respectively above the water; the officer of the watch was on the bridge; and the captain was in the charthouse somewhat higher up. All kept a sharp look-out. Two days afterwards the *Aurania* steamed over the place, as did the *Lucerna* somewhat later on, and although the weather was still favourable, no sign of the supposed rock was seen from either of the vessels. It would seem as if Captain Lloyd had been deceived by some piece of wreckage. In the neighbourhood, indeed—in 46° north latitude and 40° west longitude—such an object was observed some time afterwards from the steamer *Ingram*. There was only one mast standing, painted dark yellow, and the wreck had evidently been drifting about a long time.

That reports of the finding of previously unknown rocks should not be treated with disbelief, however, appears from the case of the *Avocet*. Some years ago information reached England that the steamer *Avocet* had struck a rock in the Red Sea; but inasmuch as the spot where this was described as having happened was in a part which had for long been constantly traversed by ships, it was thought that some mistake must have been made by the captain as to its locality. Soon afterwards, however, the *Teddington* was wrecked on this rock, and it became necessary to ascertain its exact position. The warship *Flying Fox* spent several days in the search, but found only deep water everywhere; and the *Griffin* met with no better success, although she remained for more than a week at the place, took many soundings, and dragged the bottom with cables. The *Sylvia* stayed six weeks in the neighbourhood without any satisfactory result; but at last it fell to the lot of the *Stork* to discover the rock—not more than six hundred yards from the *Sylvia's* anchorage. At low-water there was not more than sixteen feet between it and the surface.

The steamer *Quetto* sank in Australian waters in 1890, from no apparent cause, when following a route which was traversed by many vessels annually. For a long time the coral reef which was suspected of being the cause of the accident could not be found; and when it was at length discovered by the gunboat *Paluma* there was barely ten feet of water between it and the surface.

In 1876 Captain Pearn was sailing in a small schooner inside the Great Barrier Reef, about fifty sea-miles to the south of Cape York on the Australian coast. When looking over the side of the vessel, his wife drew attention to the fact that the bottom was plainly visible. The captain was aware of the existence of this shallow, which had been sought for in vain on various occasions

by surveying ships, and was accordingly marked on the chart with the word 'doubtful' added. Nineteen years afterwards the steamer *Duke of Buckingham*, when passing over the spot during the night, struck something that was 'harder than water,' but suffered no material damage. Not until 1899 did the surveying ship *Dart* find a very small rock, with some ten feet of water over it, only one sea-mile from the spot described by Captain Pearn, and in the middle of the usual course of steamers. In the interval the little builders had reared their edifice of coral, and in view of the areas where their work is constantly in progress, it seems remarkable that such cases are not of more frequent occurrence.

Even the experienced eye of the seaman is sometimes mistaken as to the nature of objects appearing on the surface of the water.

When Admiral Beaufort was entering the river Plate in 1807 under a press of canvas, what was believed to be a rock appeared right ahead; the sea was breaking against it, and it seemed to be covered with algae and barnacles. Suddenly it disappeared. It turned out to be a whale.

In 1847, from the frigate *Owen Glendower*, a small algae-covered rock was seen about a mile away, with surf beating upon it. A boat was sent out, and not until it had approached quite near was the supposed rock discovered to be a large collection of mahogany wood.

In the China seas, from one of the tops of the warship *Dove*, what was thought by all on board to be breaking surf was observed in 1866. On closer investigation it turned out to be a fight between a whale and a shark.

In 1890, in the Pacific Ocean, breaking surf was seen from the warship *Alert*, and when approached it proved to be thousands of fish playing on the surface.

In 74° north latitude and 16° west longitude, in 1866, a large dead whale was seen floating in the Atlantic, and was taken for a rock, which is hardly to be wondered at, as it showed six feet above the surface of the water and was black on the top.

SONNET.

I WRITE my tropic thoughts beneath the sky,
Full-open to the air; and, meshed by fields
Of apple-green and purple, Nature yields
Me changing scenes of colour; and thoughts fly
Like wanton birds, who know that Home is nigh,
Yet love to haunt the azure-tinted shields
Of cloudland. . . . Thus my craftsmanship ne'er
wields

Its powers of weaving, as the hours flit by.

With light and hope my happy days are lit—
I watch the amorous insects, mating herds;
And I am all alone! But there are words
Full-ready to my pen; for, as I sit
Before my desk, I see the glow and wit
In your dear pictured face—my thoughts are birds!

J. M. STUART-YOUNG.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

IT is at all times a matter of importance to the people of Britain who becomes President of the French Republic, and at no time could the election of the Chief Magistrate of France have been of greater consequence than recently when M. Paul Deschanel was raised to the highest dignity his countrymen may award a man whom they respect, and in whom they have confidence as conductor of their destinies. The British people, then, have reason to be pleased and satisfied that the choice of France has fallen on this careful, experienced, cultured, and dignified statesman, who from the early years of his life has steadily aimed at the achievement of the highest offices in the Republic, even of the Presidency. It has not been recorded of him, as of so many who win the fame of high position, that at his birth such towering success was prophesied for him; nobody is known to have murmured when young Paul first displayed signs of an acute intelligence that he would one day become President of the French Republic. But it was soon apparent to all about him that he was making it his business to hitch his wagon to a star. And now for seven years he will be at the Elysée, the first Frenchman, chief of a brilliant race that has sacrificed much for its safety, honour, and ideals, and is now set the difficult task of restoration and advancement. It has always been a thing of much moment to us who might be chosen President, Britain and France being such near neighbours, with so many strong joint interests, and others which, with the best will of all parties, must inevitably conflict. Let the memory pass back to twenty, thirty, forty years ago, and we recall that Britain and France were not like good friends, trusting and assisting each other. For the improvement, with all its mighty consequences in the most recent times, King Edward, as we know, was the man most to be thanked. During the war Britain and France were drawn more closely together than ever before; the sentiment was everywhere expressed that a brotherhood cemented in such tremendous circumstances, amid such overwhelming common sacrifice, must needs endure and glow in pride and love while humanity held on its track of progress. The thought, the feeling, was sincere enough at that

time, in the heat and passion of war, but we know now, as not then, that in the most absolute sense no men are sane in war; their judgment is disturbed; they see things as they are not; they kindle fancies in their minds which may never be akin to plain reality. With peace, with the return to work, to the normal life of man struggling on to his unfathomable destiny, come calmness of mind and clarity of judgment. So in the case of ourselves and France, we appreciate and respect each other deeply and sincerely as before—but it is remembered in peace that, after all, we are of different races, and that it is easier for oil to mingle with other fluids than for a Latin people to extend to the full intimacy of brotherhood with those of another race, one of vastly different temperament. It has been realised that the relationship must halt at simple friendship and respect, with no tight-drawn bond, and with full liberty to criticise. France, indeed, exercised the right of criticism very early after the Armistice; her remarks upon our policy in Syria were such as in days before the German aggression might have created difficulties. She lectured us; she passed uncomplimentary opinions upon us through her Press. One looking for difficulties might have sworn that underneath carefully chosen words he saw a mild threat lurking. Since then France may have become a little suspicious in other ways. She thinks there were too many intrigues at the Peace Conference, and that we did too well out of that affair, at her expense. M. Deschanel speaks the voice of France—as by a splendid instinct he has always done—when he says that the hopes of 1918 have not been realised for his country. Such feelings are but natural; they arise from the Gallic temperament in strong reaction, and we on our part are perhaps not uncritical either. If we, and what we call civilisation, are to be saved we must be friends with France, and both parties know it. And, knowing it, they have made a bond—to fight again side by side if necessity should arise. There need, then, be no fears upon this point; but for the best results of the peace—such as it is—it is essential that the good relations between the countries should be assisted in every way possible, and that is why it is an excellent thing for Britain that Paul Deschanel is now President

of the French Republic, for he is a lover of our land and people, one who has always contended for policies that would bring the two in harmony.

* * *

Apart from ourselves, the problems of foreign policy are extremely difficult at the present time; never were they more so. Wise heads are needed for their solution. And France at home, with many of her industries so sadly injured, and such vast expanses of her territory laid waste by a mad enemy, has gigantic difficulties to overcome. As she is France she will overcome them, and the belief of the good French that their glorious nation will rise from the fires of war greater than ever before will be justified. With that coming success Britain also, spiritually and materially, will be in many ways associated. For all such reasons, and for many more, it is, as we say, a matter of importance to us that a man like M. Paul Deschanel should become President. It is a sign also of the change of mind of our neighbours from a war to a peace condition. The services that M. Georges Clemenceau has given to France and the world in the hour of great crisis are too vast and too solid to be estimated, much less criticised. He was the man that France found in her hour of agony, and more than any other statesman did he contribute to saving her. He did so by the exercise of good sense, the pressure of a tremendous personality, and a peculiar bulldog, stubborn refusal to admit the possibility of defeat in any circumstances. Called to the Premiership when his people were in peril, he braced them to their ordeal, infused some of his own strength of will into them, and led them to victory as no other could. During this period M. Deschanel was President of the Chamber of Deputies, and it was his business—as it was his patriotic delight—to make orations suggestive of the glory of France and her unconquerable spirit, at the time of the opening of Parliament and on other occasions. His speeches glowed with love of country and pride in it; they were rich in hope; above all, they were finely composed and phrased, the deliverances of a cultured man of high thinking with a keen sense of the dignities. When M. Clemenceau became Premier, and made his first speech as such, the burden of it was, repeated many times, 'I make war! I make war!' He, so closely pressed by a relentless enemy flushed with success, would be aggressive against that enemy. This great patriot let loose the flood of his emotions, and, with his back to the wall, told Germany and the world that France would perish ere she would give way, and, meaning it, he made France mean it. That was the spirit that was needed. M. Deschanel, so different in mind as in appearance—a small, slender man, with fine sharp features—could not speak like that, though he is not less patriotic than M. Clemenceau. Reason, philosophy, thought, care of expression, a peculiar

sense of dignity, lead him always to a more restrained, a higher, method of speech. So, while M. Clemenceau was the best possible Premier for war, M. Deschanel is doubtless the best President for peace, and the choice of the one over the other (for M. Clemenceau, who was not unwilling to become President, but yet not ambitious for the honour, withdrew when a preliminary vote had shown him that at least M. Deschanel would hotly contest the election, and might quite likely defeat him) represents in some measure the change from the war to the peace feeling in France. There are some, especially in this country, who seem not to understand how it came about that the great Clemenceau, the idol of his people, he whose war services were so supreme, was not the unquestioned, unopposed successor of M. Poincaré, as indeed, until within a few days of the election at Versailles, it appeared he might be. But that may be because of an insufficient understanding of the French spirit, the deep convictions and the essential desires of this exclusive and brilliant people. Among those who understood there was no such confidence that M. Clemenceau would find himself at the Elysée, nor is it considered that France will lose by the selection she has made. M. Deschanel, elected by the greatest majority ever given to a President—734 votes out of 888—is a fine man for the leadership of France in her most difficult years. He will exemplify the French spirit in peace as M. Clemenceau exemplified it during war.

* * *

Here, as it may seem, one may be making to some extent an inaccurate comparison by associating a Premier with a President, but it is not so. The President chooses the Premier, and the latter in constructive work is the man who counts for most in France. M. Deschanel, careful, methodical, cold, of perfect equilibrium, actuated always by reason and hard judgment, as unprejudiced as man may be, has as his first Premier M. Millerand, who voted against him at the Presidential election at Versailles; and we shall hear much of Millerand in the future. This new Premier (presumably M. Deschanel's nominee, though actually appointed by the outgoing President) is sixty-one years of age. Beginning life as a barrister, he crept into journalism, in which occupation so many of the best and most flaming minds in France have found their satisfaction, and was associated with M. Clemenceau in the production of *La Justice*. In the Chamber he became an ardent reformer, and one of the best speakers on the Extreme Left. For a long period he edited the organ of the Socialist Union, called *La Petite République*, defended many trade societies in the law-courts, and, with Briand and Viviani, he assumed the control of *La Lanterne*. Becoming a Cabinet Minister for the first time in 1898, when Waldeck Rousseau was Premier, he passed successively from Com-

merce to Public Works and then to War—in 1912 under Poincaré. After a year of this office, he took to championing the cause of national defence, for he had come by a keen appreciation of the forthcoming German aggression. Under Viviani also he was Minister of War; latterly, until called to the Premiership, he was Commissioner-General at Strasbourg. Such is the Premier; he is a man of much power in France, and vast responsibility. M. Millerand has a ponderous and most serious task in front of him, not only in the matters of foreign policy and constructive work for overcoming war effects at home, but in manipulating the politics of his people to the best advantage; for, though it is easy to say that Socialism was routed at the last election in France, all know how it was done, and that Socialism there is not less strong than formerly, a serious factor among the political forces of the State.

* * *

But, having seen what M. Clemenceau was as Premier, and how much greater he bulked in wartime than M. Poincaré as President, enormously valuable as was the effort always of the latter, the islander who may hitherto have concerned himself little with French affairs and methods (feeling now, as do all, that, what with war and aeroplanes and so many other things both good and bad, we are hardly islanders more, and it behoves us to get to study upon all Continental men and things) may be disposed to inquire as to where the President enters into the general scheme of France, and how it comes about that M. Deschanel is now of more importance than when President of the Chamber of Deputies, an office in many respects comparable to that of Speaker of the House of Commons. The idea of those who are not French, and are not of the understanding that comes by positive knowledge, often goes astray in comparison between the President of the Republic of the United States and the President of the French Republic. They see Mr Wilson acting vigorously, definitely, and with high responsibility for the United States, and being no mere figurehead, but a worker who all the time is in the maelstrom of politics; and they have seen M. Poincaré, and now M. Deschanel, enthroned almost, as one would say if not dealing with republics, on high at the Elysée, there, in great republican state, receiving kings and princes from foreign lands, and exercising a wise discretion in impartial advice to the troubled leaders of the people and others of high importance who seek assistance and consolation from the Chief Magistrate. But there is a wide difference between the powers and privileges of the Presidents of the two republics; their offices are not planned alike. The American President is Chief of the State and Chief of the Government at the same time; the French President is Chief of the State alone. He is surrounded by all the appearances of power, but all know

that in many respects his chief business is to fulfil the appearances of authority, and that it is the Premier who possesses most of the reality. Yet the President has great powers also, and one of the mysteries of the parliamentary régime in France is the part in effective direction that the Chief of the State possesses. The list of the President's attributions is wonderful and long. He can prevent the Chamber of Deputies and the Senate from assembling for more than five months in the year, and even within this time he may in special cases suspend the sitting for a month or two. He promulgates the laws that have been passed by both Houses, but may refuse to promulgate any law that he considers bad, instead calling the attention of the country to it, and demanding a fresh consideration of the Bill in question. In agreement with the Senate he may dissolve the Chamber, this right of dissolution not being given to the President in any other republic. To foreign countries he stands as the sole representative of France; his signature is that of France. He concludes treaties with foreign states, and may even make secret treaties. Any such treaties, however, that affect the area of France or her colonies must be approved by Parliament. He may make and unmake Ministries; he awards appointments to all civil and military offices, has the right of individual pardon, and can be called to account only if charged with high treason. Such are the regulations and the privileges, but the personal coefficient has counted for much since the establishment of the Republic. The men who have held the office have one by one established traditions in connection with it which have had a collective effect, and that inevitably in the way of restriction. This is held to be a chief reason why M. Poincaré, a man of rare qualities, found himself to some extent crippled during his term of office when France was passing through the most terrible crisis of her history. The Presidency of the Republic has been reproached with being a 'parliamentary monarchy,' but this is an exaggerated idea, since in countries where the monarch is in some measure autocratic he superimposes himself upon the democracy, and the Premier is his instrument. Such a monarch is tolerated, but the President is elected. It is said that this election is to him an invitation to persevere in the exercise of his temperament, and even to exaggerate it, and thus the decision of Versailles must have great repercussions upon the destinies of France.

* * *

It is worth while, then, to glance at the record and the personality of the new President of the French Republic, friend of Britain as he is, known everywhere for his thoroughness, his tact, and his impartiality, and calm, calculating judiciousness, the latter qualities strikingly exemplified during the years that he occupied

the difficult office of President of the Chamber of Deputies, a circumstance, among others, which has tended to keep him out of mere party politics. It is remarked that during the long exercise of this office he never made an enemy; that all parties, violent in their opposition as they have been, had equal confidence in him; and that his honesty and impartiality were never challenged. When the times for his election to this office came he was given it by a unanimous vote. So he has studied politics of France from a neutral base in a way that no other President of this, or perhaps any other, republic has ever done, for it is an interesting fact that he has never held any Cabinet appointment. Sixty-three years of age, he was born in exile at Schaerbeek, a suburb of Brussels, his father, a professor of literature and a considerable intellectual force in the Paris of his time, having been banished from France by the Second Empire for his Republican opinions. Deschanel *père* attached himself to the same cause as Victor Hugo, and the poet dedicated a poem to him. And here in passing is the opportunity to mention that, despite the fact that M. Deschanel is a lover of literature, a very considerable writer (having published sixteen books), and a member of that exclusive body the Académie Française, he has himself written only one poem, or, anyhow, only one has reached the printers. It concerns his father's exile, and was written in reply to some verses of congratulation that the parent sent to him when he was elected to the Académie. These are the new President's verses:

Dès le berceau j'appris le nom de la patrie
Interdite à nos pas, et d'autant plus chérie !
Ton exil pour le droit m'enseigna le devoir.
J'appris sur tes genoux que 'vouloir c'est pouvoir.'

Et maintenant, assis sur ton épaule, o père,
Je vois loin. . . . C'est le fruit de ta longue misère.
Le sort, qui semblait dur, avec son lourd marteau
Forgeait sur ton exil notre avenir plus beau.

The Belgians in these days feel they may congratulate themselves on the peculiarly interesting and agreeable fact, in view of the alliance during the war, that their land gave birth to the new President. It was at 176 Rue de Brabant, which is now a draper's shop bearing the sign of the Boule d'Or, that he first saw the light, and not long since a tablet was attached to the building bearing the inscription: 'Ici est né Paul Deschanel, Président de la Chambre des Députés du beau pays de France.' He has, moreover, Belgian blood in his veins, for his mother was a native of Liège. Educated at the Sainte Barbe College and the Lycée Condorcet, eventually he took degrees in letters and law, and began his political career in 1878. The terrible days of '70 and '71 were slipping away into the history of the past; the Empire had gone; the Third Republic was settling down. He himself in politics is a moderate Republican. Sub-prefect for Dreux in 1878, after occupying various ana-

logous offices, he was elected to the Chamber of Deputies by the constituency of Eure-et-Loir in 1885. During eleven years he steadily gained in parliamentary prestige, so that in 1896 he was elected Vice-President of the Chamber, and two years later became its President for the first time. This onerous post he held till 1902. He was re-elected in 1912, and in 1914 was selected for the office a third time. The chief characteristic of his exercise of it, apart from the impartiality and the tact which have been mentioned, has been his admirable serenity at all times. It is said that he always preserves his equanimity, is always serene, even when the violent emotions of his French heart threaten to disturb the clarity of his judgment, and that he can discern the light when the rest of the Chamber sees only cloud and the deep shadows of doubt.

* * *

As we have said, M. Deschanel has written many books, and has devoted himself to literary and political subjects. It was far away back in 1883 that he first became author by virtue of a work on *The Question of Tonkin*, as to which it is remarked that France even to-day feels the benefit of it in the matter of Eastern policy. Next year there came from his pen *French Policy in Oceania*, and again a year later there appeared *French Interests in the Pacific Ocean*. In these works he developed a line of foreign policy and argument, and made such close studies of a question of the utmost importance to France, that he was chosen to preside over the Commission of Foreign and Colonial Affairs. Some years later, after an experience of parliamentary men and things, there came *Orators and Statesmen*; then in his literary efforts he departed from politics for a while, and produced *Feminine Figures* and *Literary Figures*. To politics he returned, and most of the remaining works have been devoted to the subjects with which he has been chiefly concerned; but his last book of all, published in 1913, was a brilliant study of Lamartine. This is to show that France has for her President now no mere politician, but a man of the highest culture and refinement, who has a soul above mere political things, as the good President should always have, even though in his impartiality he is conjoined to politics all the time.

* * *

The personality of the man is interesting. He is in all respects precise. His neatness, always so dapper and nice, is an outstanding characteristic, and from his youth onwards he has always been an extremely well-dressed man. In passing, mention has been made of the strong French emotions that he controls so well that nothing of them is ever seen—at least when it is desirable that they should be hidden. But it was not always so. M. Deschanel has fought a duel, and whom was it fought against but

M. Clemenceau himself! It was in July 1894 that these two personages, since risen to the highest places, quarrelled about a debate in the French Chamber on the anti-anarchist laws. M. Deschanel had severely attacked M. Brisson, and in *La Justice* M. Clemenceau retaliated, and said strong things of M. Deschanel, which resulted in the latter challenging the 'Tiger' to a duel, which was duly fought with swords at Boulogne. M. Deschanel was slightly wounded on the forehead, honour was satisfied, and now on his election as President he took the initiative in preparing an address to M. Clemenceau, who had in a certain measure been his rival for the Presidency, expressing France's acknowledgment of the 'unforgettable services' the retiring Premier had rendered to his country. M. Deschanel is a happy family man, with a charming wife, a daughter of seventeen, and two younger boys. Never hitherto has there been a President of the Third Republic who has had children with him at the Elysée. Mme.

Deschanel will impart distinction to the social side of things. A brilliant woman, while her husband was President of the Chamber she ruled a *salon* which was a notable centre of parliamentary personages and cultured Paris. During the war she exerted herself with energy and enthusiasm on behalf of the Red Cross. Some people will say that M. Deschanel is fortunate thus to become President in such circumstances. In some ways it may be so; but he has earned the honour, is worthy of it. And think of that tremendous vote at Versailles! In that there is no mere fortune. However, here, in ending, it may be added that the first test of his candidature was made on what he regards his best day of the month, and that is the thirteenth! 'My life is very simple,' says he. 'I was born on the thirteenth day of the month, I was married on the thirteenth day, and on the thirteenth day they designated me in the Chamber as candidate for the Elysée.' And so, *Vive la France!*

FIFINE'S PROBATIONER.

PART II.

I.

AT this juncture there were three possibilities which might have helped the situation. The first was, had Jerwood been less hopelessly in love, and better able to look after his own interests; the second was, could Miss Martindale have been induced to withdraw; and the third was that Fifine should wake up from her present absorption in everyday amusements and take her fate in her own hand. Not one of these possibilities, however, appeared in the least degree likely. And in this way four months elapsed.

For Jerwood it had been a time of much-varying experience. Of course, there was the almost daily rapture of meeting Fifine; but, on the other hand, there was the drawback of hardly ever having her to himself. Aunt Bobo took too warm an interest in the young people to leave them to themselves. Then, as we have seen, there were constant little mortifications being devised by the said aunt for his benefit. For, however delicate and uncertain might be his position in relation to her niece, there was nothing either delicate or uncertain in the use made by Miss Martindale of her assumed right to snub him or to administer unpalatable advice. Under this trying regimen, enforced in these peculiar circumstances, a lad of less fine nature than Monty's might easily have been betrayed into committing himself. He might either have been cowed into a dull and spiritless demeanour, or provoked to angry retaliation. Neither of these things happened to Jerwood,

who contrived to retain, amid repeated provocations and brow-beatings, not merely his good temper and his cheerfulness, but his dignity as well. In a young man of character as yet imperfectly developed, his forbearance was distinctly creditable. And to what do you suppose he owed it? To that 'possible strength in actual weakness,' which is love. The thought of Fifine carried him through. And though 'twas, after all, but a mean and petty persecution, the man who can bear himself well under petty persecution is seldom the worst man in a tighter place. And I believe that this was true of Jerwood.

'Now that you know him better, dear Martindale,' said Lucy Laurillard to her sister-in-law one day when they sat alone, 'I hope you like him better? Oh, I do so hope it!' She spoke with fluttering amiability, awaiting an answer.

'Well, really, I hardly know what to say,' replied the she-dragon at length. (It was seldom indeed that *she* would go half-way to meet any one.) 'I've no particular fault to find with the young fellow! It is simply that he wants *that*, as Sir Joshua Reynolds once said of some painter or other who had all sorts of qualities and yet failed to please.' And Miss Martindale snapped her fingers contemptuously. 'I'm afraid, Lucy, that to want *that* is a serious failing, and the worst is, there's no getting over it.'

For a time she had been wont to sneer at the young solicitor as one who couldn't say *Bo* to a goose. But his cool and skilled management of a boat in difficulties on Filey Brig some weeks

before had deprived that criticism of its effectiveness.

Poor Lucy sighed a sigh of disappointment. It was so seldom that things in this world went altogether happily.

'Perhaps it is more to the point to know what Fifine thinks of him,' resumed Martindale sententiously. 'Apropos, I asked her yesterday, and she said he was the "right sort." Strange girl!'

'She is a strange girl, sister. There's more in her than one suspects. Do you know, I asked her the same question this morning.' . . .

'Well?'

'And she said he was "one of the best."'

'H'm! Of course, neither of these two slang phrases means much—probably not much more than that it's convenient to have the use of a car. For a child of her years and temperament, Lucy, your daughter is uncommonly reserved. Still, she's not altogether a fool, and I shall be much surprised if she fails to resist the blandishments of Mr Monty Jerwood! A few weeks will show.' And Fifine's aunt laughed an acid laugh.

II.

Things were in this position—a position by no means altogether satisfactory to any one of the parties concerned—when something happened to the Laurillards—something which, in its own way, deserves to be described as one of the most unexpected things that have ever happened to so quiet and unpretending a family. In order to understand what it was, it is necessary to premise that the Laurillard estate was at this time owned by the erudite and eccentric Simon Square, the family historian; that his years already exceeded the allotted span; and that he was without direct heirs. Well, one morning there was delivered at the small house at the base of Oliver's Mount a letter written by this gentleman's solicitors, and addressed to Mrs Laurillard, which contained an astonishing announcement. This was, in effect, that, having devoted the best years of his life to investigating family records, and having in the process developed a great reverence for old families and an equal unwillingness to see their possessions alienated, Mr Square had decided to hand back the Laurillard estate to the present head of the Laurillards; and, furthermore, that, with the object of evading the succession-duty, to which he was in principle opposed, he wished the change of ownership to take place at once, rather than at his demise. . . .

Having read thus far, though but vaguely grasping the import of what she read, Mrs Laurillard began to shed silent tears, and handed the letter to her sister-in-law. Miss Martindale read it with raised eyebrows.

'Can it be genuine, sister?' questioned poor Lucy, dimly suspecting a hoax.

For some moments Martindale held her opinion in reserve, unwilling either to betray emotion or to deliver herself at random. 'I see no reason to think otherwise,' said she at length. 'The notepaper and the signature are those of a well-known Lincoln's Inn firm, and, now I think of it, I have often heard old Mr Square described as a man much swayed by antiquarian sentiment, and quite capable of acting fantastically, as I suppose the world would call it. I had scarcely conceived, however, that it might enter his head to make Fifine an heiress.'

'My Fifi?' softly screamed poor emotional Mrs Laurillard.

Her sister-in-law regarded her severely. 'Really, my dear Lucy,' protested she, 'I do most heartily wish that you would be more sparing of your Fifis and your Fifinettes! Does it not occur to you that at your time of life they are just a little ridiculous and get upon folks' nerves? And surely, with all the childish fuss you make, you haven't waited till now to realise that, since the death of Cousin Carileph without issue, Josephine is head of the Laurillards!'

Lucy Laurillard drew a deep breath. 'Then Josephine is heiress of Laurillard?'

'Heiress; or, perhaps, more strictly, owner,' returned Martindale with imperturbable calm, 'for old Simon doesn't seem to have thought it necessary to consult us before giving effect to his whim. But, I presume, we shall not boggle over that.'

By this time Lucy's tears were flowing freely—those tears which were her refuge alike in joyful and sorrowful moments, perhaps especially in the former.

'Let me call Fifi and Monty, Martindale,' she exclaimed, rising impulsively from her chair.

But Martindale laid a restraining hand upon her. 'A single moment, Lucy!'

So Lucy unwillingly sat down again, whilst Martindale resumed: 'I believe that even you, my dear, must recognise that this crisis calls for very careful handling.'

She spoke so very gravely that the younger lady grew alarmed. 'How so?' she asked with bated breath.

Then Martindale played her ace of trumps. 'Why, does it not occur to you that this is an opportunity vouchsafed by Providence for getting rid of that troublesome entanglement?'

'You don't mean the engagement with poor Monty?'

'The entanglement with poor Monty, if you please! Not the engagement; for engagement there is none, nor ever has been—he himself must acknowledge that. . . . Yes, surely you comprehend, Lucy, that if Miss Laurillard of Laurillard was too good for young Jerwood when "of Laurillard" meant no more than an inscription on a visiting-card, then ten thousand times

too good for him must she be when "of Laurillard" means a landed estate?'

Lucy raised her hands and dropped them despondingly. 'What on earth are we to do?'

It seemed that the moment for which the aunt had been striving had at last arrived. She answered firmly, 'Leave things to me.'

And Lucy seemed about vanquished; she answered nothing. But at that instant a third voice spoke: 'Rather leave them to me!'

III.

The speaker was Fifine, who had slipped unnoticed into the room, and, hearing her own affairs being discussed, had allowed the discussion to proceed uninterrupted—which was possibly not quite sporting of her. Both the elder ladies were taken by surprise. But, recovering her composure with an effort, Miss Martindale inquired, 'And pray, niece, what would you propose?'

There was offensive patronage, covert aggression, in her tone; but Fifine kept her coolness. 'I'll tell you in a moment, auntie; first I want to call Monty. It's only right that he should know of this letter mummy has received; and as he knows all about the law, he will be able to tell us what to think of it.' And before her aunt could stop her, Fifine was out of the room and was heard calling Monty.

He came at once, and when the children (in some respects they were scarcely more) entered the room Lucy noticed that they were hand-in-hand, and thought they made a pretty picture.

Without demur on the part of the aunt, who perhaps realised that it would be useless, the lawyers' letter was handed to Jerwood, who carried it to the window for quiet study, and reported that it was in proper form.

Here Lucy felt emboldened to assert herself. 'Let me understand,' she said, raising one hand to her brow; 'is dear Fifine, then, really Miss Laurillard of Laurillard in the very fullest sense?' And she glanced appealingly at Jerwood.

But no lawyer, be he ne'er so immature, ever answers simply 'yes' or 'no.' So young Jerwood now replied that if things were truly as they appeared to be, and if nothing unforeseen supervened, then Fifine might really regard herself as having the fee-simple of Laurillard vested in her. (To have put the matter plainer than this would have been to fail in what was due to himself.) And, more by the expression with which he said it than by what he said, the ladies gathered that this rigmarole meant yes.

'How delightful! Kiss me, Fifi.'

The speaker was Mrs Laurillard. But once more Fifine surprised them. 'In a moment, mummy,' she replied. (On Jerwood's return from the window, she had placed herself beside him and

again taken his hand.) 'In a moment; but I must kiss Monty first. And I may as well tell you and aunt that we've decided to put an end to that stupid probation, and be engaged like other people.' Then, as an afterthought, she added, 'That was before this news about the estate reached us. But, of course, that makes no difference, does it, dear?'

So Fifine, the sleeping beauty, was awake at last! That is, supposing she had really been asleep, and not merely pretending, or allowing people to think her so. In any case, however, my analogy now breaks down, for it was she who kissed the prince—or, at least, she kissed first.

Meantime, if angry feelings were always expressed in terms of sound, there would have been a thunderstorm going on in the room, for Aunt Martindale was raging inwardly. 'We have decided'—these words of Fifine's kept resounding in her ears; 'decided,' if you please, without reference to herself, the aunt who had been such a good friend to the family! Truly Fifine had not been long in presuming upon the change in her position! The little minx, indeed! And as she sat fuming thus, Miss Martindale was again and again within an ace of springing to her feet and proclaiming her intention to leave the house. But, with all her infatuated desire of domination, she was not wanting in masculine sense, which, in the nick of time, suggested that her dread announcement might fall flat. To the good, affectionate Lucy it would, of course, be terrible; but even she would soon get over it. And as for those bad young people (so different from the young people of her own day!), so entirely absorbed were they in one another that they might even take it without turning a hair! Besides, how would it suit her own book not to be on friendly terms with the family, now that they really were once more Laurillards of Laurillard? On the whole, then, she decided to think better of first impulses, and, whilst the youngsters rushed off to tell the elder Jerwoods, she devoted herself to convincing tearful Lucy that the happy turn things had taken was very largely due to herself. And in one sense this may have been true. For I shouldn't be surprised if Monty's conduct under difficulties had done much to awaken the observant Fifine to a true sense of his merits. At any rate, as they hastened towards the Crescent, Fifi observed, 'You dear old boy, how well you stood her tantrums! I tell you, I couldn't have done it! I was often sorry for you.'

To which Monty made lordly reply, 'Pin-pricks, my dear! . . . No, to tell you the truth, it was just a bit galling at times. But it was for you.' . . .

And if it hadn't been a public place . . .

THE END.

THE MONTH: SCIENCE AND ARTS.

WASHING UP MADE EASY.

FEW domestic duties are more irksome than the constantly recurring washing up of crockery after each meal; hence it is only natural that inventors should have directed their efforts towards minimising the work involved in this operation. In the 'Premier Washerup' dirty crockery is cleansed and dried without any hand-work at all other than that of placing the pieces in racks. The apparatus consists of a galvanised steel cupboard with folding-doors, fitted with a wire shelf at the top for cups, and graded racks below for saucers, plates, and dishes. The cups are inverted, and water is squirted into and round them through a series of jets. After cleansing the cups the water drops on to the crockery in the racks below and removes all grease and dirt. The 'washerup' is mounted next to the sink, and a short length of rubber tube with a Royle's hose fitting is connected to the hot-water tap for a few minutes, when, hey presto! the work is done! The actual washing up being completed, the apparatus next serves as a plate-rack, in which the pieces gradually dry, so that no wiping is necessary. In small households the crockery can be put to soak in cold water in the tank at the bottom of the 'washerup' after each meal, the lot being cleansed at the end of the day.

EMERGENCY FLOATS FOR 'LAND' AEROPLANES.

Aeroplanes are divided into two classes—(1) those fitted with wheels for 'taking off' from, and alighting upon, the ground; and (2) flying boats or seaplanes, which float on the water. During the war some 'land' aeroplanes were provided with detachable floats that could be cast off or retained according as to whether a 'landing' was to be made upon the ground or on the sea. In the battleships and large cruisers, small machines were flown from runways on the big gun shields. Such machines were necessarily of the land type, with wheels for alighting, and if they came down on the sea would sink. To enable these and other aeroplanes to alight upon water with safety Squadron-Commander Busteed devised bags made of balloon fabric. The bags were fixed under the lower wings between the leading edge and the front spar, and when folded flat produced no appreciable effect upon the machine's powers of flight. When it was proposed to come down on the sea the flaps holding the bags flat against the wings were released by pulling a cord, and the bags were blown up by air from a compressed-air starting-bottle. These bag-floats, in conjunction with a permanently inflated bag in the fuselage, were capable of keeping a machine afloat. An improved edition of this apparatus is now available for all machines which

have to cross the sea, although primarily designed for rising from and landing upon the ground.

THE 'TELEDICTAPHONE.'

A familiar object in many business and editorial offices is the dictaphone, an instrument which records on wax cylinders letters or articles spoken into it, with a view to their being reproduced at will and transcribed by a typist. The principle underlying its construction has been extended recently to telephone messages by the addition of what is known as a 'vibration motor,' which so amplifies the vibrations of the human voice as transmitted through the telephone that they are capable of cutting a record on wax. Major the Hon. Lionel Guest (brother of the Coalition Whip) and Captain H. O. Merriman, a Canadian electrical engineer, are responsible for this development. Referring to the possibilities opened up by the invention, Major Guest made the following statement: 'I think in the near future it will be possible for a receiver to be placed in a part of a hall, say in Manchester, where the speaker's voice is hardly audible, and at the other end of the wire in London the message will be recorded verbatim by the "telephone recorder" for instant reproduction through ear-pieces to the newspaper-offices. If the receiving operator misses a word he presses a button, and the line, or any number of lines, is repeated as often as he likes.'

A SITTING-ROOM RANGE FOR THE KITCHEN.

Now that so many households are reduced to one fire, a sitting-room stove of ordinary appearance that is capable of performing all the functions of a kitchen-range should prove invaluable in the small house or flat. This feature is to be found in the 'Interoven' cooking and sitting-room stove, which contains an oven, a hot plate, a boiler, and a hot chamber or under-oven, while presenting the appearance of a handsome sitting-room fireplace with a suitable mantelpiece. When they are closed one would never suspect the ornamental panels below the mantelpiece of forming an oven door. The door is hinged at the bottom, and can be lowered to a horizontal position, in which it may be used as a temporary support for the viands on their way to or from the oven. Bread, pastry, or cakes can be baked in the oven, which is large enough to take a 12-lb. bird or an 8-lb. leg of mutton. Equally deceptive is the back of the fireplace, which pulls down and forms a hot plate. The boiler occupies the usual position at the back of the fire, but, unlike the boiler in the ordinary kitchen, it is not bricked in, and can be taken out after disconnecting the flow and return pipes from the hot-water cistern. An ash-drawer is arranged under the grate with

the hot chamber below it, this chamber becoming hot enough to bake milk-puddings, pies, &c. A swing-trivet is arranged at each side of the stove, and these can be used over the open fire or with the hot plate down. Dampers are provided for controlling the draught. All the flues are self-contained, and are easily cleaned; in fact, every part of the stove is readily accessible. Compared with that of the ordinary kitchener, the consumption of coal in these stoves is very small, while the advantages are obvious of cooking in a sitting-room and keeping up a supply of hot water without any sacrifice of æsthetic appearance.

THE HELICOPTER.

The idea of a flying-machine which should draw itself vertically up into the air by means of horizontal propellers mounted on vertical spindles has always attracted the attention of inventors. Two propellers rotating in opposite directions are obviously necessary, as if only one were used the fuselage or body of the machine would turn backwards as fast as, or faster than, the propeller turned forwards. Some interesting experiments were carried out during the war with a view to developing this type of flying-machine, which is known as the helicopter. The idea of the experimenters—Dr Peter Cooper Hewitt and Professor Francis Bacon Crocker—was to reproduce the lifting action of an aeroplane's wings in a circular direction, so that a straight lift upwards would be produced without horizontal motion. Instead of the ordinary design of air propeller, therefore, a type consisting of aeroplane-wings mounted upon a cross-bar was developed. Each propeller has two blades or wings 15 feet long and 30 inches broad, which are fixed to a tubular steel cross-bar, the distance from wing-tip to wing-tip being 51 feet. The vertical spindles are, of course, tubular for lightness, and that for the upper propeller revolves inside the one for the lower propeller, and in the opposite direction. Particulars available at the time of writing, which have been taken from *The Rudder*, indicate that a lift of 20 lb. per horse-power has been obtained from these propellers when turned by two electric motors at seventy revolutions per minute, this pull being said to be twice the thrust per horse-power given by the ordinary aeroplane propeller. In an actual helicopter means will be provided for tilting the spindles over at an angle, when the propellers will give a combined lift and forward motion. It is easy to understand that such a machine would have many advantages over the aeroplane, as it would be able to rise straight upwards, to hover over one spot if required, and to come down gently exactly where desired.

A STOVE FOR BURNING SAWDUST OR PEAT-DUST.

In our issue for April 1918 we published a description of 'A Simple Stove which Burns Saw-

dust,' and it is interesting to observe that among the exhibits to be seen at the recent 'Ideal Home Exhibition' was a stove of this kind. It consists of a plain sheet-iron cylinder closed at the bottom, and mounted on four legs. At one side, near the top, is a hole for the flue-pipe, while a smaller hole low down on the other side admits air. The sawdust or the peat-dust is not put directly into the stove, but is packed into a sheet-iron container, and in order to allow a flow of air through the fuel a central wooden pin and a horizontal pin to meet it from the air-hole in the side are fixed in position before the container is packed. These pins are withdrawn when the container is firmly packed, leaving a passage from the air-hole to the central flue. The container exactly fits the stove, and the air-holes in each coincide, while the top of the container comes just below the flue. After the container is in place a lid is put over the top of the stove, and the fuel lit at the air-hole, when it will burn steadily for from five to seven hours without attention. This stove, which is known as the 'Cendra,' measures 2 feet 3 inches in height and 14 inches in diameter, and the container holds 16 lb. of sawdust or 14 lb. of peat-dust. It gives out enough heat to warm a moderate-sized office or conservatory, for which purpose it is very suitable. A kettle can be boiled on the top if desired.

WASHING-MACHINE FOR THE HOME.

Now that laundries are charging such high prices, many housewives prefer to have the washing done at home. Washing, however, is one of the most irksome and laborious of domestic duties, and it is not surprising that numerous machines have been devised with a view to eliminating the more objectionable features. Among the washing-machines to be seen at the 'Ideal Home Exhibition' was one known as the 'Thor,' which appeared to present many claims for favourable consideration. The washing is done in a galvanised iron tank, rectangular at the top, but rounded at the bottom. Inside is a horizontal wooden cylinder, built up of staves with gaps between them and with a line of holes along the middle of each, the aim being to allow the freest possible circulation of the hot soapy water with which the tank is charged up to about the middle of the cylinder. A sector of the cylinder is removable for the insertion of the dirty clothes, and it is fitted with longitudinal ribs which carry the clothes upward a certain distance as the cylinder is slowly revolved (first in one direction and then in the other), until they fall off into the water again. Naturally, if the cylinder were full of clothes this action would not take place, and experience has shown that the best results are obtained when it is rather less than half-full. The inside of the cylinder is carefully smoothed, and all corners are rounded, so that the most

delicate articles can be washed without risk of damage. At one end of the tank is a wringer of the usual design. An electric motor under the tank drives both the washing-cylinder and the wringer, either together or separately, through suitable reduction gears and shafts, which are all completely closed in. The wringer may be run in either direction. It is claimed by the makers that a good-sized washing can be made ready for the line in an hour at a cost of a penny for electricity, while the machine can be connected to any lamp-socket. A special feature of the 'Thor' machine is a device on the motor spindle which protects the motor from damage if the cylinder or the wringer is stopped by some obstruction. Different sizes of the machine are made, adapted for the various needs of large and small households, hotels, clubs, and institutions.

A SILENT WICKLESS OIL COOKER.

In country districts where no gas is available cooking must be done by means either of a coal-range or an oil-stove. Owing to the high price of coal and the difficulty of getting it, the former must be ruled out in many households, leaving the oil-stove as the only source of heat for culinary operations. Two kinds are available, those with wicks, and those in which the paraffin is vaporised and blown through a fine jet under considerable pressure. The former smell and are difficult to keep clean, and the latter make an irritating roaring noise, and are dangerous if left unattended for long periods. A new design of wickless paraffin burner has been brought out recently which is silent in action, gives a flame without any yellow in it, and can be safely left alone for an hour or more. This type of burner is to be found in the 'Supreme' oil cookers and water-heaters. The cookers are furnished with two or more burners, mounted under holes in a hot plate supported on legs. At one end is the oil-reservoir, with a self-contained air-pump and a pressure-gauge. In the largest size the reservoir serves four burners, one being used for a portable oven, the others being available for boiling as required. The oil is also available as an illuminant, giving, with an ordinary mantle, a pure, white light. In the 'Supreme' water-heater the heater is mounted on three legs above the burner and the container; a piece of rubber hose with a tap-fitting connects the apparatus with the bath-tap. Even a copper can be heated by one of these burners, the water being boiled almost in the time it takes to start a coal-fire. All the burners can be turned up or down by small needle valves, independently of the pressure in the reservoir.

MINE EXPLOSIONS CHECKED BY NON-EXPLOSIVE DUST.

One of the many dangers in coal-mines arises from the liability of the coal-dust to explode; moreover, what would otherwise be local explosions are spread along the headings by the

dust they stir up, and become serious conflagrations. Experiments have shown that if the coal-dust is mixed with a proportion of non-combustible matter, such as the dust from slate or stone, it will not burn, and this fact is taken advantage of to localise explosions in some American mines by mixing the first rush of air with stone-dust. This dust is contained in boxes along the roofs of the headings, clear of the traffic, and so suspended that the jar of an explosion causes them to discharge their contents instantaneously, thereby rendering the coal-dust non-combustible.

FLOOR-SCRUBBING MADE EASY.

That women go down on their knees to scrub floors has always been a source of surprise to the sailor, and he frequently wonders why the handiest of all cleaning implements—the mop—finds so little favour with the housewife. In a ship decks are scrubbed with the help of long-handled brushes without stooping, and are afterwards dried with mops. Until recently mops have been rarely used in houses, for the simple reason that there was no convenient method of wringing the water out of them. This difficulty is now overcome by an implement known as the 'Spirette,' which comprises a long-handled scrubbing-brush, a mop, and a wringer, all the metal parts being of aluminium, so that the total weight is only 3½ lb. When the scrubbing-brush is in use the mop is carried in the wringer clear of the floor. By a simple turn the mop is slid down over a spring similar to that in the stick of an umbrella, and put into use, while the scrubbing-brush is held above it. The wringer is of the shape and size of a pudding-basin, but the sides are formed of bars. By giving the mop a few turns in it the water is squeezed out and runs into a pail, to the inner side of which the wringer is attached by metal hooks. With this implement floors are scrubbed and wiped dry, the operator all the time maintaining her upright position. Moreover, boiling water and strong disinfectants may readily be used, as the hands never touch the water or the mop. It is often said that women have not got the inventive faculty, but here is a practical machine devised by a woman for women.

A NEW DEVICE FOR PREVENTING TIRE-PUNCTURES.

It is safe to say that during the last twenty-five years hundreds of patents have been taken out for the prevention of punctures in pneumatic tires. In most of them the central idea was to make the tire impenetrable to nails and other injurious articles. A recent inventor approached the problem from a new angle by studying the process by which the nail gets into the tire. He found that (1) nearly all nails lie *flat* on the road; (2) in motor-cycles and cars 90 per cent. of nail-punctures are in the *rear* tires; (3) punctures occur most readily at *high speeds* and

on *dry* roads; (4) the front tires are pierced by *short* nails, the rear tires by *long* nails. From these observed facts he concluded that rear-tire punctures are caused by the front tire turning objects on end, with the result that if the rear tire reaches them before they fall again, it is pierced. Experiments conducted over a track strewn with nails verified this theory; not only were the nails seen to act thus, but they were caught 'red-handed,' as it were, by a high-speed camera. The puncture-preventer designed as the outcome of these observations and experiments turns down nails as fast as the front tire turns them up, and so the rear tire is saved. The form of it suitable for motor-cycles consists of a specially constructed rubber-canvas flap, 3 inches wide, usually mounted on a scroll spring attached to a curved steel bracket fixed by one bolt through the fore-end of the rear mudguard, but occa-

sionally attached to the silencer or to a special adapter. The flap 'covers' the rear tire, and clears the road by half-an-inch. It lasts for about 25,000 miles, and can then be renewed cheaply. The puncture-preventer has kept the inventor free from punctures for 25,000 miles; previously he had forty-seven in 11,000 miles. On one occasion he rode for seven hours over a track strewn with thousands of nails. So long as the apparatus was in position, no damage was done; when it was removed, rear punctures came thick and fast. Forms of the preventer suitable for motor-cycles are already on the market; models suitable for cars and cycles will be ready shortly.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE PARTS MEN PLAY.

CHAPTER XII.—*continued.*

IV.

SELWYN looked down the stable, and in the dull light he saw the Hussar officer standing in the stall by the mare, crooning some endearing words, while the beast, in her delight, rubbed her face against his clothes and whinnied her plea to be taken for a gallop over the fields.

Not wanting to disturb him, or give the impression that he had been watching, Selwyn softly withdrew by a door near the dogs, and after giving Mathews a half-sovereign, made a circuit of the lawns and approached the house as if he were coming from the woods. As he did so young Durwent emerged from the stables, followed by a collie-dog that jumped and frolicked about him as he walked. Noticing the American, Malcolm crossed over to where he stood, proffering a cigarette.

'Have a gasper, Selwyn?' he asked.

'Thanks very much. I suppose it will be some time before the British Army will get into action?'

'I don't know, I'm sure,' answered Durwent, holding a match for the other, 'but three weeks at the outside ought to see us over there and ready.'

'The Germans have a tremendous start.'

'Yes, haven't they? Damned plucky of Belgium to try to hold them up, isn't it? Though, of course, you can't expect the Belgian johnnies to keep them back more than a few days.'

'You think, then, that she will be conquered?'

'Ra-ther. That's a cert. But I don't think it will be for long.'

'You mean that the British will drive the Germans back?'

'Not all at once, but sooner or later. Of course, I'm an awful muff on strategy—always was—but the general idea seems to be that we go over now and stop the bounders, and then our dear old citizens gird up their loins, train themselves as soldiers, and chase the Germans back to Berlin.'

'But—isn't it an open secret that your regular army is very small? Can you seriously expect to stop that huge force once it sweeps through Belgium?'

The Englishman picked up a stone and sent it hurtling across the lawn for the collie to chase.

'Ever play "Rugger"?' he asked.

'Rugby? Yes.'

'Then you've often seen a little chap bring a big one an awful cropper.'

'That is true, but the cases are hardly parallel.'

'Perhaps not,' said the other, rather relieved at not having to maintain the analogy any further; 'but, then, the beauty of being a junior officer is that one doesn't have to worry. I wouldn't be in old man French's shoes for a million quid, but for us subaltern johnnies it looks as if we'll have some great sport.'

As the two young men, almost of an age, stood on the rich carpet of the lawn with their figures outlined against the open background of the fields, they presented a strange contrast. The Englishman was dressed in a rough, brown tweed, and though there was a looseness about his shoulders that almost amounted to slouchiness, they gave a suggestion of latent strength that could be instantly galvanised into great power. When he moved, either to throw something for his dog or just to break the monotony of standing, his movements were slow and deliberate, and he took a long pace with a slight inclination

towards the side, as is the habit of cavalymen and sailors. His eyes were a clear, unsubtle blue, and though his skin was tanned from exposure to the elements, its texture was unspoiled. His hair was light brown, and, while closely cropped, in keeping with military tradition, was naturally of thick growth; in the centre where it was parted there was more than a tendency towards curls. From his lip a slight moustache was trained to point upwards at the ends, and beneath the tan of his face could be seen the glow of health, token of a decent mode of living and a life spent out of doors.

There was a frankness of countenance, a certain humour which one felt would rarely rise above banter, and the whole bearing was manly and attractive. But search the features as he would, Selwyn could not discover any lurking traces of undiscovered personality. Malcolm's very frankness seemed to rob him of possession of any hidden, unexpected veins of individuality. He was essentially a type, and of as clear Anglo-Saxon origin as if he were living in the days before his breed was modified by inter-association with other tribes.

Selwyn recalled the words of Mathews: 'Milord, you're a thoroughbred, you are.' . . . This youth was of a race of thoroughbreds. Maternal heredity had skipped him altogether; he was a Durwent of Durwents, and heir to all the distinction and lack of distinction which marked the long line of that family.

And opposite him was an American whose two generations of Republican ancestry led to the paths of Dutch and Irish parentage. Selwyn had never tried to discover the cause why his paternal ancestor had left the Green Island, or his maternal ancestor the land of dikes and wind-mills; it was sufficient that, out of resentment against conditions either avoidable or unavoidable, each had resolved to endure the ordeal of making his way in a land of strangers. Austin Selwyn bore the marks of that inheritance no less clearly than Malcolm Durwent bore the marks of his. In his features there was a certain repose, as became the part-son of a race that had produced the art of Rembrandt, but there was a roving Celtic strain as well that hid itself by turn in his eyes, in his lips, in his smile, in the lines of his frown. In contrast to the clear Saxon steadiness of Malcolm Durwent, his own face was constantly touched by lights and shadows of his mind, lit by the incessant prompting of his thoughts that demanded their answer to the riddle of life.

Although his build was fairly powerful, Selwyn's well-knit shoulders and alert movements of body spoke of a physique that was always tuned to pitch, but one missed the impression of limitless endurance which lay behind the easy carelessness of Malcolm Durwent's pose.

'I want to ask you, Durwent,' said the

American, 'more from the stand-point of a writer than anything else, if these men of yours who are going out to fight are actuated by a great sense of patriotism, or a feeling that the liberty of the world depends on them or—well, in other words, I am trying to discover what it is that makes you men face death as if it were a game.'

'My dear chap,' said the Englishman, with a slightly embarrassed smile, 'there again we leave it to the fellows higher up. Naturally, if Britain goes to war, it isn't up to her army to question it one way or another. Of course, back in our heads we like to feel that she is in the right—but, then, I don't think Britain would ever do the rotten thing, do you?'

'N—no, I suppose not.'

'You see, a chap can't help looking at it a bit like a game, for there's Belgium doing an absolutely sporting thing, and there isn't one of us that isn't straining at the bit to get over and give them a hand.'

With a slight blush at this admission of fervour, the Englishman grasped his collie-dog by the forepaws and rolled him on his back.

'But,' said Selwyn, unwilling to let the bone of discussion drop while there was one shred of knowledge clinging to it, 'supposing that Britain were in the wrong and you fellows knew it, yet you were ordered to war—what then?'

His companion laughed and thrust his hands in his pockets.

'Oh, we'd fight anyway; and after we had knocked the other chap out we'd tell him how sorry we were, then go back and hang the bounders who had brought the thing on. But then, you see, you're riding the wrong horse, because soldiering's my job, and I was always an awful muff when it came to jawing on matters I don't know anything about. You had better get hold of some of our politician johnnies—they've always got ideas on things.'

v.

A little later the Honourable Malcolm Durwent left Roselawn in a motor-car.

As it rounded the curve in the drive he turned and waved at the little group who were standing in the courtyard, and then he was lost to sight. And in the hearts of each of the three there was a poignant grief. Lord Durwent's head was bowed with regret that at Britain's call he had been able to give one only of his two sons. Dry-eyed, but with aching heart, Elise stood with an overwhelming remorse that she had never really known her elder brother. And Lady Durwent, free of all theatricalism, was dumb with the mother's pain of losing her first-born.

And as the heir to Roselawn went to war, so did the sons of every old family in the Island Kingdom. In something of the spirit of sport, yet carrying beneath their cheeriness the high

purpose of ageless chivalry, the blue-eyed youth of Britain went out with a smile upon their lips to play their little parts in the great jest of the gods.

Not with the cry of 'Liberty!' or 'Freedom!' but merely as heirs to British traditions, they took the field. Of a race that acts more on instinct than on reason, they were true to their vision of Britain, and asking no better fate than to die in her service, they helped to stem the Prussian flood while home after home, in its ivy-covered seclusion, learned that the last son, like his brothers, had 'played the game' to a finish.

Let the men who cry for the remodelling of Britain—and progress must have an unimpeded channel—let them try to bring to their minds the Britain that men saw in August 1914, when

catastrophe yawned in her path. That picture holds the secret for the Great Britain of the future.

VI.

It was almost the last day in August, when the little British Army was fighting desperately against unthinkable odds, that a brigade of cavalry made a brave but futile charge to try to break the German grip. The —th Hussars was one of the regiments that took part, and only a remnant returned.

Staring with fixed unseeing eyes at the blue of the sky, which was not unlike the colour of his eyes, the Honourable Malcolm Durwent lay on the field of battle, with a bullet through his heart.

(Continued on page 279.)

THE CARDINAL'S SON.

By NORMAN ANGLIN.

I.

FOUR hours after sunset rose the moon. As it floated out of the blurred mists covering the rice-fields and mounted into the clear sky, it seemed like a great silver globe glittering in the cold night-air.

There were scarcely any trees on the landscape, but along an embankment, raised only a few feet above the level of the rice-fields, ran the old royal road from Madrid to Santa de Jatellon. It being winter, the road was seared with great ruts, which were filled with ice.

A tremendous coach, all weather-stained crimson and gilt, rolled heavily as the wheels crunched through the icy ruts, and every now and again the cumbrous top-heavy structure would give a terrible lurch, so that it seemed it must overbalance and fall over the edge of the embankment. Six mules jogged steadily ahead, tugging unevenly at the traces, the steam from their nostrils floating back and around the coach; the coachman slept. Half a furlong behind the coach three horsemen rode wearily.

Inside the coach was dim twilight, for neither of the blinds across the door windows was drawn. Stretched on the back-seat, covered with rugs, a short, stout person was sleeping noisily. On the front-seat, beside a small leather trunk and a tray covered with broken food, sat a man muffled to the eyes in a dark cloak; whilst on the floor, among a great litter of clothing, including a large velvet hat with gaudy crimson feathers, a boy lay curled up, also asleep. The windows of the coach rattled as it lurched to and fro; two glasses jingled together on the tray amongst the broken food; the sleeper on the back-seat snored gruffly.

A series of unusually laboured snorts, and

this traveller awoke with a start, slowly sat up, glanced towards the windows, shivered. It was a woman, a dark-eyed, heavy-lidded southerner—beautiful; but her beauty was too matured, her full cheeks had lost their bloom, there was a querulous curl to her lips, and the modelling of her fine nostrils suggested inordinate pride—a woman of thirty.

Although she rearranged her pillows and tried to settle again, she quickly gave up the contest for further sleep and began shouting, 'Sem! Sem! Here, Sem, is there any wine left?'

The muffled man awoke, blinked drowsily, cursed under his breath for an instant, and then answered, 'Here is wine, your Grace. Will you take food?'

'I will. 'Tis only on a full stomach one can keep warm in this infamous vehicle. Is the boy sleeping?'

'He is, your Grace.'

'Be certain, for I would tell you something of which I have never before spoken. We approach the city, do we not? You said we should arrive before midnight.'

'The road is very heavy, your Grace,' the man murmured as a sudden lurch of the coach threw him against the tray, which he only just prevented from falling on to the sleeping child.

'It is this I would tell you, Sem—— But first put your head out of the window and see if the escort is within sight; sometimes the rascals will stop at a *fonda*, and then linger a couple of miles in rear. Put your hand through the front-window and pinch the coachman—you should do these things regularly and as a matter of course, and without my having to tell you; one would think you had never travelled before. Now give me all your attention—— Sem! are you listening?'

'I am listening, your Grace,' replied the man wearily.

'That child is asleep?'

'He is sound asleep, your Grace.'

'Sem, do you know who he is?'

'Why, he is your Grace's page-boy.'

'Fool! He is the cardinal's son.'

'What is your Grace saying? Not Cardinal José?'

'Who else, fool? Don't stare at me like that, or I will have you whipped. I was a young woman eight years ago. But enough of that. Now, listen to what I say, Sem. We shall be driving into Santa de Jatellon while men are asleep—that is, if they do not delay us at the gate. The coachman knows the way to my sister's house, and one of the men of the escort—look again if they are within sight!—one of the escort, Sem, will attend me out of the coach on my arrival at my sister's house. You must go straight to the Archbishop's palace—but first pluck one of the feathers out of the hat on the floor there.' The duchess's steward leant forward and reached for the crimson-plumed hat. 'Sem! carefully, man. Do not spoil my hat. Go to the Archbishop's palace and nail that crimson feather to the door. Don't gape at me like that, fellow! Am I an idiot that I should litter my coach with nails, hammer, and a great plumed hat? Nail that feather to the door of the palace; you understand? Then come quickly to my sister's house and tell me that it is done. I have not seen my sister for five years, not since José was appointed to Santa de Jatellon. You remember him when he was chaplain to the king? And you suspected nothing. Did you suspect, Sem?'

'I suspected nothing, your Grace.'

'I was never sure. You were a faithful steward, and I feared that had you known you would have told the duke. Silence, fellow! You would have told my husband for certain. You were his steward before you were mine. I have been able to trust you only since his Grace died. But when I took the boy for my page, six months ago, what did you think then?'

'I thought he was your Grace's page.'

'You were always a fool, Sem; but fools are faithful. So now you know where I am going to get the five thousand doubloons that are required for the estate. Sem, how far are we from the city? Lean out of the window. Can you see the trees that grow along the banks of the river?'

II.

There were more than one secret stair in the Archbishop's palace at Santa de Jatellon; and it so happened, at the hour when the great coach of the Duchess Aduana was being admitted to the city through the Castellon gate, that Cardinal José was not alone in his room.

The cardinal was pacing to and fro across his bed-chamber noiselessly. Half-a-dozen candles guttered on a centre table, on which was spread out an immense chart, decorated with dolphins, galleons, and an elaborate representation of the mariner's compass. At the table sat a tall, gray-bearded Spaniard—El Capitan Ximenes Calomarde, commander of a galleon lying in the harbour of De Jatellon, waiting to sail for the Spanish Main.

When they spoke, the two men addressed each other almost in whispers. Every now and again the cardinal would pause in his restless pacing and stand opposite the table. Although it was never referred to, the secret between the two men was that Cardinal José—having substituted glass for the precious stones in the saintly shrine of the cathedral—had found the gold wherewith the expedition had been fitted out. The cardinal was ambitious, desiring power; he looked forward to returning to Madrid and dictating the policy of the already failing king, or—better still—of his youthful successor.

Over his night-shirt the cardinal had thrown a purple cassock embroidered handsomely with thread of gold. He was a heavy-shouldered man with long, powerful arms; piercing black eyes burned in a face that was unhealthily pale and yet strongly moulded. An aggressive face—and his action was aggressive as he stopped suddenly beside the table and smote it heavily with his lump of a fist.

'I would I were going with you, Ximenes—to be free of all the petty grovelling that everywhere surrounds me.'

'You would make a sailor,' *el capitan* replied, as he laid aside the lens with which he had been examining the New World.

'Should I? You think so? Ah, Ximenes! to meet men as equals, to assert one's individuality without relying on the weight of one's position! To be free of all the trammelling consequences of position! Oh, it is terrible to go on and on, to have to go on always, strengthening not one's personality but one's position!'

'But why—why—why not?'

'Yes, why should I, Ximenes?' Suddenly the cardinal stopped speaking. His keen ear had caught the sound of hasty knocking that ceased as abruptly as it began.

El capitan sat behind the candles watching the cardinal's face, waiting for him to say what he had been about to say. But Cardinal José turned and approached the window; he drew aside the heavy curtains and peered through the casement down into the street, looking towards the gate of his palace, for his sleeping-apartment was situated in the upper storey of a tower that stood at a corner of the building. Then *el capitan* watched the cardinal throw the window open; the candles guttered heavily; some papers lying on the chart fluttered and glided to the floor.

When *el capitan* had recovered these papers and arranged them again on the table, he saw that the window had been closed, the curtains drawn again, and the figure of the cardinal was disappearing through the concealed doorway that opened on to the secret stair descending to the gate.

Down the narrow stone stairway the cardinal groped his way. He was wondering greatly, for he had caught sight of a cloaked figure hurrying away from the gate down the street.

A few minutes later he was returning, groping his way back to his apartment.

A crimson feather! Nailed to his gate! So he had a son. He had often suspected the fact, but why had the Duchess Aduana waited all these years before revealing her secret to him? Well, he was glad. He had always wanted to have a son, one who would grow to be a man, whom he would train himself, who would gain by his experience and profit by his mistakes.

The cardinal thrust the feather under his cassock before he stepped out into the candle-light again.

'Ximenes, I may come with you yet. You sail at dawn to-morrow? Good! To-day send me a suit of sailor's clothing and a sailor's cloak.'

The cardinal's eyes burned fiercely in his pale face as he grasped the hand of the man who had risen eagerly from the table.

III.

Sunlight streamed into a long, low room richly hung with old brocades and furnished with heavy high-backed walnut chairs; on a side-table was an array of massive gold plate, and behind the gilded arm-chair that stood on a dais at the end of the room hung a great curtain of embossed leather, all black and crimson.

The cardinal was receiving the Duchess Aduana in private audience. The duchess was attended by a single page-boy. Every one, even the cardinal's secretary, had been ordered to leave the apartment.

'Five thousand doubloons, Isabella! It is impossible—impossible, I say.'

'But think, your Eminence. You surely remember the letter from the French ambassador that, years ago, you removed from the king's mail-bag before it reached His Majesty?'

The cardinal, always pale, grew ashen gray; only, his eyes seemed to burn more fiercely in his face. The duchess continued: 'You remember also that you lost that letter? But you did not know that it was I who stole it from you. José, that letter is worth more than five thousand doubloons to you.'

'Woman! I have already taken the jewels from the shrine of our saint; the silver bell of Santa Antonia has already been recast; but——You say I can have the boy?'

'Surely! I can do little for him. I had not thought you would desire to have him. But

I must have five thousand doubloons, your Eminence.'

'Ah! Then there is only one way left. Yet that way even I shrink from following. But if you will help me—remember, Isabella, I am to have the boy—if you will help me, I will try that way.'

The Duchess Aduana was silent; but Cardinal José had risen from his chair, descended from the dais, and was pacing up and down the audience-chamber.

'It is this, Duchess Aduana. From one archbishop of Santa de Jatellon to another there passes a secret—a secret guarded for two centuries by many seals, even the key to a great treasure—but the occasion has not yet arisen when any prelate has dared to use it. In the tomb of one of my predecessors lies a great treasure. It was amassed by an unworthy priest; it was buried with him. Now, you will come to the little door in the south wall of the cathedral to-night, and you will bring our son with you. Then you and I will slide back the stone of the tomb, and I shall give you the value of five thousand doubloons, and you will give me the letter and—our son.'

Cardinal José stopped suddenly in his restless pacing, stopped before the child, and, lifting him, held him at arm's length, his eyes bent on the frightened face of the little page-boy. 'Yes,' he exclaimed at last, 'he is the cardinal's son!'

An expression of amazement came into the petulant, haughty face of the woman who had once been a famous Court beauty, as she watched the cardinal gently lower the child to the floor and gravely stoop to kiss his brow.

IV.

The footsteps of the cardinal echoed noisily in the darkness of the great silent cathedral as he made his way to the little door in the south wall of the choir. The sound of his footsteps resembled anything rather than the quiet, quick shuffle of a priest in some holy place; and instead of his cassock the cardinal wore a great cloak of a coarse material. In his hand he carried a tall candle in a jewelled ecclesiastical stick—only the cardinal knew that the jewels were false.

In a few minutes he was retracing his steps, but now he was followed by two figures—the bulky one of a stout, heavy woman, and a slight one that could only be a boy's slim form.

The cardinal led the way up into the choir; past the gloomy stalls of the choristers that in the candle-light seemed to the frightened child like a row of tall, ghostly, shivering figures; past the great oaken lectern with the stout candles set on either side of the great books, and up steps to the presbytery. There, close to the high-altar itself, he stopped before a simple stone tomb, bearing no effigy, but only a long Latin inscription on the great slab that formed the side.

The cardinal placed the candlestick on the pavement beside the tomb, and, kneeling, groped along the dusty masonry of its base. The Duchess Aduana was amazed when she noticed he was wearing heavy top-boots of coarse, unpolished leather. She watched him until he suddenly straightened himself on his knees; then he leant against one end of the tomb's side-slab, and it gradually sank inward, hinging on a pivot, so that the other end swung outwards.

The cardinal seized the candle. The duchess could not restrain her curiosity; she too knelt on the pavement, and they both peered into what, however, seemed to be an empty space.

'Perhaps, José, the lower stone moves also,' she murmured, creeping a little closer towards the opening.

For a moment the cardinal did not reply; then he turned to the boy, who was standing behind them, and exclaimed in a hoarse whisper, 'Run to the lectern, boy, in the choir there, and bring me one of the candles.'

As the child hurried away the duchess turned to the cardinal petulantly: 'So the treasure has been stolen!'

'No, Isabella; no, no. See! you are nearly in the tomb. Creep a little farther and feel if you can discover a ring sunk into the second of the pavement stones. No, the next one, a little farther.'

The duchess was already more than half-way into the tomb, when the cardinal turned to the boy and took from him the candle that he had secured, whispering at the same time, 'Run back again, boy, back to the lectern, and bring the other candle also.'

The cardinal's son hurried away across the pavement, trying not to look into the shadows clustered everywhere about and before him. Down the steps from the presbytery to the choir he ran, climbed the wooden steps to the great lectern, and drew the second candle from its socket. Then he ran back to where the cardinal was rising from his knees by the tomb.

'Here, boy! Take both the candles and place them again where you found them. Quick, sirrah!'

But the boy hesitated, frightened by the harshness of the man's whisper, glanced past the cardinal at the tomb, and then his eyes were raised to the ghostly silver figures, faintly lit in their niches on the reredos by the flickering light that the cardinal held. He had heard a sudden muffled scream, but he could not see the duchess, his mistress, anywhere. The cardinal was pushing him towards the steps leading down into the choir. Again he heard a muffled scream. Utterly terrified now, he hid his face in the cloak of the man urging him down the steps. Losing his footing on the steps, the boy stumbled, and falling, tripped up the heavy man to whose cloak he was clinging. And the cardinal fell headlong with him.

The body of his son broke the cardinal's fall on to the hard marble pavement at the foot of the presbytery steps. The candlestick shot out of his hand. He slowly picked himself up, groping in darkness. For a moment he stood listening. Yes, he surely heard a faint moaning—but it was not from the figure at his feet, which was utterly silent.

Stooping quickly, he lifted the boy in his arms and hurried towards the vestry and the door communicating with the palace, only stopping his hurried flight from the inky vastness of the cathedral when he found himself again in his bed-chamber. Even then he still heard in his ears the sudden muffled scream from within the tomb that he had closed.

Candles were burning on the table; he advanced slowly and held the face of the boy he carried to the light. For a long while he stood, not even the muscles of his face or his eyelids quivering, gazing down on the little head that was bent stiffly and unnaturally towards one shoulder. At last the cardinal crossed the room and laid the body of his son upon the bed.

V.

So soon as it was daylight there was a great firing of cannon from the harbour, where the galleon of El Capitan Ximenes Calomarde was setting sail for the Spanish Main.

When the monk who was the cardinal's secretary hurried into the bed-chamber to waken his master, he shrank back amazed, doubting the witness of his eyes.

He saw four great candles burning about the bed, on which a small figure was lying, laid out as though for burial. And then he saw that beside the head of the bed a solitary figure was sitting, as though watching the corpse—a man in coarse clothes, the hood of his cloak drawn over his head, which was sunk to his chest. So still did he sit that the monk hardly dared to approach him.

At last, having spoken holy words in Latin several times, he approached the figure and threw back the hood from the face. It was the stern white face of Cardinal José that he saw, yet curiously unrecognisable, for the lids were lowered over the piercing dark eyes. The lips were pale, and the whiteness of the cardinal's face was as the whiteness of wax.

SEVENTH SERIES

THE INFRA RED RAY.

By 'R.E.'

PART I.

I.

IN the autumn of 1916 I found myself stranded at Abbeville *en route* for Boulogne and leave in England. On my way to the '*Tête de Bœuf*' in the evening my thoughts turned on my friend Grant Haswell, and I wondered what part he might be playing in the world-war. Imagine my surprise, then, when the waiter was gone to bring coffee and I was scanning the cosmopolitan crowd one meets in that well-known hostelry, to see Haswell himself sitting at a small table, wearing the uniform of the Royal Engineers!

He caught my eye at the same moment, and came over, smiling, to shake hands. 'I'll join you if I may, old thing,' he said gaily, hanging his Sam Browne on a convenient hook and holding up two fingers to the waiter.

I expressed my pleasure at seeing him, and asked him if he was on the same errand as myself.

'Yes; I've got ten days this time, and am going by the Boulogne route—special leave, like yours. Don't ask me that,' he said, as I looked at him questioningly. 'You're so beastly frightened you'll lose that pass that you put it in your cigarette-case, which you've opened once and felt at twice since we sat down. In fact, Craven, you're a bit jumpy—which isn't to be wondered at after the knocking about you've had on the Somme.'

'Why, I haven't seen you since, with my humble aid, you caught old Von Hilsener, the spy, just before the war; and I certainly haven't said anything that wouldn't pass the censor in my letters.'

'No; but you are still wearing the flash of the Nth Division, and I know you are Brigade Signals, and that your division was on the Somme and amongst it.'

'You're about right, Haswell; we had a rough time—all of us. Now what about you?'

'Well, I've had several jobs in the last two years; but, if you like, I'll tell you about one which will interest you, as an officer of the Signal Service, and as an old colleague in the gentle art of spy-hunting.'

Knowing Grant Haswell as I did for one of the cleverest amateur detectives England has

produced, I nodded eagerly. The son of an English country gentleman, a shrewd student of human nature, an accomplished linguist, Grant Haswell had two favourite hobbies—applied science and mystery-solving, in both of which he excelled. When he could combine the two Haswell was at his best; and from his last remark I gathered that the adventure he proposed to relate was a case in point.

'Go ahead,' I urged.

II.

'I dare say you've noticed how news gets across to the old Boche,' he began, 'generally in about three days (which usually doesn't matter much), but sometimes nearly crisp from the hob and in time to allow him to anticipate a move of ours, or to shell a new trench-mortar position or O.P. even before it has had a chance to do any useful work. I divide this information under two headings—purely local news, and news of large movements over big areas. Now, you may have heard that where the line runs through the colliery area, notably opposite Lens, there was some time ago a considerable leakage of news of our movements to the Boche.'

'For various reasons, but mainly because General Vernon (whom you knew as a captain) was aware of my interest in this sort of work, I was selected to try to trace this leakage to its source. My knowledge of French was a recommendation, and, as you know, I have also a fair grasp of German. I was given information as to what had been done already, and was frankly told that all theories tested had broken down, and that over a front comprising five sectors, with Grenay as a centre, our work was always interfered with by shelling, fire from fixed rifles or machine-guns, &c. I asked by what means it was supposed that news was getting over to the enemy, and was informed that the mine-workings had been suspected as having an outlet into territory occupied by the Germans. The positions of outlets on our side were known, and had been watched or stopped up by explosives after consultation with the mine directors. Other workings were flooded and impassable. A watch had been kept for lamp and smoke signals, and buried electric-power cables had been tapped

and "listened into." In fact, signals of all kinds, including semaphore, had been closely looked for, as the news must have arrived in great detail and fullness at the German headquarters. Aircraft photographs were ruled out, because movements invisible from the air had been included in the leakage. The Boche listening apparatus or amplifying telephone could not have got it, as some of the units concerned in the work never used the 'phone, nor had directions been given otherwise than on paper to the O.C. Having got this and such other information as the general could give me, I left his place with *carte blanche* to try my luck.

'From the first I agreed with the rest that some very excellent form of telegraphy was probably the means by which the news got across, but how it was worked, and by whom, seemed to be the puzzle. There was little doubt that the centre of operations was near Grenay, and near Grenay there was a very large civilian population engaged in working some of the mines within easy range of the Boche light artillery, which seldom disturbed them, though occasionally it dropped a few shells about Les Brebis, Mazingarbe, and Bully Grenay.

'Now, supposing the installation were in this district, what form could it take? There were four feasible forms—wire, wireless, pigeons, and visual. Of these the last appeared to me the most likely. Pigeons, or wireless with its noisy generator or accumulators to be charged, seemed too likely to be detected for the wily Boche to use them. To search for wires or old buried power-cables entailed an endless quest, and from the German point of view, this method appeared too easy of detection, as our listening sets could have picked up signals by either means; so I decided to look for some sort of visual.

'A lamp in a rifle-barrel flashing Morse signals can be read with a telescope at two miles under certain conditions; and if the barrel is blackened, it has a very narrow angle of dispersion. Such a device would, however, have had to be worked from near our front line to avoid detection, and answered in some way by the receiving-station. I considered that if this means had been used, it would have been discovered by the very sharp watch kept during the last few weeks.

'Suddenly it occurred to me that the Germans might have perfected an idea which was worked on by a friend of mine in 1915, but which, I believe, was never made use of by us. The principle was to send out a concentrated heat-ray and pick it up with a thermopile. Now, a thermopile is, as you know, an instrument of extreme delicacy. With it the heat given out by, say, a cow in a field can be detected from a distance of 200 yards! If the source of heat were great and a powerful lens system introduced, a concentrated heat-ray could be produced capable of affecting a thermopile at a very considerable distance, say in the German line. The system

would be workable day or night, and invisible and unreadable without special apparatus. Supposing the "infra red ray" or any similar system to be the one employed, it appeared well-nigh impossible, even if I obtained the necessary receiving-apparatus, to pick up signals in transit, owing to the extremely narrow pencil of rays which would be used, and the fact that the stations would probably be placed high up on the rising ground, making interception from our front line or anywhere near it impossible; for, as you will remember, the line runs along the valley on the whole of this front.'

III.

'Having settled that the difficulties of interception were too great,' continued Grant Haswell, who had paused to light a cigarette, 'I decided to confine my attention to the discovery of the sending-station on our side. To walk about in daylight on the front slope of our position facing the Germans was suicide, and would have probably flushed the game, anyhow; so I employed the day in making myself conversant with the network of trenches in front of Grenay, and studying the trench-maps for likely positions for signal-stations. I took no trouble to disguise the fact that I was engaged on the work, believing that even if I did not prevent the spy carrying out his reconnaissances, it would put him at his ease, should he become aware of my existence, so long as I made no attempt to approach his suspected hiding-place. After some days I was generally known throughout the five sectors to be in search of the "Boche signaller," as he was called, and regularly chaffed at the various Messes.

'I then altered my tactics, and instead of going about in the front and support lines, frequented the almost deserted reserve line. There were several fine O.P.'s there, and I used to look forward at the hills near Lens and Vimy and think how any point would do as a receiving-station, provided the apparatus used had the requisite range. I came to the conclusion that it probably had not, and began to examine more carefully with my binoculars the various chimney-stacks and pit-head gears nearer the lines, both on our side and on that of the Boche.

'On the German side there was a pit-head, known as Fosse 16, long suspected as a centre of German observation and fire-direction, though it looked battered and deserted enough to allay any suspicion on our part. Opposite, on our side, were several similar battered pit-heads, and one of them, Fosse 11 of Béthune, was close on my right. This was in a better state of preservation; and though nobody could safely approach it in daylight, I knew of several important projects which were in full swing there.

'As I lay in the long grass and poppies and looked over this deserted and shell-pitted ruin of French enterprise, it struck me that its piles of

timber and extensive *crassiers* (pit-banks or dumps) would be just the place to conceal the sort of station I was looking for. I was lying a few yards from the trench, and had taken no pains to conceal myself, as the grass made me invisible from the front. Two dull bangs from somewhere in the German lines, a loud hiss, and two splitting explosions a few yards off made me tumble into the trench and run down a communication-trench at right angles, just in time to avoid two more shells pitched close to the last. Those shells had been fired to close direction, and had been fired at me, I was sure. I was also fairly sure that they had been directed from somewhere near Fosse 11 of Béthune. I was surprised and flattered, too, that the Germans should think me worth four shells.

'Next day I went and examined the place where I had been lying, and discovered in the chalk-dust near by the footprints of a man in Ordnance "issue" boots. The hardness of the ground, and the fact that he had gone away by the trench on the "duck-boards," made following up the "spoor" impossible, and I continued my way to a private O.P. at an R.E. advanced headquarters, near the support-line. On the way back I was walking along the trench with my steel hat off, when two cracks, one at a few hundred yards, and the other apparently a foot from my ear, made me duck instinctively. The north side of the trench here was low, and through a gap in the grasses I saw Fosse 11 and the brick-stacks framed before me. Those were rifle-bullets aimed at me. I sat down and drew a pencil-line on my trench-map through the fosse, and the point in the trench where the bullet hit.

'Two days afterwards I was getting on to my "Douglas" at the signal-test station near the outlet of the communication-trench, when a bullet chipped the angle of a ruined house behind which I used to leave my bike, and went through a gate opposite. I drew in that line also on my map, allowing for a slight deflection of the bullet.

'That line produced intersected the previous one in the brick-stacks near Fosse 11. That night I smoked several pipes over the matter, and came to several conclusions. The outstanding one was that whoever was behind our lines not only knew that I was after him, but feared me sufficiently to take considerable risks to put me out of the way. Possibly he had met me face to face in the trenches, as he probably had a British uniform and must move about to get his information. Again, assuming he was lurking near Fosse 11, he could easily have recognised me with glasses as I lay in the grass on the day of the shelling, or passed the low-sided portion of the communication-trench on the previous day. Now, why should he risk detection by shooting at me with a rifle in broad daylight? The others had not been molested. Evidently he had heard of me before

in connection with some other investigation; and somehow the Von Hilsener case came into my mind at the moment, and I remembered how the Press got hold of my name and published my photograph broadcast along with that of the notorious spy.

'This German was evidently a picked man, as Von Hilsener had been, and I smiled as I wondered if he would prove to be a friend or a co-worker of his in their secret service. If I was recognised, the fact that I was Grant Haswell, who ran down Von Hilsener, was of course sufficient; but something told me there was more behind it all.'

IV.

Grant Haswell puffed contentedly at his cigarette for a moment or two ere he resumed his narrative.

'The investigation,' he went on, 'had now narrowed down considerably, for it was certain that if the person who worked the signalling was the same as the one who had twice fired on me, he must be concealed somewhere near the fosse or the brick-stacks. Such shooting was unlikely to be at greater range than 400 yards. He also had the advantage of knowing me and my not knowing him, so I determined to shift my headquarters and alter my appearance from that of an officer on the general list to that of a sapper of R.E. Next day, having gone *via* Bruay on the "Douglas," and the latter part of the journey on foot in sapper attire, with a pack, &c., I established myself at Philosophe, in a ruined house, and sent an orderly to a friend in the I.D., asking him to bring a revolver and join me in Tommy's kit at 10 P.M. that evening. I promised him some fun, and expected it. Jessop is one of the best revolver-shots in the army, and a jolly good sportsman.

'We left Philosophe at ten, and got into "Northern Up" trench, turning eventually into "London Road," and were soon in the "Maroc" sector. It was full moon, and very clear except for a few fleecy clouds which occasionally blurred the heavy shadows cast by the moonlight. On the way along "Calonne North" we met Bracewell's sergeant, who is a first-class signaller and a very decent fellow.

'I had asked him to join us, if he could spare the time. He told us that his main "Test Point" had been wrecked that afternoon by a 5.9, and that he had been putting his lines through by alternative routes; he was tired, but would be pleased to come along with us.

'We outlined our plans, and impressed on him the necessity of great caution in approaching the supposed lair of the Boche. My idea was to go quietly to some point near Fosse 11, and lie there listening carefully for the working of any mechanical part of our friend the spy's apparatus; to do this nightly till we had covered all the ground in earshot; and, in case of failure, to try

something else. If the "infra red ray" were being used, an insulating shutter would have to be introduced to produce the Morse signals, and it was unlikely that this would be absolutely

silent. The sending-key of any sort of apparatus would give slight sounds which might be detected by close listening.'

(Continued on page 300.)

A MEDICINAL HERB-GARDEN.

By HARWOOD BRIERLEY.

A COMPLETE herb-garden such as the writer has the pleasure of tending would contain at least thirty-nine kinds of plants. None of these would be ordinary vegetables such as onions, or green salad like lettuce; there would not be a single drug-plant such as foxglove, belladonna, or stramonium, as these things are toxic, whereas all herbs are beneficent, or at least harmless. The medicinal herb-garden should show at least thirteen old-world curatives of high reputation, not one of them resembling rank weeds growing by waysides—agrimony, betony, and yarrow, for instance—but all responding to the arts of cultivation, as they did in medieval times and in monastic gardens. Adjoining the herbs medicinal there would be considerable space devoted to salad, seasoning, or pot-herbs designed, possibly, in part for the market. Among these would be sweet basil, herb-burnet, chervil, sweet cicely, chicory, chives, corn-salad, fennel, land-cress, marjoram, parsley, purslane, sage, herb-savours, sorrel, spearmint, common green mint, tarragon, common thyme, and lemon thyme. The scent, spice, and seed herbs would be angelica, aniseed, caraway, coriander, dill, lavender, santolina, and southernwood.

As regards the purely curative herbs, their reputation appears to have been half-ruined by astrologists, casters of horoscopes, compounders of simples, and elderly country residents who believed their education was complete. The real, the unchanged and unchangeable, value of these medicinal plants to any household in the parish was well known a very long time ago to the saintly George Herbert, pastor of Bemerton, who acted as physician alike to the souls and the bodies of his parishioners. As disease cannot be touched by herbs, George Herbert alleviated or cured the ailments to which his parishioners were prone before virulent disease attacked the tissue-matter, and hereditary maladies were kept under by this means without resorting to drugs, the continued use of which will ruin any constitution. Through the present writer's herb-garden—for centuries a waste of stones, nettles, thistles, hogweed, &c.—goes a semi-private road which the parishioners and visitors use at their pleasure, and while some of the older folk do not hesitate to ask for any herb they fancy when passing by, they often vouchsafe in return information regarding their experiences of some particular species in the past, and what deceased kinsmen or old friends used this or that herb for.

Balm (*Melissa officinalis*) heads the list alphabetically and also in popular esteem. This particularly homely old favourite of our forebears is seen in comparatively few gardens to-day, and is seldom used by well-to-do people in good faith. A hardy herbaceous perennial, it may be grown from seed, or propagated by means of side-shoots or root-divisions. It does quite well in poor soil with a north or an east aspect, and will even sow itself in old stone walls, like hyssop and pellitory. When once established, a clump of balm will last for many years, and will endure a deal of cutting back without apparent injury. The leaves are not large; they are soft, dark green, fragrant when crushed, and contain a volatile oil. The leaf-stalks are cut off in early autumn, and dried partly in the sun, partly in the shade, for winter use. Balm-tea is a hot infusion of the leaves, green or dried, with a little sugar added. The odour of balm is very mild and agreeable, quite distinct from that of any other herb. Melissa, as the botanical name of balm, is taken from Princess Melissa, daughter of a king of Greece, who, along with her sisters, nursed the infant Jupiter, and beat upon bronze pots and pans to attract bees. These insects came daily to feed the infant deity on honey derived from the syrups of balm, thyme, and similar plants. Melissa has since become a synonym for 'honey-bee'; it is used as a Christian name, and is the generic name of balm. All balms and balsams are emollient and demulcent; they assuage pain and heal. Eau des Carmes, or carmelite water, and the balm-wine praised centuries ago by John Evelyn of Wotton Manor, are got from this beneficent herb. The 'tea' is a tonic and a stimulant, promoting cheerfulness. It is used for indigestion, for headaches, for vertigo, and overheated blood; also as a sudorific in colds and incipient fever. It should be mentioned that the 'Balm of Gilead' in Holy Writ is a resinous substance.

Borage (*Borago officinalis*) is, or was, 'used in medicine,' as the specific name *officinalis* tells. Is it possible to state expressly when and how suffering mankind should use borage to-day? It is easily grown from seed, or a plant left standing will sow itself after the seed has ripened, with the result that borage usually looks like an escape from a flower-garden, with intense blue drooping flowers and a very rough, hairy foliage. As a blue flowering plant it is, however, superseded in every respect by the taller, bushier, and more brilliant *Anchusa italica*, and bees resort

to both. There is no objection to the extremely cool and juicy young leaves of borage being used as a salad. The old herbalists employed them in making a cordial which acted both as a sudorific and as an expectorant. We must admit that borage is a little out of date as a tonic and an exhilarant with some slight intoxicating power (hence its place as an important ingredient in 'claret cup'—a not too heady beverage sipped by the fair sex at early Victorian balls). The flowers and the leaf-juice were stirred into negus and into cool tankard, the latter being a mixture of wines, lemon-juice, borage, and sugar. The motto of borage is, 'I give courage,' perhaps of the Dutch kind!

Chamomile (*Anthemis nobilis*) was first recommended early in the Christian era by that renowned physician Asclepiades. Perhaps no other plant used for common medicinal purposes to-day has such a time-honoured reputation. It stands pre-eminent in the catholicon of herbs, and in the herb-garden is a regular crop. Chamomile is a native of Britain, a plant of very easy culture, flourishing on almost any soil, and is usually propagated by dividing the roots in spring, and planting them six to nine inches apart in an open situation. The name chamomile signifies 'earth-apple,' owing to a fancy that its fresh blooms have an apple-like odour. Although the whole plant is odoriferous, its virtues are concentrated in the double flower-heads, which have to be gathered as they come forward, spread out, and dried gradually before the florets are fully expanded. The blooms will keep on appearing for some months.

Chamomile-flowers grown in the land of lavender and peppermint, about Mitcham and Hitchin, used to fetch any price up to £9 per hundredweight before the great European war. Put up in penny packets, now sold for three-pence each, these were circulated in great quantities throughout the United Kingdom, and found their way even to the smallest village shops. Chamomile-tea, which settles as clear as Scotch whisky, is a bitter aromatical tonic of the first order—quite the correct thing for indigestion, headache, flatulence, and kindred ailments. It alleviates pain, reduces excessive perspiration, prevents nightmare, promotes peaceful sleep. It is requisitioned for spasms and colic, and as an antidote to the excessive use of tobacco. A strong infusion is emetic, and a weak infusion in small doses is good for infantile diarrhoea, as also for pains when teething; and its action is carminative and anodyne. Hot fomentations are used for toothache, face-ache, and neuralgia; for inflammation of the bowels; for burns, sprains, &c.

Comfrey (*Symphytum officinale*) is by no means an ordinary herb, and it is employed for rather unusual purposes. Sometimes it crops up like an outcast near old-fashioned country-seats, or as an escape from a neglected herb-garden, but is perhaps oftener seen in the background of a

herbaceous border, where it is pointed out as a curiosity. Comfrey becomes a bushier plant than foxglove or mullein, bearing pendent lilac flowers of unusual shape. 'Kumfri,' as the pronunciation goes, is, in the first place, demulcent and expectorant, the home-made comfrey-beer of Nottinghamshire being a popular beverage, considered useful for loosening phlegm and acting on the kidneys. Quite recently this herb was described, by one who had prescribed its use for half a century, as one of the most valuable species growing on God's earth, and as a perfectly safe medicine in all cases of inflammation of the lungs, stomach, and kidneys. Its root or its leaves can be made into a lotion for neuralgic pains, and into warm poultices for pulmonary complaints, bleeding of the lungs, &c. 'Knit-back' and 'knitbone' as local names agree with the generic term *Symphytum* or *Symphytuma* of botanical science, derived from a Greek verb meaning 'to unite' (that is, fractured or broken bones); moreover, 'comfrey' is undoubtedly a corruption of the Latin *confero*—meaning 'I bring together,' or unite. Accordingly our forebears employed it as a vulnerary in painless surgery; indeed, many bone-setters to-day apply poultices of powdered comfrey-root in all cases of fractured or broken bones. A little juice from the raw root squeezed into a fresh wound will help to unite the fibres of torn flesh as readily as anything which can be purchased at the pharmacy.

Garlic (*Allium sativum*) cannot be deprived of a place in the medicinal herb-garden, as it is something very much more than a seasoning or flavouring bulb (used in Spain, Italy, and France to excess, maybe) with a rank, clinging odour. The large, white-skinned, compound bulbs are sold by seedsmen and bulb-merchants in February and March. Each one is broken up into about ten 'cloves' to be planted separately early in the third month on light rich soil six inches apart. When the leaves wither the whole crop is taken like shallots, dried in the sun, and stored. To-day garlic is more used than ever by doctors and nurses; during the war it was in constant and increasing demand, sold and bought by the ton. The Hindus have used garlic-plasters for ages. For the sores and wounds of soldiers in France garlic-juice diluted with three or four parts of distilled water was the standard dressing. Many modern antiseptics used in fashionable practice injure the tissues, but garlic applied to a wound stops the infection and quickly heals. It is also considered a certain cure for jaundice. Sufferers 'as yellow as a guinea' have been rubbed from top to toe with garlic-juice and lard, the result being astonishing. Tuberculosis may be prevented if it is eaten regularly, and it is even regarded as a capital remedy for consumption in the early stages.

Horehound (*Marrubium vulgare*) means 'hoary-leaved, strongly scented plant,' its leaves being downy, gray, and, for a common medicinal

herb, large. Grown from seed, slips, side-shoots, or root-divisions, it may be made a paying crop if cultivated in a business-like manner on a rather moist loam. For use at home two or three roots would probably be sufficient, all the best stalks to be cut off at the end of summer, and dried.

- Well-made horehound-beer possesses stimulant and tonic properties which put in the shade all chemically compounded drinks and aerated waters. Manufacturers of candies, lozenges, and other sweetmeats have long used both horehound and common wild coltsfoot for the same purposes. They are described as pectorals, and used abundantly for debilitating and chronic coughs, also for asthma.

Hyssop (*Hyssopus officinalis*) is of the easiest culture, from seed or otherwise. Sometimes it is found growing on ill-cultivated soil in unlikely places, even on mouldering walls of long-lost monastery gardens; and it looks quite at home adhering in clumps to the sides of neglected stone-built garden walls. Here we have a very nice little aromatic evergreen herb which bears fragrant violet-blue flowers. The monks of old may have been specially attracted to it because of its sacred associations as a Bible-herb—*ēzōph* in the Hebrew, *hyssōpos* in the Greek. Probably this particular *ēzōph* was implied when the inspired writer prayed, 'Purge me with hyssop and I shall be clean.' Although containing an essential oil, it is not exactly an aperient, but rather a cleanser of phlegm and other impurities, such as clogged pores of the skin, by means of increasing the perspiration. Our fore-elders used to gather the leafy tops with their capsules at the end of summer and dry them for an infusion called hyssop-tea, whose qualities were tonic, stimulant, diaphoretic, &c. Children were given a weak infusion when being nursed for measles; adults drank it at full strength for hoarseness and huskiness, feverish colds, and even coughs.

Pennyroyal (*Mentha pulegium*) is a very ordinary-looking, creeping, mint-like, little plant used medicinally for at least 2000 years. Its root-stock will travel a long way in a damp low soil, and will need ruthless checking if space is much limited. The English name appears to mean 'royal penny mint,' but not from the legend that Queen Elizabeth used to purchase a pennyworth frequently at the stalls of poor women standing in Covent Garden Market, for the term was in use before her day. Only the leafy stalks are sold for medicinal purposes. Pennyroyal is a stimulant, a diaphoretic, and emmenagogue, most useful for nervous affections, giddiness, female irregularities, hysteria, and—may we add?—brain disorders. It is also a good blood-purifier. Lancashire pork-butchers often make the flavour of it very marked in their black puddings, of which the famous Bury variety in particular is considered a great dainty throughout the north of England.

Peppermint (*Mentha piperita*) has long been

a paying crop round about Mitcham and other districts where lavender, dill, and caraway are grown to such perfection. Like spearmint and pennyroyal, it may be started in any naturally moist, shady, or enriched sandy soil by inserting pieces of its running white-stock, and the laws which govern its successful growth are quite uncomplicated. Black peppermint, which is a variety of the common green kind, is favoured in the districts where distilling is done, owing to the more powerful oil it yields. But black peppermint seems a tender plant on cold soils in the north, and it will perish during a hard winter unless it is covered in the autumn with two or three inches of fine mould, which must be removed as soon as congenial weather comes in spring. In any form peppermint is stimulant, antispasmodic, invaluable for flatulence and colic, and in daily use as a cordial and a carminative. It is impossible to say how much the old churchwardens and yeomen farmers were indebted to their nightcap of gin-and-peppermint.

Rosemary (*Rosmarinus officinalis*) flourishes in a rather dry soil, and is propagated by dibbling in side-slips during spring-time or in September. Rosemary is a nice-sounding, old-world name, which accounts for its occurrence in baptismal registers, being taken as a compound of Rose and Mary. Unfortunately for the assumption, this half-shrubby evergreen bears no flower of medicinal or decorative use; moreover, its generic and specific names mean 'sea-dew used in medicine.' We can find no good reason why Shakespeare and others should call it an emblem of remembrance and of faithful love, and why it should at any time have been specially selected to plant upon the grave of a beloved one. Still, like lavender, southernwood or lad's-love, and santolina—which usually grow side by side in herb-gardens for old acquaintance' sake—rosemary inevitably awakes all kinds of ancient memories. All these fragrant herbs may be put into pot-pourri for bowls, or into the linen-chest, or used anywhere for a safeguard against moths; and in winter-time they are sure to be reminiscent of the summer garden, 'sweet to the end with scents of yester-year.' We used to hear tell of the powdered leaves being preserved with sugar for a sweetmeat, and this, like home-made 'rosemary honey,' served as a flavouring for confectionery. For headaches the old folk had faith in its powdered leaves taken as snuff, usually in conjunction with a warm infusion called 'rosemary-tea.' Oil of rosemary is expressed from the green leaves, which may be scalded to apply as a household hair-wash with or without a block of camphor. Pour boiling water on the stalks and the green leaves, and let this decoction simmer near the fire for some hours, but not boil. Daily applications by gentle rubbing are serviceable when the hair falls out, and in some cases will promote a crop

of new hair. Rosemary-tea acts similarly as a good tonic, being stimulating to the nervous system, helpful to the circulation of the blood, and possessed of antispasmodic properties.

Rue (*Ruta graveolens*) was 'herb grace' before the days of Shakespeare's *Perdita*, but for a long time better known in the North Country by the insufferable corruption of 'yarby-grass.' An Aristotelian myth gives rue as a charm against witchcraft; later we are told that a leafy sprig was dropped into holy water used by priests at the asperges or sprinkling of the congregation at the commencement of a solemn service. Ophelia says, 'We may call it herb-grace o' Sundays.' Certainly rue is of neat, graceful growth, with small bluish-green leaves which last through the coldest winter. This foliage is standardised by botanists—hence the thalictrum, or false and hardy maidenhair fern, bears the common name of meadow-rue; while *Asplenium ruta-muraria* is the tiny wall-rue fern; and the favourite garden galegas, with the lilac-and-white flowers, are known as goat's-rue. 'Herb-grace' has failed to retain all the vogue it enjoyed for centuries as a medicinal herb, yet no herb-garden could pretend to be complete without it. It is easily propagated from slips or side-shoots, and may safely be relegated to the poorest bit of soil or the worst position. Rue will not suffer rash or hard cutting up to the time of high summer, but all the seed-vessels should be clipped off after flowering, as if these are allowed to mature the plant will suffer, probably die. The leaves may be taken either green or dried and powdered at the end of the summer, for making the bitter infusion called rue-tea—which has been disesteemed as 'acrid, pungent, nauseous, and with rank, ungrateful odour.' Still, there are rheumatically old folk who declare themselves benefited by a single leaf of rue dropped into their regular tea-pot while the brewing takes place. Rue is used for flatulence, for assisting the secretions, exciting the circulation of the blood, and giving relief to rheumatic sufferers. It is also sold for the cure of roup in poultry.

Tansy (*Tanacetum vulgare*) is the most disliked of medicinal herbs, although it certainly has handsome, curly, rich green leaves of strong

growth, much valued for garnishing and for decorative effects with flowers.' For the sake of this fern-like foliage and the flat-headed bunches of buttony yellow flowers, tansy has been introduced into a thousand gardens. The world will never see the end of tansy, or *tanisie* in the French, which is a corruption of the medieval Latin *Athanasia*, synonymous with a Greek word meaning 'not death'—hence 'immortality.' The yellow buttony flower-heads last a long time; the running root-stocks take such a firm hold of the ground that they are difficult to extirpate, and the longest frost does not injure them in the least. But what is to be done with tansy as a herb? Meat rubbed with a green leaf, so rich in essential oil, was considered quite safe from the blue-bottle fly in hot and sultry summer weather. Our forefathers had little to say against the vigorously aromatic and bitter flavour of tansy, which they used to flavour puddings, omelets, and cakes. Churchmen used it during Lent as a representative bitter herb, the leaves being always chopped very fine. Used with discretion and in moderation when savoury dishes are required, it is not likely to offend the palate. As a curative herb it is tonic and diaphoretic; good in cases of colic and excruciating gout; also an old-fashioned emmenagogue. Its chief virtue, however, is that of being a vermifuge for children.

Wormwood (*Artemisia absinthium*) is closely allied to southernwood and tarragon. It grows tall, and its stalks are clothed with beautiful indented foliage. Wormwood is quite easy to grow from seed, slips, or side-shoots, flourishing especially in a rather moist loam, and is cut after high summer for autumn drying. This herb has various uses apart from the French liqueur absinthe of ill-repute. We find it sold for ailing poultry, and the seed-stalks to place in chests and cupboards for repelling clothes-moths. The name suggests that it is anthelmintic and a vermifuge; that it will put a stop to the operations of wood-worms. Like horehound, it makes a good herbal beer. In cases of sore throat it should be used with new milk for poulticing, and a gargle should also be made of it, great relief being obtained in eight hours. Wormwood-tea is also an excellent bitter tonic.

THE PARTS MEN PLAY.

By ARTHUR BEVERLEY BAXTER, Author of *The Blower of Bubbles*, *Merrie Gentlemen*, &c.

CHAPTER XIII.—THE MAN OF SOLITUDE.

I.

IN a large room overlooking St James's Square a man sat writing. In the shaded light his face showed haggard, and his eyes gleamed with the brilliancy of one whose blood is lit with a fever.

The clocks had just struck nine when he paused in his work, and crossing to the French windows, which opened on a little terrace, looked out at the darkened square. The restless music of London's life played on his tired pulses. He heard the purring of limousines gliding into Pall Mall, and the vibrato of taxi-cabs whipped into

action by the piercing blast of club-porters' whistles. The noise of horses' hoofs on the pavement echoed among the roof-tops of the houses, and beneath those outstanding sounds was the quiet staccato of endless passing feet, losing itself in the murmur of the November wind as it searched among the dead leaves lying in the little park.

He had remained there only a few minutes, when, as though he had lost too much time already, the writer returned to the table and resumed his pen.

There was a knock at the door, and the writer looked up with a start. 'Come in,' he said; and a man-servant entered.

'Will you be wanting anything, Mr Selwyn?'

'No, Smith.'

'You haven't been out to dinner, sir.'

'I am not hungry.'

'Better let me make you a cup of tea with some toast, and perhaps boil an egg.'

'N—no thanks, Smith. Well, perhaps you might make some coffee, with a little buttered toast, and just leave them here.'

'Very good, sir.'

Although less than a year had elapsed since Austin Selwyn had first dined at Lady Durwent's home, experience, which is more cruel than time, had marked him as a decade of ordinary life could not have done. His mind had been subjected to a burning ordeal since summer, and his drawn features and shadowed eyes showed the signs of inward conflict.

As he had said of himself, all his previous experiences and education were but a novitiate in preparation for the great moment when truth challenged his consciousness and illuminated a path for him to follow. From an intellectual dilettante, a connoisseur of the many fruits which grace life's highway, he had become a single-purposed man aflame with burning idealism. From the sources of heredity the spirit of the Netherlands fighting against the yoke of Spain, and the instinct of revolt which lies in every Celtic breast, flowed and mingled with his own newly awakened passion for world-freedom.

He had left Roselawn with a formal good-bye taken of the whole family together. He had avoided the eyes of Elise, and she had made no attempt to alter the impersonal nature of the parting. Reaching London, he had been offered these rooms in St James's Square by an American, resident in London, whose business compelled him to go to New York for an indefinite period. As Selwyn felt the need for absolute aloofness, he had gladly accepted.

Hardly waiting to unpack his 'grips,' he at once began his battle of the written word, his crusade against the origin and the fruits of Ignorance as shown by the war.

Always a writer of sure technique and facile vocabulary, he let the intensity of his spirit focus on the subject. He knew that to make his voice

heard above the clamour of war his language must have the transcendent quality of inspiration. No composer searching for the *motif* of a great moving theme ever approached his instrument with deeper emotional artistry than Selwyn brought to bear on the language which was to ring out his message.

He felt that words were potential jewels which, when once the rays of his mind had played upon them, would be lit with the fire of magic. Words of destiny like blood-hued rubies; words fraught with ominous opal warning; words that glittered with the biting brilliance of diamonds—they were his to link together with thought: he was their master. The necromancy of language was his to conjure with.

Day after day, and into the long hours of the night, he wrote, destroying pages as he read them, refining, changing, rewriting, always striving for results which would show no signs of construction, but only breathe with life. When fatigue sounded its warnings he disregarded them, and spurred himself on with the thought of the thousands dying daily at the front. He saw no one. His former London acquaintances were engrossed in affairs of war, and made no attempt to seek him out. It was his custom to have breakfast and luncheon in his rooms; at dinner-time he would traverse the streets until he found some little-used restaurant, and then, selecting a deserted corner, would eat his meal alone. The walk there and back to his rooms was the only exercise he permitted himself, except occasionally, when, late at night, cramped fingers and bloodshot eyes would no longer obey the lashing of the will, and he would venture out for an hour's stroll through night-shrouded London.

Prowling about from square to square, through deserted alleys, and by slumbering parks, he would feel the cumulative destinies of the millions of sleeping souls bearing on his consciousness. Solitude in a metropolis, unlike that of the country, which merely lulls or tends to the purifying of thought, intensifies the moods of a man like strong liquor. He who lives alone among millions courts all the mad fancies that his brain is heir to. Insanity, perversion, incoherent idealism, fanaticism—these are the offspring of unnatural detachment from one's fellows, and in turn give birth to the black moods of revolt against each and every thing that is.

Living as he did in a sort of ecstasy by reason of his suddenly realised world-citizenship, Selwyn's incipient feeling of godlikeness developed still further under the spell of isolation. The fact that he trod the realm of thought, while all around him men and women grappled with the problems of war, only accentuated this condition of mind.

He suffered—that was true. He missed the companionship of kindred spirits, and sometimes his memory would play truant, recalling the pleasant glitter of sterling silver and conver-

sational paste which accompanied his former London dinner-parties. He did not dare to think of Elise at all. She was the intoxicating climax of his past life. She was the blending of his life's melodies into a brief, tender nocturne of love that his heart would never hear again.

In place of all that, he had the spiritual vanity of martyrdom. Few voyagers but have felt the exaltation of mid-ocean: that desire of the soul to leap the distance to the skies and claim its kinship to the stars. It comes to men on the Canadian prairies; it throbs in one's blood when the summit of a mountain is reached; it is borne on the wings of the twilight harmonies in a lonely forest.

Unknown to himself, perhaps, that was Selwyn's compensation. From his hermit's seclusion in the great metropolis he felt the thrill of one who challenges the gods.

II.

His man-servant had hardly left the room when the bell in the front hall rang, and Smith reappeared to announce a visitor.

'Who is it?' asked Selwyn.

'A Mr Watson, sir.'

'I wonder if it can be Doug Watson of Cambridge. Bring him right up.'

A moment later a young man entered the cosily shaded room, and they met with the hearty hand-clasp and the sincere good-feeling which come when a man who is abroad meets a friend who is a fellow-countryman. The new-comer was younger than Selwyn, and though of lighter complexion and hair, was unmistakably American in appearance. Like the author, he was clean-shaven, but there was more repose in the features. His face was broad, and in the poise of his head and thick neck there was the clear impression of great physical and mental driving-power. Although still a student, the mark of the engineer was strongly stamped on him. He was of the type that spans a great river with a bridge; that glories in the overcoming of obstacles by sheer domination of will.

'Well, Doug,' said Selwyn as they drew their chairs up to the fire, 'when did you leave Cambridge?'

'Last week,' said the other. 'I couldn't stand it any longer with every one gone. I don't think that one of the bunch I played around with is there now.'

'That was a bully week-end I had with you at the university.'

'We sure had a good time, didn't we?'

'But how did you know I was here?'

'Jarvis sent me a note that he and his wife were running back to New York, and that you were taking his rooms. Damn fine place, isn't it? There's a woman's touch all over here. But you're looking precious seedy.'

'I feel all right.'

'You don't look it.'

'I have been very busy, Doug.'

'Glad to hear it. Putting over a killing in the literature game?'

'The biggest thing yet,' said Selwyn, opening a chest of drawers and searching for the cigars. 'I am making a sincere attempt to write something which will sway people. Have one of these?'

'Thanks. I guess I'd better smoke one while I have the chance. It might get the sergeant-major's goat if he found a buck private smoking half-crown cigars.'

'You haven't joined the army?'

'Not yet; but I shall to-morrow. You can do it by graft, old boy. For three weeks I've courted a colonel's daughter so as to get next to the old man, and to-morrow I receive my reward. I am to become a full-fledged Tommy Atkins.'

'And the daughter?'

The younger man grinned and cut off the end of his cigar with a pocket-knife. 'Can you see the colonel's daughter "walking out" with a Tommy? My dear Austin, patriotism excuses much, but the social code must be maintained. I'd render that in Latin if I wasn't so rusty on languages. How are chances of your coming along with me to-morrow?'

Selwyn reached for an ash-tray and matches. 'America is neutral,' he said quietly.

'America is not neutral,' replied Watson with a decisiveness that one would hardly have suspected to lie beneath the calm exterior and the veneer of good-breeding polished by Cambridge associations—a veneer that made his occasional lapses into crudity of language seem oddly out of place. 'The German-Americans, the Irish-Americans, the Jewish-Americans, the God-knows-who-else-Americans may be neutral, but the America of Washington and Lincoln, the America of Lee and Grant, isn't neutral. Not by a long sight.'

'Doug,' said Selwyn reproachfully, 'you are the last man I thought would be caught by this flag-waving, drum-beating stuff.'

The younger man's brows puckered as he looked through the haze of tobacco-smoke at his host. 'Austin,' he said abruptly, 'you've changed.'

'Yes,' said Selwyn thoughtfully. He was going to say more, but, changing his mind, remained silent.

'I thought you looked different,' went on Watson. 'What's up?'

Selwyn's eyes narrowed and his lips and jaw stiffened resolutely. 'I am writing,' he said, enunciating each word distinctly, 'in the hope of arousing the slumbering conscience of the world against this war.'

'Canute the Second,' commented Watson dryly.

'Doug,' said the other, frowning, 'I deserve better than sarcasm from you.'

'I'm sorry,' said Watson with a laugh, 'but I can't just get this new Austin Selwyn right

off the bat. Of course war is wrong—any boob knows that—but what can you hope to do with writing about it?’

Selwyn rose to his feet, and thrusting his hands in his pockets, strode up and down the room. ‘What can I hope to do?’ he said. ‘Remove the scales from the eyes of the blind; recall to life the spirit of universal brotherhood; destroy ignorance instead of destroying life.’

‘Some platform!’ said Watson, making rings of tobacco-smoke.

‘Take yourself, for example,’ said Selwyn vehemently, pausing in his walk and pointing towards the younger man. ‘You are a man of international experience and university education. On the surface you have the attributes of a man of thought. You are one who the world has a right to expect will take the correct stand on great human questions. Yet the moment the barriers are down and jingoism floods the earth you give up without a struggle and join the great mass of the world’s drift-wood.’

‘H’m,’ mused Watson, ‘so that’s your tack, eh?’

‘I tell you, Doug, you have no right to fight in this war.’

‘Thanks.’

‘You should have the courage to keep out of it. Even assuming that Germany is wholly in the wrong and Britain completely in the right, can’t you see that when the Kaiser and his advisers said, “Let there be war,” you and I and the millions of men in every country who believe in justice and Christianity should have risen up and answered, “*You shall not have war*”?’

Watson rose to his feet, and crossing to the fireplace, flicked the ash from his cigar, and leaned lazily against the stone shelf. ‘You’re a member of the Royal Automobile Club, aren’t you?’ he drawled.

Selwyn nodded and resumed his nervous walk.

‘Take my advice, Austin. Every time you feel that kind of dope mounting to your head, trot across the road to the club and have a swim in their tank. You’d be surprised how it would bring you down to earth.’

‘You talk like a child,’ said Selwyn angrily.

‘Well,’ retorted the other, ‘that’s better than talking like an old woman.’

With an impatient movement of his shoulders the younger man left the fireplace, and walking over to the piano, picked up a Hawaiian ukulele which had been left there by Mrs Jarvis. Getting the pitch from the piano, while Selwyn continued his restless march up and down the room, he studiously occupied himself with tuning the instrument, then strummed a few chords with his fingers.

‘Sorry not to fit in with your peace-brother-peace stuff,’ said Watson amiably, strumming a recent rag-time melody with a certain amount of

dexterity, ‘but I always played you for a real white man at college.’

‘Doug,’ said Selwyn, stopping his walk and sitting on the arm of a big easy-chair, ‘if there is a coward in this room, it’s you.’

The haunting music of the ukulele was the only response.

‘Here you are at Cambridge—an American,’ went on Selwyn. ‘Just because the set you know enlists with an accompaniment of tub-thumping’—

‘That isn’t the way the English do things,’ said Watson without pausing in his playing.

‘My dear fellow,’ said Selwyn, ‘don’t let the pose of modesty fool you over here. They profess to hold up their hands in horror when we get hold of megaphones and roar about “The Star-Spangled Banner,” but what of the phrases, “The Empire on which the sun never sets,” “What we have we’ll hold,” “Mistress of the seas”? Is there so much difference between the Kaiser’s “*Ich und Gott*” and the Englishman’s “God of our far-flung battle-line”? Jingoism! We’re amateurs in America compared with the British—and you’re caught by it all.’

‘Nothing of the sort,’ said Watson, putting down the ukulele. ‘All I know is that Germany runs amuck and gives a mighty good imitation of hell let loose. I am not discounting the wonderful bravery of France and Belgium, but you know that the hope of everything lies right in this country here. Well, that’s good enough for me. I’m a hundred per cent. American, but right now I’m willing to throw over my citizenship in the United States and join this Empire that’s got the guts to go to war.’

‘Listen, Doug,’ said Selwyn, moving over to the younger man and placing his hands on his shoulders; ‘can’t you see that Germany is not the menace? She is only a symptom of it. War, not Germany, is the real enemy. I admire your pluck: my regret is that you are so blind. The whole world is turning murder loose; it is prostituting Christian civilisation to the war lust—and you imagine that by slaughter Right may prevail. The tragic fallacy of the ages has been that men, instead of destroying evil, have destroyed each other. If every criminal in the world were executed, would crime end? Then—do you think the annihilation of this or that army will abolish war?’

‘I haven’t your gift of plausible argument,’ said Watson, ‘and I suppose that theoretically you are sound in everything you say. Yet, instinctively, I know that I am doing the right thing.’

‘A woman’s reasoning, Doug,’ Selwyn relit his cigar, which had gone out. ‘For a few days after the outbreak of war I will admit that I doubted, myself, and wondered if, after all, there was a universal heart-beat. Then came the news of the silent march of those thousands of women down Fifth Avenue,

marching to the beat of muffled drums as a protest against war—not against Germany—higher than that. It was a symbol that the cry of Rachel for her children still rings through the centuries. It was the heart of America's women calling to the mothers of France, Germany, and Britain against this butchery of their sons.'

Selwyn sank into a chair, and a look of weariness succeeded the momentary flush of excitement.

'That ended my last doubt,' he went on quietly. 'I knew then that if I could summon the necessary language to express the vision I saw, my message would sound clear above the guns. I completed three articles—"A Fool There Was," "When Hell Laughed," and "Gods of Jingoism." I gave them to my London agent, but you would have thought they held germs of disease. He brought them back to me, and said that no one would dare to publish them in England. In other words, the English couldn't stand the truth. I sent them on to New York. This is my agent's reply.'

He took a letter from a file on the table and handed it to his guest. 'Read it,' he said.

With an inscrutable smile the Cambridge-American looked at the paper and read:

'NEW YORK, 10th October 1914.

'DEAR MR SELWYN,—You will be pleased to know that I have succeeded in placing your articles "When Hell Laughed," "A Fool There Was," and "Gods of Jingoism" with a prominent newspaper syndicate. The price paid was \$800 each, and I herewith remit my cheque for \$2160, having deducted the usual commission. I have every reason to believe that any further articles you send will meet with a ready market, especially if they follow along the same lines of exposing the utter futility of war. As a matter of fact, this syndicate is prepared to pay even a higher price if these articles, which will be published all over the United States, meet with the approval they confidently expect.

'Assuring you of my desire to be of service to you, I remain, yours very sincerely,

'S. T. LYONS.'

'Very nice, too,' murmured Watson at the conclusion of the letter. 'Who says that high ideals don't pay?'

'What do you mean?' said Selwyn sternly.

The younger man got up from his chair and looked at his watch. 'Don't get shirty,' he said. 'I was only thinking that 800 per is a fairly healthy figure for that dope.'

'I don't give a damn for the money,' said Selwyn hotly, 'except that it shows there is a demand in America for the truth. Britain has always been afraid to face facts—thank God, America isn't.'

'Well,' said Watson with a slight yawn, 'it's quite obvious that we're as far apart as the poles on that question, so I think I'll cut along.'

'Stay and have a cup of coffee. There's some being made; it will be here in a minute.'

'No, thanks. To be brutally frank, Austin, the ozone around here is a little too rarefied for me. I'm going out to a cab-stand somewhere to have a sandwich and a cup of tea with any Cockney who hasn't joined the Citizenship of the World.'

With the shadows under his eyes more pronounced than before, but with the unchanging look of determination, Selwyn helped the younger man on with his coat, and handed him his hat and stick. 'I am sorry you won't stay,' he said calmly, 'for your abuse and sarcasm are nothing to me. When I took this step I foresaw the consequences, and, believe me, I have suffered so much already that the loss of another friend means very little.'

The powerfully built young American twirled his hat uncomfortably between his fingers. 'Look here, Austin,' he said vehemently, 'why in blazes can't you get all that hot air out of your system? Come on—meet me to-morrow, and we'll join up together. It'll be all kinds of experience, you'll get wagon-loads of copy, and when it's all over you'll feel like a man instead of a sissy.'

With a tired, patient smile Selwyn put out his hand. 'Good-night, Doug,' he said. 'I hope you come through all right.'

When he heard the door close downstairs as Watson went out, Selwyn re-entered the room. The light of the electric lamp glaring on his manuscript pained his eyes, and he turned it out, leaving the room in the dim light of the fire. The man-servant entered with a tray.

'Will you have the light on, sir?'

'No, thanks, Smith. Just leave the things on the table.'

'Thank you, sir. Good-night, sir.'

'Good-night, Smith.'

The room was strangely, awesomely quiet. There was no sound from the deserted square; only the windows shook a little in the breeze. He reached for the ukulele, and staring dreamily into the fire, picked softly at the strings until he found four notes that blended harmoniously.

The fire slowly faded from his gaze, and in its place, by memory's alchemy, came the vision of *her* face—a changing vision, one moment mocking as when he first met her, turning to a look of pain as when she spoke of Dick, and then resolving into the wistful tenderness that had crept into her eyes that evening by the trout-stream—a tenderness that vanished before the expression of scorn she had shown that fateful August night.

The night stole wearily on, but still Selwyn sat in the shadowy darkness, occasionally strumming the one chord on the strings, like a worshipper keeping vigil at some heathen shrine and offering the incense of soft music.

(Continued on page 293.)

MODERN USES OF NICKEL AND COBALT.

NICKEL is known to most people chiefly as the outer coating of nickel-plated ware, and as a component of the alloys which are used for coinage in certain countries. Lately we may have heard, perhaps without quite understanding what is meant, that finely divided metallic nickel is used as a 'catalyst,' or a carrier of hydrogen in the hydrogenation or hardening of oils for use in the manufacture of margarine. But nickel has a far more important use as an ingredient of nickel-steel, which is one of the strongest and most ductile types of steel manufactured. Nickel-steel contains about $3\frac{1}{2}$ per cent. of nickel, and is used in the manufacture of armour-plate, ordnance, projectiles, and gun-shields, as well as for motor-car parts, its employment for the last-named purpose being on a rapidly expanding scale.

For bridge-building, the qualities of toughness and strength which nickel-steel possesses are particularly valuable, and it has been employed in the construction of the Manhattan and Queensborough bridges in New York City, in the St Louis municipal bridge over the Mississippi, in the Kansas City viaduct and bridge over the Missouri, in the emergency dam, locks, and spillways in the Panama Canal, and in the reconstruction of the Quebec bridge over the St Lawrence River.

Monel metal, consisting of about two-thirds nickel, 28 per cent. copper, and about 5 per cent. of impurities, including manganese and iron, is used for propeller-blades, valves, tie-rods, shafting, and pump-rods. Bullet-casings contain 15 to 20 per cent. of nickel, which is added to give a surface which will not be destroyed by the rifling of the barrel. Alloys used for nickel coins usually contain about three parts copper and one part nickel. 'Nickel-silver' alloys consist of nickel alloyed with copper and zinc, and are used for table-ware, railway-car fittings, &c.

One point about nickel which is of special interest to all British people is that over 80 per cent. of the world's production of this metal is mined in the British Empire—namely, in Ontario. Though nickel is found and produced in small quantities in many places, there is only one other important producing country, the French island colony of New Caledonia, in the Pacific Ocean. Included in the proposals that have been made for the adoption of a decimal coinage in the United Kingdom is one for the use of certain nickel coins. The resort to nickel in our coinage would utilise an Empire product in place of a certain amount of copper, a large proportion of which we get at present from the United States.

For many years the nickel-copper ores mined at Sudbury, in Ontario, where the most extensive nickel-ore deposits in the world are situated, were smelted to a crude matte containing about 80

per cent. of the combined metals, nickel and copper, and sent to the United States (New Jersey) and to Wales (Clydach) for refining. Naturally a desire soon arose among Canadians for the establishment of a nickel-refining industry in the Dominion, and an agitation in favour of this has been going on for years. In 1915 a Commission was appointed by the Government of Ontario to inquire into the resources, industries, and capacities of the province in connection with nickel and its ores. For a quarter of a century two questions have been uppermost in the numerous discussions that have taken place concerning Ontario's nickel industry: (1) Can nickel be refined economically in Ontario? (2) Are the nickel-deposits of Ontario of such a character that the province can compete successfully as a nickel-producer with any other country? Both these questions the Commissioners answered in the affirmative. They found that the nickel-ore deposits of Ontario are much more extensive, and offer better facilities for the production of nickel at a low cost, than those of any other country; and that the most satisfactory method of refining in Ontario will be the electrolytic, because (1) electric-power is cheap and abundant; and (2), practically no chemicals being required, there is an almost complete saving of the precious metals found in association with the nickel, especially platinum and palladium.

As a result of the work of the Ontario Nickel Commission, nickel-refining may now be regarded as established in Canada, and there is reason to hope that it will develop until the whole of the nickel produced in the Dominion is also refined there. The International Nickel Company of Canada, Limited, a subsidiary of the International Nickel Company, which is American, has erected a refinery at Port Colborne, on Lake Erie, which commenced operations in July 1918. The British-America Nickel Corporation has been started with assistance from the British Government, and is exclusively British. It has been steadily at work developing the Murray Mine, a very extensive deposit, and constructing a smelter and a refinery. The latter is being erected at Hull, on the Quebec side of the Ottawa River, from which power will be obtained. It will have a producing capacity of six thousand tons of refined nickel yearly.

Another point of interest in connection with the refining of nickel in the Dominion is that the precious metals, platinum, palladium, iridium, and other rare metals of the platinum group, which are contained in the ore in minute quantities, will be recovered in Canada and credited to the Dominion. The smelting process concentrates these rare metals in the matte, which, as we have seen, was formerly shipped for refining to the United States, where the precious

metals were separated. Their recovery is a difficult task, but the great value of the metals justifies every effort being made to ensure this end. Palladium, which has long been used in dentistry, and is now replacing platinum both in dental work and in jewellery, is found in the largest quantity, and is followed by platinum, iridium, and rhodium in the order named. By either the Mond or the electrolytic process of nickel-refining it is possible to save practically the whole of the precious metals, and both methods actually recover a large proportion in the form of a by-product which is sold on the basis of its content of precious metals. The matte smelted from the ores obtained from the Vermilion Mine is unusually rich in platinum, and is treated in a separate operation, so that the precious contents may be recovered.

An account of nickel should not omit some mention of cobalt, which is associated with nickel in the minds of all who have studied elementary chemistry. One of the chief localities where this metal is obtained is the district named Cobalt, in Ontario. The silver-cobalt ores in this district produce about 15 per cent. of the world's output of silver. The world's consumption of cobalt at present is not great, but it is capable of considerable expansion. The compounds of cobalt, especially the pigments, smalt, cobalt blue, &c., were for centuries the only forms in which cobalt was used. But the metal itself is now of growing importance. Experiment has shown that, in electroplating, a solution

of cobalt is deposited fifteen times faster than nickel, that the cobalt deposited at this speed is much harder than the nickel deposited in any commercial nickel bath, and that consequently a less weight of this hard cobalt deposit will offer the same protective coat as a greater weight of the softer nickel deposit. Cobalt-plate takes a high and brilliant polish which possesses a slightly bluish tinge. It is believed that as a result of these discoveries there will soon be a large demand for cobalt for electroplating.

Steel containing about 4 per cent. of cobalt, in addition to tungsten and chromium, is used for making high-speed machine-tools which retain their cutting-edge at or near a red heat. Nickel-steel tools, on the contrary, soften at the edge when hot. An alloy of cobalt and chromium with tungsten takes a cutting-edge equal to the best steel, and can be used for table-knives, pocket-knives, surgical and dental instruments, spoons, forks, and scissors. But the special value of this alloy lies in its resistance to oxidation and to the action of organic acids. The alloys thus formed possess the property of preserving a cutting-edge at high temperatures, and this quality and their extreme hardness render them, it is claimed, superior to all high-speed steels. They are known as 'stellite' alloys, and are suitable for lathe-tools, boring-tools, drills, and saws. Table-knives made of stellite alloy have remained brilliant and untarnished after six years' use, whilst retaining a good cutting-edge.

SHARK-BAITING AT PANAMA.

By Captain MONAHAN.

I.

H.M.S. BLARNEY CASTLE lay in the offing of the most wonderful canal ever built by man. Yet, instead of dilating upon the colossal ingenuity that was to enable their cruiser to burst through Central America into the Pacific, the officers were engaged in planning a shark-catch!

The idea of the thing originated during the 'dog-watches,' that brooding period after tea when all sorts of schemes are hatched in the navy. On this occasion something really had to be done; everybody felt so incensed at leave not being granted to go ashore at Colon. This seemed most unreasonable, because, owing to certain parleys with the Panama Canal officials, the cruiser could not possibly 'go through' before morning—and there was to be a dance at the George Washington Hotel that same night.

At first nothing more exciting than a 'dip' was contemplated. The officer of the watch accordingly made a signal to one of the other men-o'-war inside the breakwater. 'Do you

permit your people to bathe here?' he inquired. The answer came back quickly enough: 'No; we content ourselves with the canvas-bath—that and catching sharks.'

The suggestion was quite enough for the surgeon-lieutenant, who had never seen a shark landed, and was madly anxious to try his luck. 'What about it?' he asked the officer of the watch in his usual impetuous manner.

'Better see the commander first,' advised the latter officer, who was standing by the starboard gangway, telescope under his arm. In other ways too he looked a proper sailor, with azure-blue eyes, and bow-legs that made him cant the soles of his purser's crabs.

The commander was down in the wardroom, in none too good a humour either. Understanding the messman to have come off from Colon with plenty of oysters, he had promptly ordered a dozen of them, with, of course, the traditional bottle of stout. In place of the eagerly-longed-for 'pearly whites' on a glistening background of natural camouflage, the marine waiter had put before him a dish of the most revolting-

looking oysters ever set down before man. Torn asunder from their external skeletons, the poor, creamy, crumpled-up invertebrates lay huddled together on the plate, as if in shrinking anticipation of their acrid enemy, tabasco sauce, being dropped on them at any moment. 'Where's the messman?' the commander angrily demanded, thinking the fault must be in the serving.

The messman appeared, and urbanely explained that, inasmuch as the oysters came out of a Yankee tin, it was impossible to oblige the commander with shells, much as he would like to do so.

Then the surgeon-lieutenant appeared. 'May we catch sharks, sir?' he breathlessly inquired.

Contrary to the expectations of onlookers, the commander did not jump down the young doctor's throat. The poignancy of his oyster grief vanished immediately, and his decorated breast became filled with hope. Not so many weeks ago he had rashly promised some shark's teeth to a ripping girl at the Grafton Galleries dance. At the time he did not have the least idea how the thing was to be done, seeing the *Blarney Castle's* job then consisted in convoying between Plymouth and Halifax. Now there rose in the commander's mind a picture of his triumphant entry into her Cadogan Gardens home. No wonder he surprised the ward-room by answering the doctor's query in the service affirmative, 'Yes, please;' adding, 'But remember the teeth belong to me, and let me know when you get a bite.'

II.

Catching sharks in tropical waters may sound easy, but it is more difficult than one is apt to suppose. To begin with, the chief boatswain had to be asked for the shark-hook which every one of His Majesty's ships carries in order to provide amusement for the ship's company when occasion offers. The warrant-officer in question handed it over in a grudging sort of way, as if former experiences warned him trouble was brewing. He had been in the *Blarney Castle* last commission, and was possibly thinking of what occurred off Chesapeake Bay. Almost an entire school of sharks had been nipped within an hour; and there had been the very devil to pay all over the ship.

What to bait the hook with? A remarkable degree of unanimity prevailed on this point. Every one seemed to regard the voracious monster as being swinishly inclined. As the engineer-lieutenant said, 'A shark goes mad at the mere prospect of a meal of pork; and whenever he finds himself next to a lump of it, he simply can't do anything else except turn over on his ugly back, and gulp it down at all costs.'

Pork being agreed upon as the ideal dietetic inducement, the next thing was to approach the paymaster-lieutenant-commander, as being responsible for all victualling stores. As usual,

that officer was very, very busy. However, on being promised a lime cocktail, he gave his consent, providing it was convenient for the ship's steward to open a cask of the salty stuff. In due course that worthy signified his pleasure at being able to oblige the surgeon-lieutenant ('That means at least a bottle of beer,' the latter reflected), and would he let him know at once the number of pounds required?

This started another frantic 'cag.' One officer made everybody quail by claiming it would take at least fifty pounds to bait for the ordinary man-eating shark. However, upon the captain of marines relating the experience of the Royal Corps in the Indian Ocean, which had been singularly successful on a four-pound basis, it was decided to ask the ship's steward to supply this modicum for a start. The square piece of pork soon appeared on deck. The doctor had a great antipathy toward this form of meat, so his friend, the engineer-lieutenant, graciously consented to affix it to the shark-hook.

The next thing to settle was what kind of a line to use. Hemp, of course, was most convenient; but somebody said if the shark swallowed the hook he would be quite capable of biting through any hemp rope attached to its swivel. The chief bos'un was again consulted. Apparently this officer had developed a deep-rooted dislike toward any one wishing to nip a shark. Such a stodgy pastime did not fit in with his conception of enjoyment, which happened to be amateur theatricals. It did not occur to him that his beery and pantomimic performances of a few days before (Christmas Day) had been a nuisance to everybody on board. That was his method of amusing himself. He could not make allowance for shark-hunting being somebody else's. It may be that the heat, which was terrific in the warrant-officers' Mess, had affected him. At any rate, he was very rude to the young doctor. 'Do you want me to catch the blinking shark for you?' he roared, taking up a signal-pad and writing something on it. 'There,' he said, 'is an order for twenty fathoms of two-and-a-half-inch hemp-line. You can take it or lump it, as you please. It's the best I can do for you.'

Even when the shark-hook (with its piece of beautifully pink salt pork) was connected up with the line the bos'un had so unwillingly furnished, there was something further to be determined. What sort of shark lurked in the vicinity—ground or otherwise? The chief gunner opined in favour of ground-sharks, declaring the hook ought almost to touch the bottom. Other officers disagreed with him, and scoffed at the ground-shark theory. The great bulk of the shark, these authorities contended, requires several feet of water to float it comfortably, and he is not the kind of fellow who stints himself with no other object in view than scratching his belly on the bottom of the sea.

In order to meet these divergent views, the pacific engineer-lieutenant suggested the happy medium of suspending eight feet or so of the baited line from a floating spar. This was finally done, enough of the rope being paid out to keep the white spar well clear of the stern-end of the ship.

III.

It may be thought that, after all the trouble they had taken, the officers would have watched that line like a cat watching a mouse. Circumstances, however, were against their devoting any more time to it. In the first place, shore leave being granted after all, it was as much as they could do to dress in time to catch the 6.45 P.M. boat. Even on returning they were in a far too exalted state, discussing the various girls they had met and danced with at the George Washington Hotel, to descend to the level of such a debased sport. At least, when the possibility of a 'catch' was mentioned by the Sindbad-looking officer before referred to, he was badly 'sat upon' by the 'pilot.' 'There's a time and a place for everything, Strongbow,' the navigating officer sententiously rejoined, 'but after the gloriously artistic evening we've all had'—here the pilot struck his breast ecstatically—'the very idea of such loathsome creatures being within ten thousand miles of yon lovely womanhood'—pointing to the brilliant glare of lights on the Colon front—'is enough to banish sleep from my dazzled eyes for ever and ever, amen;' at which every one hurrahed sleepily, because the pilot was capable of snatching more 'forty winks' a day than anybody else in the Mess.

Nobody lost any time after that in 'getting his head down,' as sleeping is gracefully spoken of in the service. The young doctor and the engineer-lieutenant slept on the quarter-deck, from which—even in the tropical darkness—the tell-tale spar could be discerned bobbing up and down merrily in the swirl of the incoming tide. As if to enable their masters to keep an eye on the unstable mark, the servants of these two officers had placed their stretcher-like couches near where the still loose line trailed over the stern-end of the *Blarney Castle*.

The temptation was too much for the captain of marines. That jolly 'soldier' had missed the last boat, and only came off to the ship about 2 A.M. in a police launch. It seemed to the marine (in his hilarious condition) that those couches ought to be connected up with the shark-line, else (hic) how would the officers know when they had a bite? Thinking meant doing with the soldier at that refreshing hour of the morning, and the thing was done in a jiffy.

A young Scottish 'sub' named M'Crie was still keeping that most detested of all vigils, the middle watch, when the quartermaster reported the 'two officers' as 'making 'orrid noises and cuffing each other at the *hafter* end of the quarter-deck.' It may be explained that night-

mare was never more common in the navy than at present, after the strenuous sea exertions of the last few years. In this instance there was some excuse for the doctor and the engineer-lieutenant getting into a sort of somnambulistic panic. Their respective couches had been suddenly and fearfully dragged from beneath them; and the best of unwakened friends coming into rude contact with each other, they had engaged in a pommelling-bout. Now, after being separated by M'Crie and the quartermaster, they were regarding one another rather sheepishly. No time could be wasted on explanations, however, if the couches were to be saved. They were already dangling half-way over the captain's stern walk, and some powerful force still tugged at them violently. 'A shark!' the quartermaster cried, taking a riskful leap over the railing and using his jack-knife to such good effect that the officers' beds were pulled back out of harm's way.

Next came the task of getting the quarry on board. Block and tackle had to be used to drag the brute along the ship's side as far forward as the port-battery. Of course, the shark kept lashing up the sea in his fury to break away; and the crescendo of the awful struggle was reached when his nose was got out of water, and he felt the lack of the oxygen his gills were no longer in a position to extract from the sea. It was at this juncture that it became possible to engirdle him firmly with a stout noose passed down the line which had nipped him. After that it did not take long to hoist him inboard, and put him out of misery with a few revolver-shots.

After breakfast the surgeon-lieutenant could scarcely force his way through the dense cordon of curious men on the battery-deck. 'Hostility' ratings formed a goodly sprinkling of the ship's company, and most of them had never seen a shark before. What a ghastly sight it presented in the morning sunlight! The enormous jaws had been prised widely open with a block of wood, showing the slimy, capacious mouth, as well as giving a view of the inner aspect of the horrid-looking gills. These latter had several tubes of white flesh running across them, like so many reeds of a pipe-organ. There being neither wind-pipe nor lungs, the throat was nothing but a highly distensible tube leading down to the enormous belly, where the baited hook had penetrated deeply. Although the dead thing (which had very small eyes) measured 9 feet 6 inches, a glance at the teeth showed it to be only about half-grown. It had only two rows of teeth; and the teeth themselves were not nearly so formidable in appearance as one had been led to expect. Apart from the prominent fin surmounting the rough, suede-tinted back (and enabling the species to be readily distinguished from the dog-fish), the shark had a peculiar spear-like attachment on the end of his tail. This is nearly always taken advantage of in consummating the capture. At the critical

moment a running haul-bowline is slipped over this useful appendage, and drawn taut so that he is prevented from cutting any further capers.

IV.

Getting the shark aboard was an easy enough matter. Effecting a riddance of him turned out to be an affair of an altogether different calibre. By this time the *Blarney Castle* had entered the Panama Canal, where it is strictly forbidden to heave anything overboard. This meant, of course, the carcass could not be disposed of until the cruiser had penetrated to the Pacific, sometime during the afternoon. Apart from its malodour (resented by everybody except the surgeons, who sniffed it with affected relish, and said it reminded them of the good old days of the dissecting-room), there were several reasons why the continued presence of the shark's body was anything but a happy omen on board. The bos'un, for instance, felt extremely dissatisfied because the wretched thing went on soiling his deck. Then the matter affected him from the point of view of stores. He was custodian of the shark-hook; and in hoisting the hated fish into an erect posture for photographic purposes, the strain had proved too much for the hook (which the bos'un swore ought never to have been employed for such an object), with the result that it snapped in two. This happened when the *Blarney Castle* was rising rapidly in the famous Gatun Lock; and the American girls looking down on them from the canal-bank shrieked with laughter at the sight of the ungainly mass flopping to the deck with a half-ton crash. Such a *contretemps* could not but upset the commander's somewhat acute sense of the fitness of things in general and ladies' opinions in particular. It was not by any manner of means the only untoward incident of the past twelve hours. To go back to the early morning: the officer of the watch had failed to call the commander when the shark was found to be on the line; and the senior officer in question had been extremely desirous of seeing it come aboard. Then, as if to add insult to injury, during the forenoon the ship's company had made surreptitious but free use of the blacksmith's pincers, so that there was not a tooth left for anybody; and he had promised that Cadogan Gardens girl a set of them!

Nor was the young doctor in any too jubilant a frame of mind. The engineer-commander had tickled his professional vanity by intimating he would like a scientific demonstration of what a shark's interior looked like. The surgeon-lieutenant immediately sent for'ard to the sick-quarters for his surgical-apron, operating-gloves, and amputating-knife. The sun was very hot, the stench in the vicinity overpowering. The engineer-commander fainted shortly after the doctor had made his preliminary incision. Unhappily the captain came along at this in-

opportune moment, and censured the medical officer for behaving in such a tactless manner. At the same time the skipper prohibited any further meddling with the carcass until the Pacific was in sight, so that it could be thrown overboard immediately afterwards. 'My own personal opinion is that the carving had better be left to the ship's butcher,' the captain added ironically. All the surgeon-lieutenant could do under the circumstances was to have word passed on to the butcher to be sure and give him a call when he started the hacking. This request was not prompted by idle curiosity on the medical officer's part. He had set his heart on getting out the backbone intact, this part of the shark's anatomy being much sought after as a walking-cane.

The surgeon-lieutenant overlooked the torpifying effects of a tropical afternoon; and the bottle of stout he had had for lunch did not help matters. By the time he had come out of the usual naval 'caulk' (and the butcher's mate asserted he was told to 'go away' when he had attempted to rouse him), the *Blarney Castle* was well out on the Pacific, and the filleted remains had been derisively cast into the sea, much to the relief of everybody's olfactory organs.

'The next shark we catch will be a private concern,' the doctor remarked to the engineer-lieutenant at tea, after bewailing the loss of his walking-cane; 'and perhaps some one else will have a chance of going in the ditch,' he added, looking hard at the soldier, who had somewhat facetiously declared his intention of sleeping on deck, now that they were out of the shark zone!

THE WITCH.

MUMBLING, mysterious, mordant-mooded,
March comes in by the woodland way,
Clad like an old witch, cloaked and hooded,
Drenched with December, dreaming May.

Shades of the long night still enfold her,
Still is her robe slashed gray with sleet;
Drift of the snow still damps her shoulder,
Splash of the mire still flecks her feet.

Gloomy she tramps through the woodland alleys,
Wan with the woe of the leafless trees. . . .
Hark! A song from the waking valleys
Parts the cloak on the witch's knees!

Lifts the hood from her green-clad shoulder,
Lights the fire in her wondrous eyes!
March grows young as the year grows older,
Spring is born as the winter dies.

Willowy wand in her hand displaces
Broom of the wind. She's a laughing maid,
Charming the flowers to the open spaces,
Calling the birds to bower and glade.

Out in the dew that the dawn discovers
Watch for the witch on her woodland way!
Look in her eyes and be glad, ye lovers!
Under her hood are the dreams of May!

SEVENTH SERIES

HABITS AND CHARACTERS OF BRITISH WILD ANIMALS.

I.—THE BADGER.

By H. MORTIMER BATTEN.

I.

THOUGH now scarce or utterly exterminated in many districts where once it was abundant, the badger can hardly be set down as a rare animal. In parts where it still exists in comparatively large numbers its presence is unknown except to a few local followers of woodcraft, for the badger is so much of a recluse, so strictly nocturnal in its activities, and, above all, so cautious in secreting its runways where one would least expect to find them, that the naturalist must first know something about Brock's habits in order to locate him.

Coniferous forests are the badger's chief abode in the British Isles, and it is particularly partial to pine-woods generously surrounded by cover. This is probably because pines grow as a rule on water-washed hillsides and ridges where the ground is of sandy formation, which suits Brock's subterranean architecture. Fir-forests, where the undergrowth is rank with bracken and bramble, similarly meet his tastes, and in certain parts of the New Forest, particularly the vicinity of Boldrewood, badgers are as numerous to-day as ever before. In fact, provided one is acquainted with the district, I know of no better country than the New Forest for studying the badger at home.

Amidst the game-preserves of Northamptonshire the badger still holds out in many localities, and considerable warrens are to be found if one knows where to look. In parts of Wales it is common; in fact, Wales may be set down as its true home, so far as Britain is concerned, and the keen and plucky terriers used for badger-hunting are bred chiefly in the Principality. In most parts of Scotland the badger is now rare, though occasional families are to be found in remote Highland localities.

Judging from its markings, one would conclude that the badger is truly a beast of the night. In daylight it is conspicuous, the markings of the face seeming to catch and hold the light; but when at night-time Brock moves along the silver patches of moonlight and the ebony, shifting shadows, he himself is a shifting shadow of ebony and silver—so wonderfully camouflaged

that the keenest night-watcher must keep very wide awake indeed if he is to see anything at all.

I know of one warren situated in the heart of a small, dense pine-forest, surrounded by open fields. In passing to and from this forest during their nocturnal pilgrimages the badgers prefer always to follow the course of a hedgerow rather than venture into the open moonlight. They will even make a detour of two or three fields to avoid passing an open gateway, and in this way they gain a strip of wild undergrowth bordering a stream, which they visit regularly for the roots of the common wild hyacinth. The undulating portions of the New Forest are drained by means of narrow canals or gutters, which follow the ridings, generally being about two feet in depth and a foot in width. In due course these canals become overgrown with grass, a pitfall for the unwary, and they are very considerably used by the badgers as runways in passing from one place to another. It is possible for the animal to escape unseen within a yard or so of one's feet by means of these artificial cuttings; but their use entails a counterbalancing disadvantage from Brock's point of view, in that, though he is unseen, he himself cannot see, and should his keen nostrils fail to give him warning, he can very easily be surprised as he noses about the trench-bottom.

Seton states that a badger spends thirty hours underground for every hour it spends on the earth's surface, which is probably a pretty accurate estimate. Its whole mode of living is to come up for a few hours, gorge itself to the extreme limits of repletion, then remain underground or about the warren in a more or less torpid state till again hungry—possibly a period of four or five days.

In soft, sandy ground Master Badger, when disturbed, will sometimes bury himself where he stands, sooner than take to his heels, going practically straight down, like a mole; indeed, his powers of digging are almost proportionate to those of the mole. For this reason it requires a keen and plucky dog to keep a badger in one place in its earth while the diggers get down to it. A half-hearted dog, that does not keep its quarry employed defending itself the whole time,

is of no use to the badger-digger, for the badger immediately turns its tail to the dog and begins to scratch, throwing out a blast of sand behind that no animal can face, the dog having to draw off, blinded and suffocated, while Brock rapidly extends his tunnel. If one can succeed in stopping up the pocket behind the badger it can scratch no further, being unable to dispose of the earth it loosens, and thus it becomes jammed up, powerless to escape.

II.

The badger-warrens I have studied were all of them models of system and cleanliness. The animals never occupy a warren for more than two or three months at a spell; it is then completely forsaken for a corresponding period, and thus given a chance thoroughly to sweeten up, the colony removing themselves in the interim to another country residence, probably not more than a mile distant. In the meantime their old residence is taken over by rabbits. As regards the numerous stories one hears about Brock as a rabbit-killer, I can only say that I know of numerous warrens in which rabbits and badgers share the tenancy. Generally the rabbits occupy one end, while the badgers occupy the other, but all the holes are interconnected, and the little community appears to dwell in an atmosphere of perfect goodwill.

Brock is a slow-footed animal, and though, perhaps, he would possess few scruples if the opportunity of dining off Brer Rabbit occurred, it is not worth his while to hunt his active neighbour when there is so much other food ready to hand.

Badgers are a good deal troubled with neighbours of a more personal and intimate character, and the cleanliness they exercise in their home-life has not a little to do with these gentry. One can always tell whether or not a badger-warren is occupied by the condition of the bedding that litters the ground and carpets the entrance of every earth—the dry grass or bracken they use being strewn everywhere about the warren and along the runways. During every night of activity, which appears to be about one night in five, the animals, having fed, spend the small hours raking the old bedding out of the warrens and substituting new, dry material. A bed is never allowed to become old and stale, and the huge dump-heaps at the burrow-entrances will, if examined, be found to consist of 50 per cent. old bedding, drawn out and intermingled with the sand. Very often a single dump-heap of this kind would comprise several cartloads—the work of generation after generation of badgers who have occupied their spare time in tidying up and enlarging.

From the mouth of the main burrow there generally exists a clearly defined runway to the patch of open ground at which the bedding material is collected. Dry grass is preferred on account of its softness, but often badgers make

shift with bracken. Following the runway, one arrives at an opening amidst the trees (probably within a distance of fifty yards), from which all the low herbage has been dragged and clawed up, so that the whole little plot has an untidy appearance. (Indeed, the entire area of the warren is untidy owing to the litter of bedding, this being the chief indication that it is a badger-warren). This is the hayfield of the colony.

The grass or the bracken as collected is rolled into tightly packed balls, a number of which appear to be made in readiness for transportation when the badgers leave the field, as one often finds these balls lying forsaken on the ground; and the amount of bedding rolled into such small compass is surprising. The animal carries the ball between its chin and its forepaws, cuddling the bundle against its chest and half-pushing, half-supporting it in this way.

In addition to their nests underground, badgers make use of sunning-nests, which they construct for temporary use at the mouth of the main earth. This is a point concerning which many naturalists profess disbelief; but having seen such nests and photographed them, I am naturally satisfied.

The sunning-nest is a large and untidy bundle of bedding, trodden out to the curvature of the animal's body, just as a cat or a dog hollows out a bed for itself. Always it is placed directly above the mouth of the earth, so that, should its occupant be disturbed, he or she has nothing to do but roll out and tumble underground in the twinkling of an eye. Also, the nest is so situated that it catches the sunlight falling through the trees during the warmest hour of the day.

Though there are indications that a nest has at one time been in use at the mouth of the main burrow of almost every warren, one may search far and diligently before actually finding a nest itself; for, having sunned himself so long as the light lasts, it would appear that Brock drags the material into the earth after him, making good use of it below rather than allowing it to become damp and rotten on the earth's surface. Thus if one locates a sunning-nest, and returns only an hour or so later in order, perhaps, to photograph it, a hundred to one it will be gone—especially if one handled it on discovery. Nor has any man I have met actually caught a badger asleep in its sunning-nest. One might as well attempt to catch a fox asleep in a hen-house. Smith, the keeper at Boldrewood, tells me that on several occasions he has arrived to find the nest still warm by contact with the badger's body, but Brock himself had heard or winded the intrusion and tumbled underground with seconds to spare.

In sanitation the badger stands out as a model of system and virtue many beasts would do well to copy, the perfection of his sanitary arrangements being unrivalled by any woodland creature with the exception, perhaps, of the beaver. Only

once have I found any traces of uncleanness about the warren, which in this instance was occupied by young badgers, who evidently had not learnt the full value of cleanliness.

One of the most distinct runways from the main earth will be found to terminate, after a few paces, at a hollow in the ground—often the pit left after the filling in by the earth-stopper of an old burrow, which the family has not troubled to reopen. Here vertical holes (about six inches deep and four inches wide) are dug, each hole being used so long as its capacity permits, when another is dug close to it, and so on till the bottom of the pit becomes covered with these scratchings. Thereupon it is forsaken and an adjacent plot taken up, every warren having several of these special allotments, old and new, within easy reach of the burrows.

III.

Badgers, like bears, possess the habit of measuring their full height against some obstacle which affords exercise for their claws, and thither, to the recognised scratching-post, the whole family adjourns at more or less regular intervals to leave the sign of their passing. One sees the claw-marks of father and mother high up on the scale of reach; lower down are the claw-marks of the cubs, each having registered its height; and from surrounding signs we should judge that this is a recognised rendezvous of the family.

There is every reason to think that these scratching-places afford a system of intercommunication for the badger population of a given district, for I have noticed the claw-marks of strange badgers on a tree-trunk habitually visited by one family in a locality where badgers were none too plentiful. For example, an old dog-badger living alone has his own individual scratching-log, which he visits, perhaps, once every ten days. Near to the log is a boulder of rock having one sharp edge against which he invariably rubs himself when calling. Another badger crosses the range, and, guided by some subtle sense, it visits this place. It registers its height against the trunk, and scratches its neck on the other side of the sharp edge of rock. The owner of the rendezvous returns. He knows immediately that another badger has been there. Whether he is sufficiently astute to read if it is larger or smaller than himself is, of course, open to question, but at any rate the main question at stake is instantly conveyed to his conception. If it is a nomadic old dog-badger that has passed, he is not interested; but if, on the other hand, an eligible lady-caller has seen fit to leave the sign of her passing, he is all on edge. In all probability he follows, and so, in due course, they make each other's acquaintance.

Intercommunication in the wild exists for but one purpose—that of bringing the sexes together. The wolves have their calling-posts, the beavers have their castor-signs, the weasels

have their musking-places, and it is reasonable to think that the scratching-post of the badger answers the same purpose. It is the marriage-exchange of the district—the agony-column of the local press. Of course, a badger may exercise its claws against any tree it happens to pass, but always there is one tree in particular recognised for this purpose.

Moreover, a badger living in solitude resorts to the practice more regularly than the mated couples—may, indeed, have several calling-places all up and down its range, and the necessity for claw-exercise alone cannot demand such activity. It would seem that the more earnestly a dog-badger desires a mate the more blatantly does he advertise the signs of his stature, and the more diligently does he search for the records of other badgers left in the same way. That the habit plays some important part in the multiplication of the species can hardly be doubted, and possibly the old male badger wandering restlessly from place to place is searching chiefly for such signs.

IV.

I have studied the badger very closely, and I can honestly say that I have yet to discover this creature guilty of a crime sufficient to warrant its destruction even in a single instance. There is no doubt that should he stumble across a game-bird's nest Brock will devour its contents as greedily as he will devour the contents of a wasp's nest, but he certainly does not go out of his way to look for the nests of game-birds. In one case a pheasant brought off her brood amidst some long grass directly overlooked by an occupied warren, and within forty yards of it, and had the hunting of eggs been in any way the badgers' line of business, they could not have failed to locate this feast. The fact is that normally in the spring the badger is surrounded by such an abundance of food which requires no hunting that there is no need for it to hunt live prey; and since it is a slow-moving beast, it would not be exactly successful as a huntsman even were it so disposed. True, Brock has flesh-tearing teeth—and goodness knows he needs them for purposes of self-defence—but, like the black bear, he can and does subsist very comfortably on an exclusively vegetable diet with a little rubbish thrown in should he actually stumble across it in his short-sighted, pig-like forages. Except for the spring (when the badger has vegetable foods everywhere), the sort of game man protects is chiefly of the variety demanding and often defying the swiftness, cleverness, and long-sightedness of Reynard at his best. At all events the keepers of the New Forest, who know as much about badgers as any one, have no quarrel with them except that their many earths require a good deal of stopping before each meet of the fox-hounds, which is the only reason why badgers are kept in check in this region.

Roots, insects, worms, beetles, frogs, and

berries, when in season, are the chief food of Brock at home. In the forests of the Vosges Mountains, south of Verdun, there are many badgers, and during the war they seemed to lose much of their fear of man, often appearing on the mountain-roads quite near the muleteers, and occupying the forests right up to the fighting-line, apparently undisturbed by the noise of the guns, since no one had the time to hunt them. Here their food consisted entirely of the wild raspberries that are abundant on the open hillsides, while earlier in the season beetles and other insects formed their staple diet. In the New Forest they appear to live chiefly on beetles, destroying simply thousands of the common black-backed beetle, to be found in the roots of moss, the wings of which they do not digest. In winter roots, or almost anything soft they can nose out of the ground, are acceptable; in fact, the badger will eat nearly anything it happens to stumble across.

The badger does not hibernate in the true sense of the word. During a spell of wild winter weather it may considerably extend its periods underground—may not emerge, indeed, for two or three weeks; but immediately the conditions change it is up and about, as lively as at any other time of the year. In high, wind-swept country it makes this winter denning more of a permanency; while in warmer latitudes—the southern states of America, for example—the badger does not den up at all. During the chief period of hibernation Brock generally stops the mouth of the den to exclude draught, which would seem to indicate that his respiration at such times becomes very low; indeed, it must be something very near a death-like stupor that tides so heavy-feeding an animal over so long a period without food. But with practically every beast hibernation is merely a matter of convenience, which can be put off when desired, and the black bear of the Far North, which hibernates normally in the true sense of the word, is ready enough to remain awake and active when kept in captivity and liberally fed—even though its home be an Arctic trading-post. In this country, then, the badger hibernates if its environment and the conditions of the season demand it, but normally its hibernation is on a par with that of the squirrel, eagerly cut short should the wintry weather relent.

v.

I imagine the young, varying from three to five in number, are born in February, as I have seen their tracks on the 15th of March at the earliest. Generally they are to be seen at the mouth of the earth in March, seldom venturing for more than a few yards till early in April. In May the home-den is forsaken, the whole family journeying to a new warren. Sometimes, but not always, the dog and the 'sow' badger remain together the whole year round.

Badgers are not playful animals, and except in their cubhood they seldom frolic, devoting their time to the more important business of nosing for food. The old game of King of the Castle is said to be systematically indulged in by the cubs, even their mother occasionally lending a hand. One of the youngsters mounts a dead tree-stump or a boulder of rock, and from this point of eminence menaces his brothers with naked fangs. The others then set to work to drag him down, attacking from every point of the compass, while the central figure twists and turns, till finally he is dislodged and another scrambles into his place. And so the game goes on during the chilliest hour before the dawn; but it is a game unlike those of our own little people in that it is played in silence—such is the degree of caution instilled into the young by their parents.

This game is said to be a recognised institution of the badgers, each family having its own 'castle' and its special little plot laid aside, the ground soon becoming trodden hard and bare of verdure by the beating of active paws. Normally the youngsters just roll each other about, butting at each other and pulling at the loose skin of each other's necks, much like little bears, which they closely resemble in many ways.

Badgers are good-tempered beasts, and the old saying 'surlly as a badger' lacks support in actual fact. Naturally Brock is surly when imprisoned in a box and tortured by men and dogs, but I believe that in their home-life badgers live in perfect harmony, with never an ill word. And the devotion of the mother is heroic. She has been known to hold the den while her little cubs made good their escape, facing hopeless odds, and gamely meeting her death in covering their retreat. On this occasion the warren was invaded because, as the farmers said, the sow-badger had been proved guilty of killing young lambs. When she was dead and the cubs were gone the lamb-killing still continued, and finally it was traced to some far more likely, though less evident, cause.

Of course, there are exceptional badgers, just as there are exceptional terriers, but I doubt very much whether any terrier could hold its own in single combat, either closed or open, with an old fighting male badger or with a sow defending her young—taking it that the badger had not previously been scared out of its wits. Though retiring and peace-loving by disposition, this animal is a fierce and terrible fighter when roused, and long persecution has taught the badger to use its fangs and claws with deadly effect. Even when terrified by man, and forced to make a stand amidst surroundings and conditions new to it, a good badger will hold its own for an indefinite period against entirely hopeless odds; and fighting amidst its own chosen surroundings, uninterrupted by man, it would very speedily wear out and probably kill

a terrier handicapped by the conditions that were in the badger's favour. In other words—let a badger choose its own ground and do not interfere, and it will go badly with the terrier facing it, even though the terrier be of the best fighting blood obtainable.

There is much to rouse our sympathies in the character of this quiet dweller of the forest shadows, and it is sincerely to be hoped that such sympathies may prove instrumental in relieving this ancient and much-persecuted creature of some of the miseries that have so long and so unjustly been meted out to it. One sees in the badger a brave, indigenous beast struggling to retain a footing in the land of its heritage against the cruelty and ignorance of those who

still seem to regard it as designed for the 'sport' of man. The badger was once diurnal to almost the same extent as it was nocturnal. Where undisturbed by man it is still diurnal in its habits. In this country, by sorrowful experience, it has become solely nocturnal. It has retreated to the depths of our deepest forests in the hope of finding security from man, and every movement of its life is characterised by the sober desire to avoid contingencies with man and his dogs. Because the badger is a brave and able fighter, it has been used as a means of trying out the mettle of beasts as brave and able as itself, which, in the broad light of things, savours of the barbarous, and of a spirit hardly worthy of the lovers of cricket.

THE PARTS MEN PLAY.

CHAPTER XIV.—STRANGE CRAFT.

I.

ONE slushy night in December Selwyn was returning from a solitary dinner at a modest Holborn restaurant, when a damp sleet began to fall, making the sickly street-lamps darker still, and defying the protection of mufflers and heavy coats. With hat pulled over his eyes and hands immersed in the pockets of his coat, he made his way through the throng, while the raucous voices of news-venders cried out the latest tidings from the front.

To escape the proximity of the crowds and the nerve-shaking noises of traffic, he turned down a wide thoroughfare, and eventually emerged on Fleet Street. Again the seething discontent of rumbling omnibuses and hurrying crowds irritated him, and crossing to Bouverie Street, where Mr Punch looks out on England with his genial satire, he followed its quiet channel until he reached the Thames.

In contrast to the throbbing arteries of Holborn and Fleet Street, the river soothed his nerves and lent tranquillity to his mind. Following the Embankment, which was shrouded in heavy darkness, he reached the spot where Cleopatra's Needle, which once looked on the majesty of ancient Egypt, stands, a sentinel of incongruity, on the edge of London's river. Giving way to a momentary whim, Selwyn paused, and finding a spot that was sheltered from the sleet, sat down and leaned against the monument.

In the masque of night he could just make out the sketchy forms of a river-barge and two steamers anchored a few yards out. From their masts he could see the dull glow of red where a meagre lamp was hung, and he heard the hoarse voice of a man calling out to some one across the river. As if in answer, the rattle of a chain came from the deck of some unseen craft, like a lonely felon in a floating prison.

The river's mood was so in keeping with his own that Selwyn's senses experienced a numbing pleasure; the ghostly mariners of the night, the motionless ships at their moorings, the eerie hissing of the sleet upon the water, combined to form a drug that left his eyelids heavy with drowsy contentment.

How long he had remained there he could not have stated, when from the steps beneath him, leading towards the water, he heard a man's slovenly voice.

'Are you going to stay the night here?'

As apparently the remark was intended for him, Selwyn leaned forward and peered in the direction from which the voice had come. At the foot of the dripping steps he could just make out a huddled figure.

'If you're putting up here,' went on the speaker, 'we had better pool resources. I've got a cape, and if you have a coat we can make a decent shift of it. Two sleep warmer than one on a night like this.'

In spite of the sluggish manner of speech, Selwyn could detect a faint intonation which bespoke a man of breeding. He tried to discern the features, but they were completely hidden beneath the pall of night.

'Well,' said the voice, 'are you deaf?'

'I am not staying here for the night,' answered Selwyn.

'Then why the devil didn't you say that before?' For a moment the fellow's voice was enlivened by a touch of brusqueness, but before the last words were finished it had lapsed into the dull heaviness of physical lethargy. 'Tell me,' said the stranger, after a silence of several minutes, 'how is the war going on?'

'You probably know as much as I.'

'Not likely. I've been beating back from China for three months in a more or less derelict tramp. Chased into every blessed little port,

losing our way, and cruising for days without water—we were a fine family of blackguards, and no mistake. Grog could be had for the asking, and a scrap for less than that—but I'd as lief not ship on the *Nancy Hawkins* again.'

Selwyn leaned back against the obelisk and speculated idly on the strange personality hidden in the dark recess of the descending stairs. It was not difficult to tell that, though he spoke of himself as a sailor, sailing was not his calling. There was a subtle cadence of refinement in his voice, an arresting lilt on certain words, that remained on the air after the words had ended.

'Did the Germans get to Paris?'

'No,' said Selwyn; 'though they were very near it.'

'Good! How did our chaps do?'

'I believe they fought very bravely, but were pretty well wiped out.'

'I suppose so,' said the other quietly—'wiped out, eh? Tell me—did the Colonies throw in their lot with us?'

'All of them,' said Selwyn, 'even including South Africa.'

'What about Canada?'

'She has over thirty thousand men in England now, ready to cross.'

'Splendid!' muttered the fellow. 'So they're British after all, in spite of the Yankees beside them. . . . The cubs didn't leave the old mother to fight alone, eh? Jove! but it's something to be an Englishman to-day, isn't it?'

Selwyn made no response, but his brow contracted with the thought that even the flotsam, the dregs thrown up on the river's bank, were imbued with the overwhelming instinct of jingoism. He glanced up from the steps, and saw on either side of the obelisk a sphinx, woman-headed, with the body of a lioness, monuments to the memory of Cleopatra. How little had been accomplished by humanity since the first sphinx had gazed upon the sands of Egypt! It had seen the treachery and the lust of Antony, the slaughter of men by men led blindly to the carnage. . . . Was not the smile, perhaps, its hoarded knowledge of the futility of the ages?

'Can you give me a match?' asked the man from the steps. 'Everything on me is soaked. I'll come up if you have one, but I don't want to shift otherwise.'

'Don't bother,' said Selwyn, getting up and stamping his feet to restore their warmth. 'I'll bring you one, and then I'll have to move along.'

He produced a silver match-box, and feeling his way carefully down the slippery steps, handed it to the stranger. Acknowledging the action with a murmur of thanks, the fellow took it, and making a protection with his cape, struck a match to light his pipe. It flickered for a moment and flared up, illuminating his features grotesquely.

Selwyn uttered a sharp ejaculation of surprise and stepped back a pace. 'Durwent!' he cried.

'Eh?' snapped the other, dropping the match on the wet stone, where it went out with a faint splutter. 'What's your game?'

'I could not see you before,' said the American quickly; 'but though I only heard your voice once, there was something about it I remembered.'

The Englishman struck a second match, and with a casual air of indifference lit his pipe.

'Thanks,' he said, handing the box to the American. Selwyn reached forward to take it, when suddenly his wrists were caught in a grip of steel.

'Damn you!' said Dick Durwent hotly, springing to his feet. 'Are you tracking me? I didn't come back to be caught like a rat. Are you a detective? If you are, by George! I'll drown you in the river.'

'Don't be a fool,' said Selwyn, writhing in pain with the other's torture.

'Who are you?'

'My name is Selwyn. I am an American; a friend of your mother and sister.'

'Where have you seen me before?'

'At the Café Rouge—a year ago.' Beads of perspiration stood out on Selwyn's head, and his body was faint with the pain of his twisted wrists.

'You're not lying?' said Dick Durwent, slowly relaxing his grip, and peering into the American's eyes. 'No. I seem to remember you somewhere with Elise. I'm sorry.' He released the clutch completely, and resumed his seat on the steps. 'I hope I didn't hurt you.'

'No,' said Selwyn, rubbing each wrist in turn to help to restore the circulation.

Durwent laughed grimly. 'It's a wonder I didn't break something,' he said. 'Once more—I'm sorry. But you can understand the risk I am running in returning here with the police wanting me. They're not going to get me if I can help it.'

'Why didn't you stay away?'

'With the Old Country at war! Not likely. Do you think I should ever have gone if I had known what was going to happen?'

'What are your plans?'

'Fight,' said the other briefly. 'Somewhere—somehow. I'll get into a recruiting line about dawn to-morrow. . . . But—what can you tell me about Elise?'

'I have neither seen nor heard of her since August,' said Selwyn, wondering at the calm level of his own voice in spite of tumultuous heart-beats.

'Too bad. Then you don't know anything about the rest?'

'No. I'— He paused awkwardly. 'I suppose you haven't heard about your brother?'

There was no response, but Selwyn could feel the Englishman's eyes steeled on his face. 'He was killed,' he went on slowly, 'last August.'

Still there was no sound from the younger son, now heir to his father's title and estates. For the first time Selwyn caught the ripple of the river's current eddying about the steps at the bottom. From the great bridges spanning the river there was the distant thunder of lumbering traffic.

'I understand that he died very bravely,' said the American in an attempt to ease the intensity of the silence.

'Yes,' muttered Durwent dreamily, 'he would. . . . So, old Malcolm is dead. . . . Somehow, I always looked on his soldiering as a joke. I never thought that those fellows in the Regulars would ever really go to war. . . . Yet, when the time came, he was ready, and I was skulking off to China like a thief in the night.'

The Englishman's voice was so low that it seemed as if he were talking more to himself than for his listener.

'What happened to that swine?' he ejaculated suddenly. 'I mean the one I almost killed. By any chance, did he die?'

'I saw in a paragraph last week,' said Selwyn, 'that he was out on crutches for the first time. The paper also commented on your complete disappearance.'

'I wish I had killed him,' said the young man grimly. 'If I ever get a chance I'll tell you about him. I was drunk at the time—that's what saved his life. If I had been sober I should have finished him. Well, it's a damp night, my friend, and I won't keep you any longer from a decent billet.'

'Look here, Durwent,' said Selwyn; 'come along to my rooms. You're soaked to the skin, and I could give you a change and a shakedown for the night.'

'Thanks very much; but I'm accustomed to this kind of thing.'

'You won't be seen,' urged Selwyn. 'I have accepted so much from your family that you would do me a kindness in coming.'

'Well, I must say I'm not married to this place. If you don't mind taking in a disreputable wharf-rat'—

'That's the idea,' said Selwyn, helping him to his feet. The Englishman shivered slightly.

'You haven't a flask, have you?' he queried. 'I didn't know how cold I was.'

'I haven't anything with me,' said the American; 'but I can give you a whisky and something to eat at the rooms.'

'Right! Thanks very much.'

Tucking the cape under his arm, and shaking his waterproof cap to clear it of water, Dick Durwent followed the American on to the Embankment, where the two sphinxes of Egypt squatted, silent sentinels.

II.

To avoid the crowds as much as possible, the two men followed the Embankment, and had

reached the Houses of Parliament, intending to make a detour into St James's Square, when Selwyn felt a hand upon his shoulder. He turned quickly about, and Durwent moved off to one side to be out of the light of a lamp.

'Sweet son of liberty,' said the new-comer, 'how fares it?'

It was Johnston Smyth, more airily shabby than ever. Over his head he held an umbrella in such disrepair that the material hung from the ribs in shreds. A profuse black tie hid any sign of shirt, and both the legs of his trousers and the sleeves of his coat seemed to have shrunk considerably with the damp.

'How are you?' said Selwyn, shaking hands.

'Temperamentally on tap; artistically beyond question; gastronomically unsatisfied.' At this concise statement of his condition, Smyth took off his hat, gazed at it as if he had been previously unaware of its existence, and replaced it on the very back of his head.

'Things are not going too well, then?' said Selwyn, glancing anxiously towards Durwent, and wondering how he could get rid of the garrulous artist.

'Not going well?' Smyth straightened his right leg and relaxed the left one. 'In the last three weeks a pair of pyjamas, my other coat, two borrowed umbrellas, and a set of cuff-links have gone. If things go much better I shall have to live in a tub like Diogenes. But—do the honours, Selwyn.'

'I beg your pardon,' said the American. 'Mr—Mr Sherwood,' he went on, taking the first name that came to his lips, 'allow me to introduce Mr Johnston Smyth.'

'How are you?' said the artist, making an elaborate bow and seizing the other's hand. 'As you may have gathered from my costume and the ventilated condition of my umbrella, I am not in that state of funds which lends tranquillity to the mind and a glow of contentment to the bosom. Yet you see before you a man—if I may be permitted a sporting expression—who has set the pace to the artists of England. I am glad to know you. Our mutual friend from Old Glory has done himself proud.'

With which flourish Smyth left off shaking hands and closed his umbrella, immediately opening it and putting it up again. Dick Durwent replaced his hands in his pockets, and Selwyn heard his quivering breath as he shivered with cold.

'However,' went on the loquacious artist, 'though my art has been heralded as a triumph, though it has filled columns of the press, though my admirers can be found on every page of the directory, I can only say, like our ancient enemy across the Channel, after Austerlitz, "Another such victory and I am ruined!" . . . Selwyn, shall we indulge in the erstwhile drop?'

'Have you a flask?' broke in Durwent, his dull eyes lighting greedily.

'I think not,' said Smyth, handing the umbrella to Selwyn, and carefully searching all his pockets. 'I am afraid my valet has neglected that essential part of a gentleman's wardrobe. But what do you say, gentlemen, to a short pilgrimage to Archibald's?'

'No, Smyth,' said the American, putting his hand in Durwent's arm. 'For certain reasons, Mr Sherwood'—

'Ha!' said Smyth, with a dramatic pose of his legs, 'Archibald is the soul of discretion. Compared to him, an Egyptian mummy is a pithy paragrapher. *Mes amis*, Archibald's is just across the bridge, and I can assure you that the Twilight Tinkle, in which I have the honour to have collaborated, is guaranteed to change the most elongated countenance of glum into a globular surface of blithesome joy.'

'No'—began Selwyn impatiently.

'Let us try it,' said Durwent eagerly. 'I think this chill has got into my blood. I'd give a lot for a shot of rum or brandy.'

'We can have anything in my rooms,' protested the American. 'You want to get your wet things off—and, besides, it's a risk going in there.'

'No risk—no risk,' said Durwent, laughing foolishly and rubbing his hands together.—'Where is this hole, Smyth?'

'Gentlemen,' said the artist, 'after the custom of these military days, I urge you "fall in."'

Getting in the centre and adjusting his hat at a precipitate angle on the extreme left of his head, Smyth took Dick Durwent's arm, and extending the other to Selwyn, marched the pair across the bridge, holding the absurd umbrella over each in turn as if it offered some real resistance to the scurvy downpour.

(Continued on page 311.)

INDIAN FRONTIER REMINISCENCES.

By C. G. NURSE.

I.

THE staff-officer at Bombay placed in my hand a paper which read as follows: 'You will proceed to join the —th Bombay Infantry at Sibi, travelling expeditiously by sea and rail at the public expense.'

'Where on earth is Sibi?' I inquired.

'It is quite a small place in the Quetta district, and I expect you will find your regiment in camp, so you had better take a tent.'

'How do I get there?'

'By sea to Karachi, and thence by rail. There is a boat leaving here on Saturday; if you will call at the office again to-morrow, I will arrange for your passage, and have your railway warrant ready.'

I had recently arrived in Bombay from England as a probationer for the Indian Staff Corps (now the Indian Army), after serving four years in a British regiment. During a previous tour of duty in India I had passed in Hindustani, and, finding home service rather slow and decidedly expensive, I had determined on an Indian career. At the time of which I am writing—namely, the year 1885—service in the Quetta district was not at all popular with either Europeans or natives, and I was by no means overjoyed when I learned my destination. However, it is no use quarrelling with the decrees of either Fate or one's military superiors, so I prepared to make the best of it, and in due course reached Karachi. Here I met a deputy-surgeon-general, who had recently returned from a tour of inspection in the Quetta district. I eagerly inquired of him particulars regarding the country and the climate, and did not feel at all reassured when he informed me that the water contained germs

of nearly every possible disease, and that he had, in fact, taken with him his own supply for drinking purposes. I afterwards ascertained, much to my relief, that he was considered almost a monomaniac on the subject, and there was a standing joke at the club about 'splitting a bottle of water with Dr H—.'

On arrival at Sibi I found that my regiment was no longer there, but had gone on to Quetta. Sibi was in those days the terminus of the railway, and the journey on to Quetta through the Bolan Pass had to be performed by road, the distance being about sixty miles. The country through which I passed was weird in the extreme; great bare hills rose on either side of the road, which wound ribbon-like through dark gorges, until the *kòtal*, or highest point, was reached. Then came a descent for a space into the barren Dasht-i-be-daulat (literally, 'wealthless plain'), which extends to within a few miles of Quetta.

It is always something of an ordeal for a young man to find himself in a new corps, when not only the personalities and tastes of his brother-officers, but even the ideas and habits of the rank and file, are strange to him. However, my new comrades did their best to put me at my ease; and the colonel, after giving me a few days to settle down in my new surroundings, placed me in charge of the regimental transport, which consisted of 250 mules and their attendants.

I knew nothing about mules, and very little about natives; but it was a fine opportunity of gaining experience, and I did my best to maintain order among a rather unruly crowd of men and animals. The lot of the muleteer (or *drabi*, as he is generally called, this being the native rendering of the English word 'driver') is never a very easy one, and in those days was particu-

larly hard in the Quetta district. These men had to travel long distances with Government stores under most uncomfortable conditions; and even when at Quetta their quarters consisted of wretched huts, affording but scanty shelter from cold and wet. On winter mornings a certain amount of *fortiter in re* was necessary to get them out of their huts for 'stables.' I found that a little red pepper thrown on the fire would render a hut untenable in the shortest possible time; and, once the men were outside, they could easily be induced to attend to their duties. The majority of the men were 'scallywags' and ne'er-do-wells, whose chief relaxation was gambling, but I never had any serious trouble with them. A little sympathy goes a long way with natives of India, and when they found that I was ready to listen without impatience to long stories about their domestic concerns, they would come to me for advice on all kinds of subjects, from the recovery of a gambling debt to the punishment of a runaway wife. A native always likes to have some one to whom he can relate his troubles; and if my advice was not always followed, at any rate I obtained considerable insight into Indian habits and modes of thought.

II.

The late Sir Robert Sandeman was, in the 'eighties, the chief power in Baluchistan, and his influence among the turbulent tribesmen was immense. Stout of figure, rosy of face, and careless in his dress, he looked like a burly farmer from East Anglia. He thoroughly understood the local tribesmen, and, if his methods of dealing with them were at times unconventional, he usually managed to 'make the punishment fit the crime.'

A year or so before my arrival in Baluchistan, a young subaltern, one of my contemporaries at the R.M.C., Sandhurst, was murdered in a rocky gorge a few miles from Quetta. A considerable number of the inhabitants of a neighbouring village were implicated in the crime; the ring-leaders were duly arrested and punished, and Sir R. Sandeman ordered the village to which they belonged to cultivate for ever on behalf of Government a piece of land near Quetta in expiation of their offence, and as a warning to others.

Sandeman was quite fearless, and must have had many narrow escapes. A friend once told me that, during the latter part of the Afghan war, he was in command of Sandeman's escort in a very wild part of the country, where the tribal chiefs had been summoned to discuss certain matters that were at issue between them and the British Government. The chiefs were inclined to resent interference, but Sandeman harangued them, and spoke his mind in no measured terms, standing among them quite unarmed. He had sent his escort some distance away, and the officer in command noticed that

while he was speaking two of the tribesmen were seated behind a rock with their rifles levelled at him. After the meeting he mentioned the matter to his chief, who said, 'I was quite aware of it; but I should be unworthy of my post if I allowed myself to be influenced by fear of personal danger.'

Another conspicuous figure frequently seen at Quetta was the late Sir James Browne, always known as 'Buster Browne,' who was then in charge of the construction of the Harnai railway. This undertaking involved such enormous expense that the head of the financial department remarked that 'Browne must think in *lakhs*.' He was a man of powerful build, who had been a famous athlete in his youth. He was once at a gathering of tribesmen when a local wrestler was boasting of his prowess, and challenged all comers. Browne, who was then well over forty-five, accepted the challenge, and easily defeated his adversary, who retired with a broken collar-bone.

III.

Quetta was, in the days of which I am writing, still in the making, and a considerable number of R.E. officers were employed there, superintending the building of barracks and Government offices. The senior R.E. officer was a man of very mild appearance, who had the reputation of being 'as wise as a serpent and as harmless as a dove.' He was, however, a glutton for work, and did his best to keep those under him up to the mark. One of his officers, a young R.E. captain, though of undoubted ability, was of an extremely leisurely nature. On one occasion his chief sent for him, and inquired whether certain plans, which he had had ample time to prepare, were ready. The reply was in the negative.

'But what have you been doing for the last fortnight?' inquired the colonel.

'I have been writing a little poem, sir,' replied Captain L—, producing a manuscript from his pocket. 'Perhaps you would like me to read it to you.'

The climate of Quetta is pleasant enough during the greater part of the year, though it is hotter in summer and colder in winter than that of the British Isles. April is often a delightful month, and the fruit-trees in blossom make one dream of an English spring. But during the 'eighties it was so unhealthy that we used to say that the year might be divided into the pneumonia season, the fever season, the cholera season, and the autumn, when one might contract any or all of these diseases. Nearly all the houses leaked abominably, and I frequently had to move my camp-bed all over the room in seeking for a dry spot. The death-rate was very high, and the Indians, especially those from the Bombay side, hated service in Baluchistan. Servants were difficult to obtain, even at very high wages, and were

apt to desert as soon as the weather became unpleasantly cold. Natives of this class, when they become ill, generally make up their minds that they are going to die, and, in fact, often succumb because they will not make a fight for life. They do not all, however, settle their affairs as carefully as was the case with a servant of one of my brother-officers. He was taken ill about the 23rd of the month, and died on the 25th. When his master came to overhaul his effects, he found that his household accounts had been made up to the end of the month, even to the pettiest detail.

During the mid-'eighties Rudyard Kipling, then quite unknown to fame, was working at Lahore on the staff of the *Civil and Military Gazette*, in which paper some of his early verses and short stories appeared from time to time. I remember being much impressed with his power as a writer when I read 'The Strange Story of Morrowby Jukes, C.E.,' which appeared about this time in a small volume entitled *The Quartette*. I believe that this was his first story that was published outside the pages of a newspaper; the remaining stories were contributed by other members of the Kipling family. The booklet in which they appeared is now very scarce, and is eagerly sought after by collectors of first editions of his works. I do not know whether he ever came to Baluchistan, but in 'The Story of Uriah' he sends Jack Barrett to Quetta as being the most unhealthy station in India. Many waters have passed under the bridges since those days; Kipling's works are known and read wherever the English language is spoken; and Quetta has now become one of the most popular stations in the East!

Although there was no church at Quetta at that time, we had a chaplain, and were occasionally visited by the Bishop of Lahore, whose diocese extends to Baluchistan. The bishop, like the apostles of old, was content with very humble accommodation, and on one occasion put up in the dāk bungalow, where he was found by the padre preparing his sermon under the shelter of an umbrella, which he had spread to keep off the rain which was dripping freely through the mud roof. Divine service for the troops was always held in the open, and after one of the bishop's visits the chaplain received from a member of his flock an envelope containing the following lines:

May the Bishop of Lahore come to Quetta no
more,
For his sermon's too long, and the sun is too
strong
For Tommy Atkins to stick it.

A few months after joining my new regiment, I began the study of Persian under the auspices of a local *munshi*. After I had made some progress in the language, in order to improve my command of the colloquial, I used to spend an hour every afternoon in the bazaar, sitting

outside a fruit-seller's shop, talking to him and to any one who would speak Persian to me. One day I asked my friend the fruit-seller whether he knew any English, and he replied, 'One word only.'

'What is it?' I inquired.

'*Ickshaw tree exes.*'

'That does not sound like English. What does it mean?'

He put his hand behind the cushion on which he was sitting and produced a half-empty bottle of Exshaw's Three Star brandy.

I inquired how long he had acquired the habit, and he replied, 'Of course, I am a Mussulman, and only take it medicinally for internal pains, which,' he added, with a twinkle in his eye, 'come on every evening'!

IV.

When I had become fairly conversant with my duties in a native regiment, I was sent to take over command of a detachment at Rindli, a small place at the foot of the Bolan Pass. The climate of these regions is intolerably hot in the summer, and there is a saying current in this part of the world: '*Sibi o Dàdar dashteed, Dozakh chira sakhteed?*' ('When thou hadst Sibi and Dàdar, why didst thou create Hell?'), Sibi and Dàdar being the two best-known villages in the neighbourhood.

During the latter half of 1885 war with Russia seemed almost inevitable, and enormous quantities of stores and transport animals had been collected at Rindli, to which point the railway had been extended. It was one of the duties of my detachment to guard these stores, which, as the war-cloud dispersed, were either sent back to India or sold locally for a tithe of their original cost. I saw ponies sold for about a rupee each, and one of my friends bought a couple of them, which, after training, became fair polo-ponies, and eventually realised several hundred rupees.

My detachment consisted of about sixty men, with one subadar, a fine old gray-bearded Sikh of about fifty years of age. On my arrival I found that the native officer was ill, and was being treated in his own quarters by a native hospital assistant. I paid him a short visit, and found him very despondent about himself. A few evenings later, just as I was retiring for the night, I received an urgent message from him that he was dying, and wished to see me. I hastened to his quarters, which were in a separate room attached to the building occupied by the N.C.O.'s and men.

The subadar made an effort to sit up in bed and salute me; he apologised for disturbing me at such an unusual hour, and said, '*Huzur*, I wish to speak to you alone.'

Three or four Sikhs were present in the room, so I sent them outside, and said, 'Subadar sahib, now speak whatever is in your heart.'

'Huzûr, I am very weak and ill, and what I have to say to you must reach no other ears. Is the door securely fastened?' I assured him on the point, and he proceeded: 'I am certainly going to die. I have in a belt round my waist forty *tolas* of gold' (value about eighty pounds). 'No one knows of this, and if I die, unless your Honour sees to the matter, the money will be taken by those who were just present. I want you to see that the gold reaches my wife, and if you will undertake this I can die content.'

I tried to persuade him that he was not so ill as he imagined, but gave him the required promise that, in the event of his death, I would see that his savings reached his wife. I had seen the subadar only once before, and it was, therefore, not in any way due to my personal influence that he should turn to me in an emergency. The men who he feared would steal his money were his constant companions, shared his meals with him, and some of them were his blood-relations, while I was practically a stranger. But I was a 'sahib,' and he felt that he would rather trust me than those of his own race and caste.

I have told the story at some length to illustrate the prestige that a British officer commands with natives of India. I served in the Indian Army for upwards of twenty years after the above-recorded incident, and, so far as I am able to judge, this prestige had in no way diminished, at any rate among the fighting races, up to the time when I retired. I may mention that the native officer did not die, but, after a period of sick-leave, returned to duty, and eventually obtained his pension.

Sikhs were at that time freely enlisted in the Bombay regiments, and, owing to their soldier-like qualities and capacity for command, a good proportion of them became native officers. The jemadar who was sent to take the old subadar's place was also a Sikh. I should, perhaps, explain, for the benefit of readers who do not know northern India, that men of this class never cut their hair, but fasten it in a knot underneath the *pugri*. There was a small camping-ground near the native infantry lines at Rindli which we were ordered to keep clear, so that it might be available whenever troops halted there on their way to and from Quetta. One day when I went to visit my men the jemadar rather excitedly reported to me that the leader of a Pathan *kafilâ* had tried to encamp on this ground during the early hours of the morning.

'But, sahib,' he added, 'I drove him away, leaving my mark on his face.' Then, producing an old and very dirty official envelope, he drew from it a handful of grayish hair, which he explained had been torn out of his head in the struggle.

An hour or two later an elderly Pathan appeared with his face bound up. He in turn showed a handful of his henna-dyed beard,

which he asserted had been pulled out by the native officer. Both parties were quite ready for another scrap, but I managed to prevent any actual conflict by suggesting that if the Pathan were not satisfied he had better apply to the civil authorities for a summons. I knew very well that this would involve him in delay and consequent loss of money, and he finally pocketed his pride and departed, muttering guttural curses in Pushtu.

v.

During my tour of duty at Rindli one of the staff-officers of the Quetta district came there on inspection duty, and stayed with me for a few days. I was very glad of his companionship, as he was a genial personality, and possessed a ready wit. A change in the command of my regiment took place about this time, and my new C.O. passed through on his way to Quetta. I heard of his arrival at the dâk bungalow, and consequently put on my uniform, in order to call on him and make his acquaintance.

My friend the staff-officer, seeing me in uniform, inquired where I was going, and when I informed him, he remarked without a moment's hesitation, 'So you are going to place the egg of politeness under the hen of authority in order that it may hatch into the chicken of promotion, as you would say in Persian.'

He knew that I was studying the language, and his remark was a very good imitation of the picturesque phraseology of a Persian sentence.

The duties that an officer has to perform when serving on the outskirts of the Empire are extraordinarily varied, and while at Rindli I had to superintend the interment of several Europeans in the little cemetery. One of them was a Roman Catholic, and, there being no priest available, nor any one belonging to that community who could read sufficiently well to conduct the funeral, I was obliged to read the burial service in Latin out of a prayer-book lent me by a Goanese cook. Another was the infant son of an Englishman working as a foreman or petty contractor on the Harnai railway, and this was rather a pathetic case. The father came to my house one morning, bringing a tiny coffin, and asked where he could find a minister. There was no padre of any denomination within reach at the time, and he consequently asked me to arrange for the funeral and read the service. On our return from the cemetery, he remarked, 'I should not have come all this way to bury a girl; but as it was our only son, my wife insisted on his being properly buried. I shall let her think that a minister performed the ceremony; and, at any rate, the poor little fellow lies in consecrated ground.'

After spending several months at Rindli, I was relieved by another regiment, and took my detachment back to Quetta to rejoin head-

quarters. The railway was then being built up the Bolan Pass, and a considerable number of Europeans were employed on its construction. Some of them had their wives with them, and life being hard and dull, they conceived the project of having a dance to relieve the monotony of existence. My regiment was asked for the loan of our band for the occasion, and any officers who could be spared from duty were invited to the dance, which was to take place about thirty miles from Quetta. The line was sufficiently forward for construction trains to run, and an engine and a couple of carriages were detailed to transport band and guests to the scene of gaiety. When the train conveying the party had covered about half the distance from Quetta, the driver stopped the engine, and sent word to the colonel, who was among the guests, that he would not move another yard till the band played. The man had been drinking heavily, and argument proved quite useless, so at last an order had to be given for a march to be played, when the journey was duly continued.

About this time I paid a flying visit to Peshin, one of the out-stations of the Quetta district. The garrison, which was accommodated in a large mud fort, consisted of a squadron of native cavalry and a Baluch regiment, and was under the command of Colonel (afterwards General) Nicholson. Tall and heroic in appearance, he

was at that time one of the most notable figures on the frontier, and many stories were told of his intrepid feats. He was somewhat unconventional both in his ideas and in his methods. On one occasion a man of his regiment shot at him on parade; the bullet missed him, and Colonel Nicholson, instead of having the man arrested and tried by court-martial, promptly rode at him, and, dismounting, gave him a thorough thrashing. Nicholson married, somewhat late in life, the talented lady who, under the *nom-de-plume* of 'Laurence Hope,' wrote *The Garden of Kama*, which contains poems of great beauty. Some of her verses, notably 'Pale hands I loved beside the Shalimar,' have been set to music, and are now widely known.

On the completion of two years' service in the Quetta district, my regiment was transferred elsewhere, and I did not revisit Baluchistan for nearly twenty years. Quetta had by this time changed out of all recognition; substantial bungalows and excellent barracks had been erected, and, thanks to an improved water-supply, the station has now become one of the healthiest and most popular in the Indian Empire. The hills in the neighbourhood afford a fine training-ground for troops, the garrison is sufficiently large to support an excellent club and a pack of hounds, and any military officer who now finds himself under orders for Quetta may consider himself in luck's way.

THE INFRA RED RAY.

PART II.

I.

GRANT HASWELL took a last sip of his coffee (now quite cold), lit another cigarette with the stump of the one he had smoked to perilously small dimensions, settled himself more comfortably on the 'moleskine' bench, his legs outstretched beneath the table, and leisurely resumed his narrative.

'Crossing the ruined railway in the shadow of a partly demolished bridge, we glided into the shadow of a long brick wall holed by shell-fire. It had grass growing beside it, which deadened our footfalls. We proceeded to the right, or in the direction of the *crassier* which sloped up from our front line, and should have been in full view of the enemy had it been daylight. An occasional Very light caused us to pause on our way, till we reached the end of the wall and passed through a shell-hole on to the shale of the *crassier*, which sloped up at an angle of about forty-five degrees. The fine shale made our footfalls silent, and the clear silhouette of the *crassier* gave us no anxiety regarding a lurking observer above us.

'In this way we got round to the side immediately facing Fosse 16 and the German position,

and began to ascend in the direction of a mass of timber and wreckage near the old engine-house on the plateau-like top. Here we halted, and lay down in a depression between two sets of tram-rails. It was a perfect night for the work we had in hand, and the silence was unbroken except when a machine-gun rattled through half a belt somewhere in the distance. We lay there and listened intently for any suspicious sound, and as we strained our ears we heard the dull whirr of an electric motor and the thud of a pump somewhere in the ruined buildings of the fosse.

"Water-Supply Corps," whispered the sergeant; "we get our drinking-water out of this pit." Then he added, "There's an O.P. in those buildings too; we're wired up to it."

'A sound close at hand made us all suddenly alert. It came from a pile of sleepers, arranged in a square, some of which were splintered by a shell which had left a crater near by. It was a dull, mechanical beat, with pauses, sometimes, of nearly a second between the groups of beats. "Morse," whispered the sergeant, pulling out a muddy notebook and pencil. Two long beats, pause; three long beats, pause; one short, one long, one short. "Mor," he translated. The

sergeant continued writing for several minutes, till the sounds ceased and we read: "Morgen um neun uhr—Nein—B6. C.5.8" ("To-morrow at 9.0—No—B6. C.5.8").

"That's a map of reference," said Jessop quietly, "and the position referred to is a dump of T.M. ammunition. Jove, what casualties we'll have if they explode it! I must leave you now and get it shifted," he added.

"Don't worry; we'll make him cancel those arrangements if we can," I assured him. "Wait here whilst I have a nearer look at this outfit."

II.

'Directed by the occasional clicks which showed that the spy was answering a message being sent to him, I crept slowly forward, and soon came on a battered wrought-iron pipe, buried in the shale and projecting from it a couple of feet. It was about eight inches in diameter, and the projecting end was riddled with bullets or shrapnel and much corroded from exposure.

'As the apparatus worked I could see nothing—no light, no movement whatever. Then from a few yards away I heard a muttered exclamation. It was German, and it came from the hollow pile of sleepers. I crawled slowly forward, and saw an infinitely small speck of light issuing from a chink beneath the bottom sleeper of the pile. I placed my eye to this small opening and looked down. Below was a well-lighted table covered with maps and sketches, notes filed on pieces of wire or weighted with a piece of shale, and parts of what seemed to be an apparatus involving lenses or reflectors, a plush-lined receptacle for which lay against the wall in the centre. On an empty ammunition-box sat a man in the uniform of a British private soldier, his jacket open at the neck and steel helmet beside him on the floor, whilst against the wall was a service rifle, a coil of insulated wire, and a field telephone. His uniform was dirty, and on the sleeve was a square of soiled blue-and-white serge. He was sitting looking down, with his head supported by an arm, the elbow of which rested on the table. Above his head the iron pipe through which I had heard the signals projected from the wall in front, and attached to the end of it was a piece of apparatus connected with the table by two strands of twisted insulated wire, which disappeared through two holes drilled in it, reappearing in the same way by two more holes, opposite a Morse key, with which the man was toying with his free hand. I could not see his face, nor any entrance to his retreat from the top or the sides, and the floor was too much in the shade for me to discern any opening there.

'I returned quietly to my companions and informed them of my discovery, and it was decided that Jessop should keep the German

covered with his revolver, whilst I and the sergeant endeavoured to find the entrance to his dug-out.

'We saw Jessop to the chink, and he said that his bullet would easily find a way through in case of necessity, though, as the spy was still dozing, it seemed unlikely that he would have need to use his weapon. I felt pretty sure that there was some kind of trap-door and tunnel leading to the place, for such an arrangement could almost have been made by hand in the loose shale, provided timbering were employed. We therefore first searched the face of the *crassier* below the dug-out, but were disappointed in our quest. We then came up to the pile of sleepers, and, with them as a centre, crawled round among the wreckage in gradually widening circles till we came on an ordinary iron man-hole such as is used for the inspection of drains in our streets at home. This fitted well, and showed no sign of having been recently opened, though at one point there were fairly new scratches in the thick rust. The ground round about was hard, and smooth flints had been used to metal it. On examining the man-hole carefully—for the moonlight was good—I noticed that in spaces between the cover and the frame there was no trace of dust or sand—a surprising circumstance in view of the strong breeze we had had in the early part of the day.

'The usual lifter holes were clogged up with mud and rust, and only a steel chisel-edged bar could have been inserted in the small chink between the plate and the frame. For the moment we were at a loss. It was now one o'clock, and unless the T.M. ammunition-dump was removed before 9 A.M., or the people in the vicinity warned, a disaster would take place at that hour.

'The sergeant suggested that the pumping-station close by might have some tools useful for opening the man-hole, and in leaning over to whisper this suggestion he accidentally put his weight on the side of the man-hole on which we had noticed the scratches. The lid lifted, and his foot disappeared with a scraping noise as the heel slipped over the rusty metal. Immediately he uttered a stifled cry of pain as the lid swung half-way back, imprisoning the ankle. I jumped forward and brought the lid into a vertical position once more, and he pulled out his leg, fortunately not much the worse for the accident.

'No sound showed that we had disturbed our spy, and together we peered down the man-hole. Leaning over, the sergeant felt the brick sides with his hands, and in a few seconds whispered that he had discovered iron rungs set in the brick-work. We descended, I lowering the lid of the man-hole with my head as I got down. The depth was about ten feet, and we found ourselves in black darkness in a space that barely left room for movement.'

III.

'My electric torch has red and green tints for the lens, and slipping in the red one, I switched the lamp on, thus getting a dim but sufficient light. On one side at the bottom the bricks had been removed, and a tunnel about two and a half feet square could be seen. It had been dug through the shale and ingeniously revetted with iron-wire grills (from the windows of the wrecked offices of the pit, we afterwards discovered), supported by trolley rails and odds and ends of iron-work picked up about the place.

'We had cautiously wormed our way along this tunnel a distance of about eight yards, when rays of light appeared filtering through the joints of a square wooden door just above my head. We listened, and hearing no sound, I gently applied pressure to various parts of the door till it yielded and lifted slightly.

'The man we had seen through the chink was still dozing as we had left him. I slowly lifted the door and raised myself to my feet. As I did so a sound caused by the door's having slipped from my hand awoke the German, and he turned suddenly. I recognised him immediately. It was Über-Leutnant von Hilsener, our friend's nephew, who escaped, you remember, when we laid the old boy by the heels.

'His hand flew to his pocket as I said, "Von Hilsener, you are twice covered. Even if you killed me, you would die in the same instant." He was a brave man, this German, and I verily believe that, had he not known me before, he would have died there and then fighting. As it was, curiosity, so strong in men of his profession, made him risk having to face a firing-squad afterwards, in order to talk with me. He whipped his hand from his pocket empty, and stood regarding us (for the sergeant had now appeared through the trap) with that haughty look the well-bred German officer so well knows how to affect.

"You will move to the far side of the dug-out," I said, "and make no attempt to destroy your apparatus; otherwise, I regret to say, I shall have to employ drastic means of keeping you out of further mischief." Von Hilsener bowed, and moved in the direction indicated. "Now, listen," I went on. "If you will agree to do all I suggest to you, I will use all my influence to save you from a fate which it is unnecessary for me to name to one so well versed in military routine as yourself. We have met before, and I admire your courage as I had reason to fear your resource. You will call up your friends over the line and tell them, in reference to the message you last sent, that the map reference was inaccurate, and you will give them one which my friend will provide. When you have done so I shall hand you over to the proper authorities, and tell them such details regarding yourself as will ensure your avoiding a disgraceful death. Do you agree?"

'Von Hilsener glanced towards the apparatus

above the table and looked me full in the face. "On one condition," he said: "that you tell me of my uncle's fate."

"Your uncle is well; I cannot say more. Do you agree to my conditions?"

"*Donnerwetter!* ja, I suppose I must," growled Von Hilsener.

"Go and fetch Lieutenant Jessop, sergeant," I said, watching my prisoner carefully.'

IV.

"Hello, Jessop!" I cried when he came in; "just look up that piece of waste-land near the brick-stacks on the map there. Got it? Right-o. What does it read?"

"C4. D.2.5," he returned.

"Right.—Von Hilsener, will you please call up and correct the reference you gave?"

"I cannot call up till two o'clock, when they will be looking out," he replied; "it is still ten minutes to two."

"Very good; tell us about the system," I said, wetting the end of my finger and touching the surface of a lens which was lying near the plush-lined case.

"They are not rock-salt, or how do you English call it?" he said. "You will see that our chemists and opticians have much further advanced than yours."

"Ours will soon discover what they are," said Jessop, the collector of information.

"Didn't you try concave polished reflections in the quest?" I asked, remembering our experiments.

"Yes; but our method is the best," said the German with pride. "You will not easily discover the secret composition of our lenses, as you have never equalled Jena glass."

"It is two o'clock," said Jessop.

'Von Hilsener moved towards the key, and I signed to the sergeant to write. The spy pressed the key in a succession of "dashes," and waited. A needle on a white dial quivered, then moved from side to side. Von Hilsener touched a switch, and then put an ear-piece to his ear with a metal clip. A low musical buzz filled the dug-out, and when the needle moved it became more pronounced. The German handed me the ear-piece, and putting it to my ear, I heard the Morse signals clearly cut from the continuous buzzing. He resumed the ear-piece and began to work the key, the apparatus clicking to each movement of his hand. When he had finished the sergeant read out the message, which, translated, became: "Reference last message alter map reference to C4. D.2.5. AAA. nothing adieu." Von Hilsener bowed, and signified that he was ready to follow me.

"You had better bring your rifle and Tommy's kit," I said. "Leave anything you choose with Lieutenant Jessop for his collection of curios;" and I looked at him warningly.

'He smiled his thanks, and threw a decoration

from his vest on the table, together with a bundle of papers in a leather roll.'

V.

'At nine o'clock the Boche artillery began an hour's shelling with shells up to eight inches on C4. D.2.5, and the expert in charge of the late radio-station of Von Hilsener heard what they said about it afterwards.

'The apparatus was similar to the one we had worked on, except that in place of our concave mirrors the lenses were of some compound which would not cut off heat-rays as glass does. They are being investigated. Electro-magnets moved the shutter, and the thermopile had an ingenious amplifying device which gave "buzzer signals." The spy had lived several months in our lines, posing as a signal service linesman and drawing our rations.

'He got his news by personal observation, and

by chatting with working-parties or overhearing scraps of conversation. He did not appear too often in the trenches, and used times when reliefs or bad weather would help to prevent his being stopped and questioned.

'A man of great personal courage, he probably came into our lines at night with one of our working-parties from "No Man's Land," disguised as a British Tommy, with his small apparatus concealed in his pack, having first given his friends the time and the place to pick up his first message. Having once established communication, he had made himself comfortable in a dug-out; and as his cells became exhausted he had obtained new ones from some of our linesmen, or taken them from a station telephone, leaving exhausted ones in place of those stolen whilst the operator was not looking. He was not shot, and, I believe, like his uncle, he is still well—and safe.'

ARCTICA.

IT was evening when we left Tromsø. For days we had sailed up Norway's fjords, basking on deck in glorious sunshine, and enjoying the beauties, the wonders, and the novelties of a foreign land. Two days had we spent in that quaint little capital of the north—Tromsø—days filled with memories of curiously painted wooden houses, of the lingering smell of drying fish, and of the stalwart race of vikings who, fighting year by year against rugged nature, win a competence and are content. The last boatload of provisions from the shore had been stowed away, smoke was belching from the funnels, and the hiss of steam somewhere seemed to suggest that the engines were straining at their iron leashes. A bell jangled on the bridge, a flag fluttered, and we were off once more. The yellow evening sun lit up the fjord, and a faint offshore breeze, stirring the pine-clad slopes, brought to us the sweet scent of the trees, the last we should see for some time. The warm sunny days seemed lost to us, and the sharpening evening wind whispered of the chill seas beyond.

The morning found us threshing our way through a heavy swell in the Arctic Ocean. Around, as far as eye could see, stretched a waste of sullen heaving waters, gray as the banked clouds above, which shut out the sun from that desolate sea for three whole days. Save once, no other ship appeared, and then it was a small sealing-schooner with a heavy list that scudded past, a solitary figure in dripping oilskins waving an arm in salutation to the big gray vessel, whose errand so far north must have puzzled him not a little. Colder and colder it became, and soon white patches could be seen here and there on the

waters—bergs over which an occasional roller burst into showers of spray. Once or twice, too, there was a swirl of a big body, a momentary glimpse of a curving tail, and a whale would disappear in the depths. Hitherto the water had been green, but a change was noticed, and that colour gave place to a deep blue; we were out of Arctic waters and had entered the Gulf Stream. Although it had come from our home shores it did not befriend us, for before long a thick fog enveloped the ship, and gray sky and bleak sea were lost from sight. Around us only a small patch of oily water could be seen, and with engines running slowly we pushed on into the unknown.

The third day out the fog lifted a little, and away on the starboard bow we saw a pale-yellow patch of light on the sky. To the greenhorn this conveyed nothing, but there was a commotion on the bridge, and telescopes and binoculars were directed towards it. There was a consultation and comparing of notes, and our Norwegian pilot, generally taciturn for lack of English, made the curt remark, 'Land is.' It was the famous 'ice-blink' that denotes the presence of land, and right ahead of us was the mainland of Spitzbergen. Soon we were abreast of this most mysterious land of the Far North, and for hours we sailed up the western coast, passing huge frowning peaks, mostly snow-clad, but in many places showing scarred black rock faces. Great corries were there, giant bowls filled with snow, whose whiteness in the sunlight was almost blinding. Overflowing from the lips of the corries and sweeping down from the mountains behind we could see rivers of ice—some a few yards across, others with a width of many miles. No two glaciers seemed alike: some

ended inland, others reached the sea; this one had a smooth surface, while that was riven and crevassed in all directions. Over all there rested an eerie silence broken only by the beat of the waves along the shore.

There is an atmosphere of mystery over the Spitsbergen Archipelago, assigned the other day to Norway by the Powers. The scenery is magnificent, but it is utterly desolate. There are no real inhabitants—the only people there being new-comers, anxious to exploit the valuables these shores conceal. In some parts there are reindeer and Arctic foxes; in others not even a bird relieves the deadly stillness. It is like a land whose people have been swept suddenly out of existence, except that hardly a trace of early occupation can be found. A few hunters and trappers have explored some parts for their own purposes, and many whalers make use of the great sheltered bays and harbours, but otherwise the islands seem to have lain forgotten through the past ages. Of the hardy Norsemen, the viking longships, and the men of the northern sagas but few traces can be found. Possibly the certainty of loot and plunder drew them rather to the south, to our own shores. Nevertheless, their early chroniclers mention a land, which they call Svalbard, which is probably Spitsbergen. It seems utterly impossible that these hardy navigators could overlook the great islands which lie so comparatively near their homeland, while penetrating to Greenland and America. Little record is left, however, and the actual exploration of this Arctic land was left until fairly late in history. While the rest of the world map was sectioned off and coloured according to ownership, this patch remained a No Man's Land.

Two grim mountains guard the entrance to Ice Fjord, and between them we sailed into that wide waterway which reaches right into the heart of Spitsbergen. The sheltered water gleamed deep blue in the sunshine, save where a berg, cast adrift from its parent glacier, glided past like a castle of marble, fantastically decorated with towers and turrets. Many seals disport themselves in the fjord, and every little while an inquisitive head pops up to view, with keenest interest, the passing of our ship. Once, too, we nearly ran down a large Arctic gull which was asleep on the surface, and which was roused by the cry of its more alert partner. The shores were less barren there, and luxuriant moss with coloured saxifrage relieved the monotony of the rock-strewn beaches. Behind rose the mountains, looking weird with their horizontal strata; while bands of white gypsum at intervals on the hill-faces gave an air of ornamentation to the gray slopes. Above, glistening and inviting, lay the everlasting snows.

Ashore, we found fulmar petrels and eider-ducks by the hundred, while often a baby tern would scuttle past with the jerky motion of a

clockwork toy. Being quite wild, the birds showed little fear of strangers, and the little snow-bunting hopped about our feet with all the abandon of a farmyard chicken. Their nests lay in among the mosses, which grow in rather an odd fashion. The ground, probably by influence of the frost, cracks into five-sided or six-sided figures, and it is in these cracks that the moss grows, so that, from above, the appearance is not unlike that of a garden with boxwood borders.

Although we were within about twelve degrees of the Pole, the cold was by no means intense. The sun shone on steadily, and lit the islands by night as well as by day. The only difference to us was that the brightness of the sun's glare at home gave place to a yellowness very much like that of a summer sunset, owing to the very low angle which the sun makes with the horizon in high latitudes. At first it seemed curious to waken up in the middle of the night and find the sun blazing down on the roof of the tent, but the novelty soon wore off.

After exploring a while in these new fields, we sailed to visit our Norwegian friends, who have opened up their Spitsbergen estates and founded a thriving settlement. We passed up a lovely fjord, unspoiled in any way, and rounding a green headland, came upon Longyear City. Here was a large jetty with hoists for coaling ships. Trucks clattered down the hillside, rumbled along the jetty, and were drawn up a slope at the extreme end, where two huge iron funnels directed the stream of coal on to the vessel below. A cluster of wooden buildings marked the settlement, and the unclaimed ground between the houses formed the main (and only) street. An overhead cableway was carrying coal from the mines to the bing, and a network of telephone-wires, with a wireless station in the distance, showed that the engineers and the managers were in no way behindhand—except, perhaps, in the matter of road-building. The coal was being dug out of a hillside seven hundred feet above sea-level, where the temperature in the workings is so low that roof and floor are frozen hard and are shining with ice. Machinery and mining-plant could be seen everywhere, and an atmosphere of hustle surrounded the whole place. Indeed, our engineer guide excused the nature of the road on the plea that they had no time for luxuries. Although there are only some four months in the year when Spitsbergen is approachable, the commercial possibilities of the land have been amply demonstrated.

And what of the future? Estates are being staked out; plans are being set afoot to open up the country. Soon, no doubt, some parts at least will yield up their charm and their aloofness. Civilisation and commerce, hand-in-hand, are advancing over virgin soil, and although progress is our watchword, some of us will regret the coming of the period of the enterprise of man, involving as it does the passing of the period of the grandeur of unsullied nature.

SEVENTH SERIES

FAIR EXCHANGE.

By HILTON BROWN.

I.

IF you desire to impugn the veracity of this tale, or to criticise, or to ask obvious and unnecessary questions, I must refer you to my friend Mr Andrew M'Caskie, chief engineer of the Coromandel Company's six-thousand-ton freighter, the *Thousand Lights*. I had the story from M'Caskie, and as I received it so I pass it on; but beyond that I take no responsibility. M'Caskie has an imagination, and it is within the bounds of possibility that the whole story was put into his mind by the sight of the *Ben Rinnes* lying over against us in the harbour of Madras.

He told me the tale as we sat upon the fore-hatch of the *Thousand Lights* and drank much better whisky than was at that same time procurable on the mainland. The *Thousand Lights* is one of the Coromandel Company's newer boats, with a cruiser-built stern, so that when she is loaded up and sits down in the water up to the neighbourhood of her Plimsoll marks, one end of her is exactly like the other. She carried a couple of paravanes forward, and there was a palpable scar where she had been fitted with a decent funnel in place of the deck-high affair she used during the war. Here and there you could still catch the outlines of her camouflage painting, and it was the first voyage, M'Caskie said, she had unshipped her gun. I remarked that it would be long before any of us would be able to look without a shudder on such grim mementoes of the worst four years our merchant service ever went through; and gazing round the quiet harbour of Madras, with the banks and the High Court buildings cutting up into a champagne-coloured afterglow, I added that it was a great thing to think there was peace upon the waters once more. M'Caskie looked sceptical.

'Men go down to the sea in ships,' said he absently; 'and so long as that continues to be the way o't, there'll be little peace on the waters. Man, it's a queer thing how the mind o' man turns jist natural-like to evil.'

He lit his pipe for the twentieth time and surveyed the placid waters of the harbour.

'Ye see that Ben Line boat lying over there?' said he. 'Yon's the *Ben Rinnes*. Phemison's her skipper—a decent, well-doin' body. But I

No. 490.—VOL. X.

never see a Ben Liner without thinkin' o' Patagonia Pringle an' his deeds.'

'Why "Patagonia"?' I asked.

'This lad Pringle,' said M'Caskie, 'had started out as an engineer o' sorts on South American railways. And whenever he got a dram inside him he wud sit and lay down by the hour about thae parts. All about Punta Arenas and Gallegos and sic-like places, which would seem to be poor kind o' spots for a lad o' spirit by his account o' them, and all about hunting guanaco an' a wheen other uncocs. As a natural result o' all this folk called him Patagonia Pringle, an' by that name ye'll find him recognised to this day in any port between Batavia and Suez, an' maybe beyond. Man'—M'Caskie swung round on me with the fire of the incorrigible raconteur in his eye—'did ever ye hear o' his latest ploy, him an' the *Ben-a-Bhuird*, o' which boat he's skipper at the moment o' speakin'—if he isna in the Glasgow jail?'

It was a drowsy evening, with a light breeze from the nor'-nor'-east, just enough to lend spirit to the evolutions of a neat little water-wag coming in through the harbour entrance. M'Caskie has the sort of voice that sends children to sleep like a woman's. It was a good two hours till dinner-time. I set my back against a coiled hawser and surrendered myself to the spell.

II.

'This lad Pringle,' proceeded M'Caskie, 'was taken on by the Ben Line on account of his having an uncle or some sic-like body in their London office. I mind fine the day I first met him. Third officer on the *Ben Vrackie* he was then, an' I do declare it was in this very same port. Sirs, he was an impident smatchet, too. A well-set-up lad he was, wi' black hair an' gray eyes, an' he looked at his betters as much as to say, "Whatna orra-like character's this?" A fearless, impident monkey. I've met an' forgathered with him any time off and on these twelve or thirteen year, an' I last set eyes on him no' six weeks back, jist after the conclusion o' this affair I am speakin' o', an', upon my word, there was little change to be seen in him one way or another. As for the natural and inborn wickedness o' the man, that'll never change till the crack o' judgment. Time an'

APRIL 17, 1920.

time again have I said to him, "Mend your ways, Patagonia, or ye'll come to grief yet," and all the reply I wud get wud be an ill name. Still, I ken he set more weight on my words than he was wont to do wi' most. "Ye auld wife, M'Caskie," he wud say, "they'll need to rise gey and early to keep upsides wi' me;" and that was the sober truth. For an auld wife o' an engineer that's spent most o' his days an' nights with his nose in a cylinder-head, I flatter myself I'm as ill to beat as most; but Patagonia—man, he was altogether by-ordinar'.

'You're wandering, M'Caskie,' I told him.

He roared for the steward, and had our glasses replenished. 'It wasna so much that,' said he, 'as that I was ettlin' at a starting-point. It's ill tellin' where to begin.'

He struck another match and let it burn out while he pondered.

'Ye know the port o' Bahoa?' said he at last. (Bahoa was not the name he used, but for reasons which will emerge it is the name I choose to employ. The real name would be as familiar to you as Colombo or Chittagong.)

'By name only,' I replied.

'That'll suffice,' said M'Caskie. 'Maybe thirty miles north-west of Bahoa there's a bit rock—it's little more—they call Kimbi, an' I was thinkin' I might do worse than begin with the night that Sandy Skinner stuck the old *Amethyst* o' the Jewel Line fair an' truly on the south end o' that same island. How he contrived to do so Providence alone can tell—maybe it was a judgment on him for packing thirteen hundred rubber coolies on to a boat that was never designed for more than eight. Be that as may be, there she sat on the southernmost rock o' Kimbi, with the saloon passengers raisin' the de'il's despair o' a commotion, and there she was sendin' up all kind o' signals when Pringle came along wi' the *Ben-a-Bhuird*. There was a bit o' a sea running, so Pringle stood by off an' on till it cam' light, and then he took off the passengers and put back with them into Bahoa—an' a fine shipload of it he had. Says Pringle to Skinner, "Have ye any casualties?" "God be here!" says Skinner; "what way can I tell ye? There's more coolies on board that ship than ever shipped on it, and by all ways o' lookin' at it this is a bad night's work for me. But I dinna think," says he, "there's anybody lost except the butler." This butler, I should tell ye, was a very black half-caste out o' Goa by the name of Antonio, and it was jist a matter of hours since Pringle had seen him with his own eyes doin' all manner o' clever aquatic feats in the Bahoa harbour. "That's odd, then," said Patagonia. "Yon fellie could swim like a fish. How did he come to be drowned?" "I dinna ken," said Skinner, "an' I dinna care." "Maybe he was drunk," said Patagonia. "Maybe so," said Skinner; an' they spoke no more about it.

'But for some reason or another the thing stuck

in the back o' Patagonia's mind, an' he worked round till he lit on one o' the *Amethyst's* crew that had seen Antonio go overboard. He learned from this chiel that Antonio was solemn-sober, that he tripped over a rope on the port side o' the ship an' went down into fairly still water. Big seas were breakin' over the starboard deck, but the ship, d'ye see, had made a sort o' harbour for herself on the port side. Anyway, souse in went Antonio—an' never came up! He hit nothing on the way down, for the ship had a big list to port; he jist went straight into the water an' sank like a stone. "That's no' natural," said Pringle; an' he went straight off an' sought out Gemmell, the port officer.

"See here, Gemmell," says he, "I want a loan o' two of your divers."

"Ye're welcome," says Gemmell. "For as long's this maunderin' devil Skinner's in the port limits, there'll be no work done by anybody. Take the whole staff," says he, "an', for Heaven's sake, take Skinner too." Patagonia didna take Skinner, but he took that man of the *Amethyst's* crew that had seen Antonio go overboard, and he put the *Ben-a-Bhuird* sharp about an' off back to Kimbi as hard as he could skelp. "When things are no' natural," he said to me afterwards, "ye'll find they generally pay to investigate." Ay, ay! Weel, he put his divers on board the *Amethyst*, an' over the side they went, an' it wasna many minutes when they had news o' Antonio. They put him in the bight o' a rope, an' he wasna well off the sea-bottom when the lads that was haulin' on the rope cried out that he weighed "half-a-ton." "That's no' natural again," says Patagonia. "Pull, boys; pull." The lads pulled on it till their shoulders cracked, an' in due course up came Antonio. Sirs, that man was wearin' three sets o' combinations, two shirts, an' three complete suits, with an odd waistcoat over an' above all, an' every single stitch o' every last garment o' these was sewn solid with—what d'ye think?

I shook my head.

'Sovereigns! Many good, honest British sovereigns, an' five-dollar pieces o' gold beside! Losh! the man was armoured wi' the solid gold like the carapace o' a crab!'

'I might have guessed it,' said I.

'Ye might—*now*,' said M'Caskie. 'It doesna need any superfluity o' business acumen for to realise that when ye can buy a sovereign in such an' such a country at anything from ten rupees to eleven-eight, an' sell that same in any given bazaar in the whole o' south India for eighteen rupees, then ye've got a commodity which, considerin' its weight an' bulk, will offer ye a very handsome profit. Always provided, that is, ye can pass it on shore without at the same time passin' yerself into the penitentiary! Ay, jist that. As I said a few minutes syne, the world's full o' wicked men, and two-thirds o' them follow the sea for a trade, an' they're no' the sort o'

lads to keep their hands off a proposition o' that nature. All that we ken fine to-day; you know, an' I know, that it's a thousand to nothing that the game's goin' on at this very moment in this same harbour of Madras. But I wud have ye to observe that at the time the *Amethyst* went ashore on Kimbi the exchange was jist beginning to rise; an' the thing was still almost in the nature of a gamble. For aught I wud jalouse to the contrar', Antonio may have been the pioneer o' the trade—in which case he's showed the road to a sight o' better men than himsel'. Be that as may be, it was an eye-opener for Patagonia. "I've a grand nose for money," said he, "an' fine I knew this wud pay for our trouble. When things turn out no' natural, *always* investigate. An' there's that fushionless auld tup Skinner wud ha' gone on to the end o' his days doin' no more than ship a wheen deck-passengers that never took a ticket! Gie that chap a decent funeral," says he (meaning, of course, Antonio), "for he's been a friend to me an' mine. God-sake," says he, "I'll retire on him yet!"

III.

M'Caskie paused, and I am afraid the steward went to work again. Another match was struck and allowed to flicker aimlessly away. Suddenly across the still harbour from the *Ben Rinnes* came the rattle of a bell, whereat M'Caskie pulled out a solid-looking watch and surveyed it.

'Seven to the tick,' said he appreciatively. 'Ye can aye set your watch by a Ben Liner's dinner-bell. An' it's no' so many weeks syne that I was stepping down the east quay o' Bahoa harbour and heard the *Ben-a-Bhuird's* bell give jist that same clatter, and ran into Patagonia himself on the way back to his ship. Ay, ay! Head in the air he went, as cool and as canty as ye like—though I'll wager he was the best-watched man in Bahoa that night.

"Give ye good-even, Mac," says he; "will ye step on board for a snack?"

'I looked him up an' down. "I think I'll no' the night," I says. "I'm feared I might see that which I had better not."

"Ye'll have good sight, then," said he. "Three times in two days have the port police been over this ship, once when I was there and twice when I wasn't, and you can take it from me that they scraped her from keel to masthead and from bow to propeller. An' what did they find?" says he. "Devil a thing but what's down in the invoices. It's hard," says he, cocking his impudent head, "that an honest man's to be denummed like this."

"Very like," says I; "but, anyway, I'll be stepping."

'Weel, I don't suppose I was many yards down the quay when I came upon Quint, who was deputy commissioner o' the Bahoa port police—an' a sharp lad, too. Ay, he was that. He had hold o' me before I could pass him, an' fine I knew

what he was after. But Quint was an Englishman, an' so he must needs be beating all round and about the bush as if a blind bairn couldna see the purpose behind it all as plain's a barracouta above sandy bottom on a sunny day. He wrought this way an' that, an' syne out it came.

"See here, M'Caskie," says he, "you're an old friend. Can ye no' give us a hand here?"

"I'm at a loss to understand yer meaning," says I.

"Man," he cried, fair screechin' wi's temper, "I can *smell* that gold within yards o' me. I have my hand almost on it. I know that damned fellow's got the best part o' a hundred thousand pounds in gold on board that boat somewhere; I know where he got it from, an' I know where he wants to put it off—where he *must* put it off—an' that's here, and no other place. But where *is* it?" he cries. "Where *is* it?"

"What way do ye no' search the ship?" I asked him.

'He girmed in my face. "As if ye didna ken fine," says he, "that I've been over that ship wi' my best men time after time. But," cries he, fair yammerin' wi' rage, "can I open every case in the hold? Can I tap every bulkhead, or prise every locker on the boat? Can I tear the shirts off every blasted one of his officers and engineers and what not? No; without a warrant, that's what I can *not*. An' a warrant's jist what I canna get."

'Oh, sirs, he was fair dancin' wi' fury.

"Ye're excitin' yersel', Quint," says I, "to no purpose. It stands to common reason that he canna get the stuff ashore under your eyes, and, as you say, get it ashore here he must. What can he do, then, but sink it alongside? Sweep after he's away."

'He up an' called me all the names in the book.

"Ye doited auld carline," says he, or words to that effect, "d'ye expect *me* to believe that o' *him*? Sink it alongside! Why, the head lascar's baby bairn wudna try foolishness o' that sort wi' *me* here. There ye stand jist takin' a loan o' me. For aught I ken, ye're in't yersel'. Sink it alongside! Damn the fear! He'll get it on shore, an' as like's not he'll get my own men to carry it off for him."

'I left him there stutтерin' an' swearin', an' I went for a stroll up the town. Comin' back, here's Patagonia himsel' strolling about in the shadow of the *Ben-a-Bhuird*—she was hard alongside—smokin' a cigar an' lookin' as if the place belonged to him. He had the brass, that lad; ay, he had that. If there was one police inspector on the quay, there was ten, an' I could hear launch callin' to launch all over the harbour like a flight o' duck.

"Ay, M'Caskie," says he, "an' how's a' wi' you?"

"It's like to be some close wi' *you*," I told him. "I presume this is by way o' a final fling,

an' ye'll retire from the job after it; but ca' canny meantime."

"Yon's a bonny wee brig ower there," says he. "She's the *Sarasvati*. She's owned by an Armenian—one Pieris. A scoundrel, they say he is, too."

"He'll no' be much worse than you," I says. "Man, Pringle, what under the heaven above us is the use o' draggin' bonny wee brigs in front o' me? I'm past chasin' red herrin' at my time o' life. I ken, an' you ken, that she's jist a dirty little scut o' a thing that was built for carryin' Burma rice when the Indian market was short, an' is now in the coastin' trade with teak. I wudna gie ye a couple o' lakhs for hull and cargo."

"Oh, I dinna ken," says he. "She's a decent wee briggie; an', anyway, M'Caskie, she's no' any sort o' a red herrin'. I jist wanted to draw her to your attention. Man, man," he cries so loud that I thought the nearest policeman must hear, "do ye think I'm daft? Ye auld dotterel, I couldna win off this ship wi' a Maundy-money bit, let alone a barrel or two o' sovereigns. D'ye think I dinna see't? Man, when I go on board that boat, there'll be one policeman lyin' in my bunk, an' another keekin' in at the port-hole. A scoundrel I may be, if ye say so, but I'm not a lunatic. I've done my business here, an' I'm off to-morrow."

"Patagonia," says I, as solemn as I could, "ye've got gold on that ship, and ye have not put it ashore yet. If ye tell me ye'll quit Bahoa with that stuff still on board, I'll tell you ye're a liar."

'He threw away the end o' his cigar.

"You prove your words," says he, "an' I'll prove mine."

IV.

'Weel, next mornin' I was jist sittin' down to a pickle ham-an'-eggs when I hears the *Ben-a-Bhuird's* siren shriekin' like a wild beast, an' here she comes slewin' round with two tugs pushin' her, headin' out of the harbour. I took my glasses, and in front of the port office I saw Quint an' Gemmell—him that Patagonia borrowed the divers off for Antonio—standin' cranin' their necks as if they didn't know what to make of it. More by token, I saw the cone hoisted for a cyclone, and already there was a bit o' weight in the seas coming in; but the *Ben-a-Bhuird* went out coalin' up as if for a race, and the freshening wind blew her smoke-screen all over the harbour. She went off full lick to the nor'-west, an' in a couple of hours' time she was no more than a smudge on the horizon.

'Weel, the cyclone blew up in the night all right—nothing to write home over, but a nasty blow for all that. It's well known that the man who designed Bahoa harbour was a congenital eediot, or else never meant it as a resting-place for ships, for it opens full into the teeth of the seas. The auld *Thousand Lights* here was like to leave her berth at one time, but we got

through the night as we've got through worse, an' in the forenoon I took a stroll down to the port office. There I fell in wi' Gemmell.

"M'Caskie," said he, "that fellow's got the luck o' the devil."

"What now?" says I. "Is he on to Kimbi?"

"Far from it," says he. "He wasna the length o' Kimbi when he picked up a derelict. Derelict, man, mark ye—none o' yer tows or salvages! Clean derelict! A well-found ship, an' about two lakhs' worth o' timber in the hold of her. It beats a'. He'll be in here with her this afternoon."

'I said jist what came into my mind—though how or why it came there Heaven alone knows.

"No' the *Sarasvati*?" I says.

"How did ye hear that?" says Gemmell.

'I minded mysel' in time. "It was jist a bit rumour," said I; "some one was mentionin' that name."

"I dinna understand how thae things get out," he snaps; and away he went into his office.

"Now," thought I to mysel', "what's next?"

'Weel, we werena long kept waitin'. Two had hardly chapped on the port-office clock when up goes the signal for a steamer sighted, and it wasna many minutes later when up went a flag I didna require my glasses to read—the red house-flag o' the Ben Line. "Here he comes!" thinks I. Losh me! but I was as excited as a bairnie at a circus. "What's next?" thought I; an' I slipped on my oilskins and went off to the quay. It was a dirty afternoon; the first blast and rain o' the cyclone had worn by, but there was a big ugly sea comin' slap over the wall, an' every cable and hawser in the harbour was strainin' an' groanin' like a chorus o' frogs in the paddy-fields. On the quay were Gemmell an' Quint an' a wheen more, all drooked as deuks. I jalouse the *Ben-a-Bhuird* would be about a mile out—maybe less—with the brig in tow.

"The luck o' the swine!" says Quint through his teeth. "He may have failed here, but no sooner's he out o' the place than a present of three or four thousand falls into his lap. I'd give the eyes out o' my head," says he, girning like a madman, "to take that from him. I'd give"—

'Slap across the middle o' his words comes a roar from Gemmell like a fog-horn. "Jehoshaphat!" he roars. "He's lost her. His hawser's broke. Lost her outside the port limits. Get the tugs out, boys, for the love o' glory, an' we'll take her from him yet!"

'Sirs, sirs, ye never saw such a collieshangie! Thae two tugs went out o' the harbour-mouth like deer, shipping the seas green at every yard; Gemmell was dancing about like the daft, an' Quint was tearin' the hair out o' his head and barkin' the skin off his hands wi' hammerin' them on the stone o' the wall. It was grand! "What next?" thought I. Meanwhile the *Ben-*

a-Bhuird had got the way off her and had slewed round a bit to port, but she was unhandy in the seaway out there, and the brig was fair slippin' away from her. Outside Bahoa harbour, as ye're perchance aware, the current sets strong to the south, an' the brig was away into this like a gull. "She'll beach!" roars Gemmell. "She'll break!" an' he fell to cursing the tugs something shameful. I never knew who were on the tugs, but bonnier work I never saw. They cudna have seen a dozen yards in front of them, what wi' the rain and the wind an' the green seas coming over them; but they contrived somehow to get up wi' that brig and get one on each side o' her, an' by means of a double hawser slung between them, or something o' that kind, they nursed her right into the surf, till at last in she came wi' a sweep an' sat nicely down on the sands wi' a comfortable dunt an' not a spar broken.

'I thought Gemmell and Quint had fair gone gyte; ye wud ha' said, to see's, we were one an' all far gone in liquor. I dare say I was near as bad myself as any o' them, for I was taken up with the work o' thae tugs, which was as nice as ever I saw, an', forby, I kept askin' mysel' the old question, "What's next?" Ye must remember I'd kent Patagonia intimate-like for a matter o' thirteen year, an' he was a man who was ready at any time for anything, an' any man less likely to lose the best part o' a lakh over a bad hawser, an' that with the tow practically safe home an' delivered, I could not put a name to. Moreover, I thought o' Patagonia's own words—"When things turn out no' natural, always investigate." Howsomever, I held my peace, it being, as I had said all along, no affair o' mine.'

V.

'I suppose Quint had the best part o' a hundred police skelpin' round that derelict inside o' twenty minutes, an' Gemmell would ha' drawn a cordon o' launches round outside o' her if he could have risked them in that sea. The tugs lay off jist to make matters sure, an' he also brought out a couple o' drifters. It was as good's a play.

'Meanwhile the old *Ben-a-Bhuird* looked fair taken aback; she had come in almost to the mouth o' the harbour, and then slewed round to the back o' the north quay, where ships rarely lie on account o' the pull o' the tide an' the current, an' there she lay with a dribble o' smoke coming out of her funnel. About five she signalled for the pilot's launch, and jist after dusk off came Patagonia with his witnesses and his credentials to put in his claim. I absented myself from the meeting, having been down to look at the brig, and there I had seen another thing "no' natural"—which same thing Gemmell must ha' seen if he hadna been blind drunk wi' self-conceit. Did ever ye see a derelict? Weel, I've seen a wheen o' them, but never saw I a

derelict that had been abandoned in sic good trim as this one.

"Losh me!" thought I; "it was surely a chicken-hearted company that abandoned you!"—and, indeed, she'd ha' floated for weeks. However, she'd been in native hands, so there was no saying; they lose their heads like.

'Patagonia stated that he had found her abandoned jist on this side of Kimbi, gave his latitude and longitude and so on and so forth. Then he wanted his claim to be recorded.

"No' so fast," said Gemmell. "You never brought that derelict in. So far as you're concerned, she'd be decoratin' the Indian Ocean at this moment. You lost her. She was salved here by the port authorities."

"Salved be sugared!" says Patagonia. "She's mine. She's the Ben Line's for a third of the value of hull and cargo, bein' a derelict, as I've said."

"Fair an' softly," says Gemmell. "There's a law for all these things. I don't pretend to be a lawyer, but that brig's now in the hands of the Receiver of Wrecks, and there she remains till the legal rights of the case are settled. Meanwhile, Captain Pringle, you can sling your hook, an' I don't think it'll be worth your while to come back for all you're likely to get out o' this."

"I've got my work to do," says Patagonia. "I can't hang off an' on here waiting for a parcel o' sea-lawyers. Let me tell you, Gemmell, the Ben Line's behind me; an', by the Lord, if you keep us waiting for the money, the board'll sue you for compound interest! What's compound interest on three lakhs, eh?"

'That frightened Gemmell a bit, they said, but Quint cut in. "Dinna be a fool," says he. "There's no court wud listen to any such suit for ten minutes. That wreck's with the Receiver—that's us—and we've got her, an' there she'll bide."

'Patagonia went white to the lips—but it's maybe as weel to bear in mind that that man could work his face like a handful o' putty.

"Oh, you've got her, have ye!" cries he. "Well, see if ye'll keep her." And then, they said, he sort o' bit his lip as if he'd let slip more than he meant, and marched away out o' the office an' back to the *Ben-a-Bhuird* without another word.

"I kenna why folk say that lad's so clever," says Gemmell. "I can see what his game is as weel's I can see you. He'll bring his boat down in the night and try to get the brig off. She's settin' pretty firm, but he might do't. Get out ilka tug an' dredger in the place, an' ship flares, an' play the searchlight on the *Ben-a-Bhuird* every ten minutes.—Quint, you an' me'll spend the night down by the wreck.—Keep her, lads—we'll keep her if he brings up the whole Gairman Navy wi' the *Emden*'s ghost at their head!"

M'Caskie tilted his tumbler and called the steward for the last time. "I'm no' wearyin' ye?" he asked.

'No,' I said. 'But I think I know what's coming.'

'Keep's a'!' exclaimed M'Caskie; 'by the time we'd gotten that length wi' the matter, so did I. But no' Gemmell an' Quint—no' by a long chalk. My! ye should ha' seen their faces when the next day broke an' there wasna a sign o' the *Ben-a-Bhuird* between Bahoa an' Borneo. Eh! but I laughed at them. Gemmell was that drunk and dozed wi' conceit that he wud still have believed that Patagonia had given it up an' slunk off in the ríght wi' his tail atween his legs, but Quint had more sense. "What!" says he; "Patagonia Pringle abandon a lakh or more for nothing? Not much! We've been done after all, an' if I lose my job it's what I deserve." "Lads," says I, "have ye but reflected that last night was the first night that ye havena been sittin' round the *Ben-a-Bhuird* like corbies round a deid heifer, an' that last night ye had no watch on her at all except a searchlight every ten minutes? Even that ye stopped an hour or two afore the light; an' what's a searchlight every ten minutes on a dark night with a heavy sea running and your ship the best part o' a mile away?" Eh, sirs, I thought they wud ha' struck me; yet it was elementary—ingenious, I grant ye, but elementary after all.'

'M'Caskie,' I said, 'you seem to me to know

a great deal about this. Tell me, *did* Captain Pringle get that gold ashore, or did he not?'

'It's beyond my power to say,' said M'Caskie suavely. 'But if he did not—we'll put it conditional-like—if he did not, then he left that derelict and his share in her, which was at least one lakh o' rupees, an' all for nothing; an' he left Bahoa full o' old scores which he hadna paid off, an' couldna. If ever there was anything "no' natural," it wud be sic-like things happenin' to Patagonia Pringle.'

'You're a canny Scot, M'Caskie,' I persisted, 'and it isn't my business, but you seem to me to know a thundering lot about this affair for a plain sea-going engineer. I hæ ma doots.'

'Ye're no' the only one,' said M'Caskie. 'It's a case of maybe ay an' maybe no. But there's just one thing,' he said, as I went over the side, 'that I've often wondered over, an' that is whether or not that lad Pieris ever got the money for his ship. As I've been told it, he made a hard bargain and got the money afore ever he parted wi' the ship; but if I ken Patagonia, he didna.'

'But Pieris could have blown the gaff,' I pointed out.

'No' very weel,' said M'Caskie, beaming amiably over the rail. 'Ye see, he was a dealer in sovereigns.'

ARCHÆOLOGY FROM THE AIR.

ONE generally associates archæology with the earth, and it may surprise you to know that ancient remains can be studied from an aeroplane. But this *is* so; for one of the most important aspects of the study of antiquities is the 'bird's-eye view' of an ancient site. Hitherto one has had to be content with maps and plans of such sites—which are, of course, only 'bird's-eye views' laboriously constructed on the ground. But now it is possible to take photos from a point in the air, vertically above a buried town. Photos so taken reveal startling facts which are hidden from the ground observer. It was in this way that the remains of the ancient city of Eski Baghdad, in Mesopotamia, were found. On the ground the city appeared only as a meaningless maze of low mounds and scrub. From above it was seen to be laid out in square blocks like an American town, with ornamental gardens on a large scale.

But there is a field nearer home awaiting an airman with an interest in such things. Every one who has flown in France during the war will remember the long, straight Roman road from Amiens to Vermand through Villers-Bretonneux, and what a fine landmark it was. Running absolutely straight for thirty-four miles, it could not be mistaken, and it has the additional advantage of running due east and west, so that

if in doubt one had only to fly west along it until one picked up a village that one knew. It probably saved many pilots from landing on the wrong side of the lines. This road crosses the Somme battlefield at its widest point, and is still in use as a main thoroughfare. Any one, therefore, can see it without difficulty. There are, however, other Roman roads in France and England which ran quite as straight, but which have now fallen into disuse. Their course is marked by a straight and continuous line of hedges and footpaths. Such roads are equally useful as landmarks, but they must be learnt before they can be so employed.

There is another Roman road which before the war was not much used, but whose course was approximately followed by a modern track—the road from Vermand (a Roman town) to Bapaume through Rocquigny. I had often seen this road on the map, and longed to investigate it more thoroughly; but it was on the wrong side of the lines at the time. An opportunity came when I was flying over it in March 1917, when the Germans were about to retreat to the Hindenburg Line. I was probably the last person ever to see that Roman road, for upon the day I flew over it the tide of battle was on the point of reaching it, and when I flew over it again in

1918 it was entirely submerged beneath a sea of shell-holes.

Another Roman road which I found a most useful landmark was that from Vermand to Bavai, which forms the north-western boundary of the great forest of Mormal, west of Maubeuge. This road degenerates south of Le Cateau into a mere cart-track, but the line of it is straight and clear, and one had only to pick it up at Mormal (which could always be seen) and follow it south until one could distinguish Vermand. That done, one could generally locate one's exact position; it was the work of only a moment to do all this. I have many a time used this Roman road to find points when photographing 'counter-battery areas.'

The Roman road from Cassel runs due south, and also forms an admirable landmark. Once, when flying over Armentières (a part of the line with which we were both unfamiliar), my pilot told me he was lost, and wished to be directed back to the aerodrome. We were on our way home, and I knew exactly where we were, as I had been following our course on the map. However, to save tedious directions, I told the pilot to fly due west, knowing we should strike this road before long, as, of course, we did. Then I bade him follow it southwards. He recognised its remarkable straightness (though it is not a first-class road), and could follow it until the hangars of Estrées-Blanches came into sight. This place, as the name shows (*estrées* = streets) was evidently a Roman station, and the crossing-place of several Roman roads. The road from Calais to Arras runs through it; the legions homeward bound from Britain must often have passed along it. It was the 'leave-route' of Roman Britain.

But not only can one thus follow the course of already known Roman roads; one can also spot fresh ones more easily from the air than in any other way. At Estrées-Blanches I found what

I believe to be a hitherto unknown Roman road approaching the village from the south-west. It was indicated by a succession of 'linchets' or cultivation terraces, all in the same alignment. I was unable to verify my observation by a reconnaissance on the ground; but from my experience of the behaviour of field-boundaries in England, I feel pretty sure that the inference was correct. When one sees a line of hedges running straight for some distance, at an angle to the rest and without any regard for the lie of the land, one will generally find that these hedges have been planted along the stony ridge of a Roman road. I have actually rediscovered the course of Roman roads in this way by studying the field-boundaries on the six-inch Ordnance map. In this country, thanks to the admirable large-scale Ordnance maps, one is more fortunately placed than in France, where before the war the 1:50,000 map was the largest scale map published of the whole country. But good as are the six-inch maps, naturally they do not show quite enough in this respect; for often the only trace of a Roman road which now survives is a broad belt of lighter-coloured earth across a ploughed field. It is difficult to detect this from the ground—one is too close to be able to see it standing out as such. But from the air it is quite easy. This belt is due, of course, to the fact that even after the raised causeway of the road has been spread out flat by centuries of cultivation, its constituent matter, mixed with the natural soil, invariably renders it lighter in colour—mainly owing to the presence of more stones and sandy grit in it.

Here is a fine opportunity for some enterprising airman to add to our knowledge of Roman Britain. There are other ways in which he might 'archæologise' in the air, both in this country and in the East; but that is another story.

THE PARTS MEN PLAY.

CHAPTER XIV.—*continued.*

III.

'THIS way, gentlemen,' said Smyth, leading them up an alley, across a court, and into a lane. 'Permit me to welcome you to Archibald's.'

They entered a dimly lit tavern, where a dozen or so men sat about the room at little tables. Instead of the usual pictures one sees in such places, pictures of dancers with expressive legs, and race-horses with expressive faces, the walls were hung with dusty signed portraits of authors, artists, and actors, most of whom had attained distinction during the previous half-century. Sir Henry Irving as Othello held the place of honour over the bar,

with Garrick as his *vis-à-vis* on the opposite wall. The divine Sarah cast the spell of her eternal youth on all who gathered there; and Lewis Waller, with eyes intent on his sword-handle, seemed oblivious to the close proximity of Lily Langtry and Ellen Terry, those empresses of the dual realms of Beauty and Intelligence. Without any companion portrait, the puffy sensuality of Oscar Wilde held a prominent place. And between the spectacled face of Rudyard Kipling on one side and the author of *Peter Pan* on the other, Forbes-Robertson in the garb of the Melancholy Dane looked out with his fine nobility of countenance. The room was heavy with tobacco-smoke, which seemed to have been accumulating for years, and to have darkened

the very beams of the ceiling. Over the floor a liberal coating of sawdust was sprinkled.

'Strange place, this,' whispered Johnston Smyth as they took a table in an unfrequented corner. 'It's an understood thing that the habitués of Archibald's are trailers in the race of life. If you have a fancy for human nature, gentlemen, this is the shop to come to. We've got some queer goods on the shelves—newspaper men with no newspapers to write for; authors that think out new plots every night and forget 'em by morning; playwrights that couldn't afford the pit in the Old Vic.—Do you see that old chap over there?'

'The little man,' said Selwyn, 'with the strange smile?'

'That's right. He's been writing a play now for twenty years, but hasn't had time to finish the last act. "There's no hurry," he says; "true art will not permit of haste"—and the joke of it is that he has a cough that'll give him his own curtain long before he ever writes it on his play. There he goes now.'

The old playwright had been seized with a paroxysm of coughing that took his meagre storehouse of breath. Weakly striking at his breast, he shook and quivered in the clutch of the thing, leaning back exhausted when it had passed, but never once losing the odd, whimsical smile.

'What about something to drink?' broke in Dick Durwent hurriedly, his eyes narrowing.

'Directly,' said Smyth, beckoning to the proprietor, a small man, who, in spite of his years and an oblong head undecorated by a single hair, appeared strangely fresh and unworried, as if he had been sleeping for fifty years in a cellar, and had just come up to view the attending changes.

'Archibald,' said Smyth, 'these are my friends the Duke of Arkansas and Sir Plumtree Crabapple.'

The extraordinary little man smiled toothlessly and fingered his tray.

'Gentlemen,' said Smyth, 'name your brands.'

'Give me a double brandy,' said Durwent, blowing on his chilled fingers. 'Better make it two doubles in a large glass.'

'Soda, sir?' queried the proprietor in a high-pitched, tranquil voice.

'No,' said Durwent. 'You can bring a little water in a separate glass.'

'What is your pleasure, your Grace?' said Smyth, addressing the American. 'If you will do Archibald and myself the honour of trying the Twilight Tinkle, it would be an event of importance to us both.'

'Anything at all,' said Selwyn, sick at heart as he saw the nervous interlocked fingers of Dick Durwent pressed together with such intensity that they were left white and bloodless.

'This is a little slice of London's life,' said Smyth after he had given the order, crossing his

left leg over the right, 'that you visitors would never find. You hear about the chaps who succeed and those who come a cropper, but these are the poor beggars who never had a chance to do either. There's genius in this room, gentlemen, but it's genius that started swimming up-stream with a millstone round its neck.'

With a profound shaking of the head, Smyth straightened his left leg, and after carefully taking in its shape with partially closed eyes, he replaced it on its fellow.

'How do they live?' queried Selwyn.

'Scavengers,' said Smyth laconically. 'Scavengers to success. Do you see that fellow there with the poached eyes and a four-days' beard?'

Selwyn looked to the spot indicated by Smyth, and saw a heavily built man with a pale, dissipated face, who was fingering an empty glass and leering cynically with some odd trend of thought. It was a face that gripped the attention, for written on it was talent—immense talent. It was a face that openly told its tale of massive, misdirected power of mentality, fuddled but not destroyed by alcohol.

'That's Laurence De Foe,' said Smyth; 'a queer case altogether. Barnardo boy—doesn't know who his parents were, but claims direct descent from Charlemagne. He's never really drunk, but no one ever saw him sober. If he wanted to, he could write better than any man in London. Last year, when the critics scored Welland's play *Salvage* for its rotten climax, the author himself came to De Foe. All night they sat in his stuffy room, and when Welland went away he had a play that made his name for ever. I could tell you of two of the heavy artillery among the London leader-writers who always bring their big stuff to De Foe before they fire it. Last July, when the war was making its preliminary bow, and Hemphill was thundering those editorials of his that warned the Old Lion he would have to wake up and clean the jungle—Hemphill was simply the errand urchin. There's the man who wrote "To Arms, England!" one day after the Austrian note to Serbia. Hemphill got the credit and the money—but Laurence De Foe did it.'

Smyth's stream of narrative, which carried considerably less impedimenta of caricature and persiflage than was usual with him, came to an end with the arrival of two Twilight Tinkles and a generous-sized tumbler, more than half-full of brandy. After an elaborate search of his coat and trouser pockets to locate a five-pound note, Smyth was forced to allow Selwyn to pay for the refreshment, promising to knock him up before six next morning and repay him.

'Well, gentlemen,' said the conscientious artist, 'here's success to crime!'

Not waiting to honour the misanthropic toast, Dick Durwent had reached greedily for his glass, and poured its contents down his throat. With a heavy sigh of gratification, he leaned back in

his chair, and the pallor of his cheeks showing beneath the weather-beaten surface of tan was flecked with patches of colour. For an instant only his eyes went yellow, as on the night at the Café Rouge; but the horrible glare died out, and was succeeded by the calm, blue tranquillity that had reigned before.

'By St George!' said Smyth admiringly, 'but we have no amateur with us, Selwyn.'

The solitary figure of De Foe, who had been watching them, left his table, and lurching over to them, stood swaying unevenly.

'*Bon soir*, gentlemen,' he said, speaking with the deep sonorousness which comes of long saturation of the vocal cords with undiluted spirits. 'I think one or two of these faces are new to Archibald's. Am I right?'

'Yes, sir,' said Smyth, rising. 'Permit me, Mr De Foe, to introduce'—

The writer stopped him with a slow, majestic movement of the hand. 'What care I who they are?' he said heavily. 'Names mean nothing—pretty labels on empty vessels. By what right do these gentlemen invade the sanctity of Archibald's?' He drew a chair near them and sat down sullenly, hanging his arm over the back. 'Do I see aright?' he queried thickly, opening his eyes with difficulty, and revealing their lustreless shade. 'There are three of you? Humph! The one I know—a clumsy dauber in a smudgy world.'

Smyth nodded delightedly to his companions to indicate that the compliment was intended for him.

'Of your friends,' went on the heavy resonant voice, 'one has the face of a dreamer. Come, sir, tell me of these dreams that are keeping you awake of nights. I am descended from Joseph by the line of Charlemagne, and I have it in my power to interpret them. Are you a writer?'

'I am,' said Selwyn calmly.

'You are not English. You haven't the leathery composure of our race.'

'I am an American.'

'I thought as much. You show the smug complacency of your nation. How dare you write, sir? What do you know of life?'

'We have learned something on that subject,' said Selwyn with a slight smile, 'even over there. You see, we have the mistakes of your older countries by which we can profit.'

'Bah!' said the other contemptuously. 'Cant—platitudes—words! Since when have either nations or individuals learned from the mistakes of others? Take you three. Which of you lies closest to life? Which of you has drunk experience to the dregs? The dauber?—You, author-dreamer, fired by the passion of a robin for a cherry?—No, neither of you. . . . That boy there—that youngster with the blue eyes of a girl; he is the one to teach—not you. He has the stamp of failure on him. Welcome, sir—the Prince of Failures welcomes you to Archibald's.'

He lurching forward and extended an unsteady hand to Dick Durwent, who rose slowly from his chair to take it. As Selwyn watched the two men standing with clasped hands over the table, he felt his heart-strings contract with pain.

Although separated by more than thirty years, there was a cruel similarity in the pair. In the half-bravado, half-timorous poise of the head; in the droop of sensuous lips; in the dark hair of each, matted over pallid foreheads. . . . It was as if De Foe had summoned some black art to show the future held in the lap of the gods for the youngest Durwent.

'My boy,' said De Foe drunkenly, but with a moving tenderness, 'life has refused me much, but it has left me the power to read a man's soul in his eyes. The world brands you as a beaten man—and by men's standards it is right. But Laurence De Foe can read beyond those sea-blue eyes of yours; he it is who knows that behind them lies the gallant soul of a gallant gentleman. End your days in a gutter or on the gibbet—what matters it where the actor sleeps when the drama is done?—but to-night you have done great honour to the Prince of Failures by letting him grasp your hand.'

He slowly released the young man's hand, and turned wearily away as Durwent sank into his chair, his eyes staring into filmy space. Moving clumsily across the room, De Foe reached the bar and ordered a drink. When it had been poured out for him he turned about, and, leaning back lazily, looked around the room, with his eyes almost hidden by the close contraction of thick, black eyelashes. Such was the unique power of his personality that the disjointed threads of conversation at the various tables wound to a single end as if by a signal.

'*Mes amis*,' said De Foe—and his voice was low and sonorous—'I see before me many, like myself, who have left behind them futures where other men left only pasts. I see before me many, like myself, who had the gift of creating exquisite, soul-stirring works of art and literature. . . . But because we were not content to be mere mouthy clowns, with pen or brush, jabbering about the play of life, we have paid the penalty for thinking we could be both subject and painter, author and actor. Because we chose to live, we have failed. . . . The world goes on applauding its successful charlatans, its puny-visioned authors pouring their thoughts of sawdust in the reeking trough of popularity; while we, who know the taste of every bitter herb in all experience—we are thrust aside as failures. . . . But the gift of prophecy is on me to-night. There is a youth here who has a soul capable of scaling heights where none of us could follow—and a soul that could sink to depths that few of us have known. He is one of us, and he has chosen to fight for England. I can see the glory of his death written in his eyes. Gentlemen—

you who are adrift with uncharted destinies—drink to the boy of the sea-blue eyes. May he die worthy of himself and of us.'

Throughout the dimly lit room every one rose to his feet, incoherently echoing the last words of the speaker. . . . Still with the filmy wistfulness about his eyes and a tired, weary smile, Dick Durwent sat in his chair beating a listless tattoo on the table with his hand.

From across the room came the sound of the old playwright's hacking cough.

CHAPTER XV.—DICK DURWENT.

I.

LATE that night Selwyn lay in his bed and listened to the softened tones of his two guests conversing in the living-room, Johnston Smyth having conceived such an attachment to his newly found friend that it was quite impossible to persuade him to leave. At his own request, blankets had been spread for Durwent on the floor, and after a hot bath he had rolled up for the night close to the fire. Johnston Smyth had also disdained the offer of a bed and ensconced himself on the couch, where he lay on his back and uttered vagrant philosophies on a vast number of subjects.

Wishing his strangely assorted guests a good night's repose, Selwyn had retired to his own room shortly after midnight, but, tired as he was, sleep refused to come. Like an etcher planning a series of scenes to be depicted, his mind summoned the various incidents of the night in a tedious cycle. The huddled figure at the foot of Cleopatra's steps; the fantastic airiness of Smyth with his shredded umbrella; the smoky atmosphere of Archibald's, with its strange gathering of derelicts; the two chance acquaintances spending the night in the adjoining room—what vivid, disjointed cameos they were! If there was such a thing as Fate, what meaning could there be in their having met? Or was their meeting as purposeless as that of which some poet had once written—two pieces of plank-wood touching in mid-ocean and drifting eternally?

It seemed that the low voices of the others had been going on for more than an hour when the sense of absolute stillness told Selwyn that he must have fallen asleep for an interval. He listened for their voices, but nothing could be heard except the sleet driven against the windows, and a far-away clock striking the hour of two.

Wondering if his visitors were comfortable, he rose from his bed, and creeping softly to the living-room door, opened it enough to look in.

Smyth's heavy breathing, not made any lighter by his having his head completely covered by bed-clothes, indicated that the futurist was in the realm of Morpheus. Durwent was curled up

cosily by the fire, the blankets over him rising and subsiding slightly, conforming to his deep, tranquil breaths.

In the light of the fire, and with the warm glow of the skin caused by its heat and the refreshing bath, the pallor of dissipation had left the boy's face. In the musing curve of his full-blooded lips and in the corners of his closed eyes there was just the suggestion of a smile—the smile of a child tired from play. There was such refinement in the delicate nostrils dilating almost imperceptibly with the intake of each breath, and such spiritual smoothness in his brow contrasting with the glowing tincture of his face, that to the man looking down on him he seemed like a youth of some idyl, who could never have known the invasion of one sordid thought.

A feeling of infinite compassion came over Selwyn. He rebelled against the cruelty of vice that could fasten its claws on anything so fine, when there was so much human decay to feed upon.

The eyelids parted a little, and Selwyn stepped back towards the door.

'Hullo, Selwyn, old boy!' murmured Durwent dreamily. 'Is it time to get up?'

'No,' whispered Selwyn. 'I didn't mean to wake you.'

Durwent smiled deprecatingly and reached sleepily for the other's hand. 'It's awfully decent of you to take me in like this,' he said.

There was a simplicity in his gesture, a child-like sincerity in his voice, that made Selwyn accept the hand-clasp, unable to utter the words which came to his lips.

'Selwyn,' said Dick, keeping his face turned towards the fire, 'are you likely to see Elise soon?'

'I hardly think so,' said the American, kneeling down and stirring the coals with the poker.

'If you do—please don't tell her I've come back. She thinks I'm in the Orient somewhere, and if she knew I was joining up she would worry. I suppose I shall always be "Boy-blue" to her, and never anything older.'

Selwyn replaced the poker and sat down on a cushion that was on the floor.

'It may be a rotten thing to say,' resumed the younger man, speaking slowly, 'but she was more of a mother to me than my mother was. As far back as I can remember she was the one person who believed in me. The rest never did. When I was a kid at prep. school and brought home bad reports, every one seemed to think me an outsider—that I wasn't conforming—and I began to believe it. Only Elise never changed. She was the one of the whole family who didn't want me to be somebody or something else. You can hardly believe what that meant to me in those days. It was a little world I lived in, but to my youngster's eyes it looked as if everything and every person were on one side, doubting me

—and Elise was on the other, believing in me. . . . I'm not whining, Selwyn, or saying that any one's to blame for my life except myself, but I do believe that if Elise and I had been kept together I might not have turned out such a rotter. Sometimes, too, I wonder if it wouldn't have been better for her. She never made many friends—and looking back, I think the poor little girl has had a lonely time of it.'

He relapsed into silence and shifted his head wearily on the pillow. Johnston Smyth murmured something muffled and unintelligible in his sleep. Selwyn placed some new lumps of coal on the fire, the flames licking them eagerly as the sharp crackle of escaping gases punctured the sleep-laden air.

'It does sound rather like whining to say it,' said Durwent without opening his eyes, 'but after I was rusticated at Cambridge I tried to travel straight. If I had gone then to the Colonies I might have made a man of myself, but I hung around too long, and got mixed up with one of the rottenest sets in London. I went awfully low, Selwyn, but booze had me by the neck, and my conscience wasn't working very hard either. And then another woman helped me. . . . She was one of those who aren't admitted with decent people. She came of poor family, and had made a fairly good name for herself on the stage, and was absolutely straight until she met that blackguard Moorewell about three years ago.'

'The man you nearly killed?'

'Yes. At any rate, she and I fell in love with each other. I know it's all damned sordid, but we were both outcasts, and, as that chap said to-night, it's the people who have failed who lie closest to life. Once more a woman believed in me—and I believed in a woman. We planned to get married. We were going away under another name, to make a new world for ourselves. For weeks I never touched a drop, and it seemed at last that I could see—just a little light ahead. You don't know what that means, Selwyn, when a man is absolutely down.'

The smile had died out in the speaker's face and given way to a cold, gray mist of pain.

'Moorewell heard about it,' went on Durwent, 'and though the blackguard had discarded her, he grew jealous, and began his devilry again. She did not tell me, but I know for a long time she was as true to me as I was to her. Then they went to Paris—I believe he promised to marry her there. A week later I got a letter from her, begging forgiveness. He had left her, she said, and she was going away where I should never find her again. My first impulse was to follow her—and then I started to drink. God! what nights those were! I waited my time. I watched Moorewell until one night I knew he was alone. I forced an entrance, and caught him in his library. . . . As I said before, I was drunk; and that's what saved his life. I thought at the

time he was dead; and having no money, I caught a late train, and hid all night and next day in the woods at Roselawn. Three times I saw Elise, but she was never alone; but that night I called her with a cry of the night-jar which she had taught me. She came out, and I told her as much as I could; and with her necklace I raised some money and got away.'

Again the murmured words came to a close. Selwyn searched his mind for some comment to make, but none would come. He could not offer sympathy or condolence—Durwent wasn't seeking that. It was impossible to condemn, or to suggest a new start in life, because the young fellow was not trying to justify his actions. Yet it seemed such a tragedy to look helplessly on without one effort to change the floating course of the driftwood.

'Durwent,' he said haltingly, 'it's not too late for you to start over again. If you will go to America, I have friends there who would give you every opening and'—

'You're an awfully decent chap,' said Durwent, once more touching Selwyn's hand with his; 'but I shall not come back from the war. I felt *that* the moment I stepped on shore yesterday. I felt it again when that fellow spoke to me in the tavern. It may come soon, or it may be a long time, but this is the end.'

'No, no,' said Selwyn earnestly; 'all that's the effect of your chill. It has left you depressed.'

'You don't understand,' said the lad, smiling with closed eyes, 'or you wouldn't say that. I said before that it means a lot, when a man's down, to be able to see a little light ahead. . . . I can see that now again. . . . I have disgraced my name and falsified the belief my sister had in me, but—I shall be able to die a gentleman, and with the feeling that, even if my life was no good, my dying may in some little way help England to go on.'

Selwyn leaned over and patted the lad on his shoulder. 'Dick,' he said, 'wait until the morning, and all these fancies will clear from your mind. We'll discuss everything then together.'

The musing smile lingered again about the boy's lips.

'You're tired out, old man,' went on the American. 'I shouldn't have waked you. Good-night.'

The other stopped him from rising by catching his arm with his hand. 'Do you mind,' said Dick, his eyes opening wide, 'just staying here until I go to sleep? . . . There are all sorts of wild things going through my head to-night . . . and I've lost my courage a bit.'

And so for nearly half-an-hour the American remained watching by the lad as sleep hovered about and gradually settled on him.

As Selwyn quietly stole from the room the City's clocks were striking three.

POTS AND PANS.

By MARY HILL, Author of *Needlecraft in the Class-room, &c.*

IN our grandmother's kitchen on winter evenings the walls shone with the light reflected from the copper warming-pan and the brass candlesticks, with sometimes an added radiance from a copper kettle singing on the hob. Her saucepans and frying-pan were made of cast-iron, bought to last a lifetime, though there might be one of brass, kept sacred for the making of jam or the boiling of milk.

To-day the purpose of the warming-pan and the candlesticks is more generally ornamental than useful; but the kettles and the saucepans are still used as of yore, although other materials besides cast-iron are utilised for making them. As food is cooked in these pots and pans, it is most important that they should be kept scrupulously clean. The success of these cleansing operations depends a good deal upon one's knowledge of the metals used; for example, aluminium requires totally different treatment from iron, and brass is unlike either of them. It is, in effect, a case of one man's meat being another man's poison!

Most of us are interested in the subject from one point of view or another, and some idea of the characteristics and properties of the metals used should prove of considerable value when one comes to the practical work in the kitchen.

Iron, in one form or another, is so often used for domestic purposes that every housewife should know its outstanding features. All the instruments we generally use for cutting—knives, scissors, shears, and razors—are made of hard steel; while many saucepans, frying-pans, kettles, and garden tools are manufactured from cast-iron. Whatever the form of iron, however, it always has one serious defect: it tarnishes or rusts very readily, and this corrosion rapidly destroys the article. It must be remembered that a surface kept perfectly dry never rusts; for this red powdery substance is formed only when water is present. Further, a brightly polished article rusts far less readily than a dull one. Hence the iron saucepan must be thoroughly dry before it is put away, the scissors hung in a dry corner of the room, and the knives dried and polished immediately after being washed.

Why does the laundress remove 'iron mould' and ink-stains from linen by applying salts of lemon or oxalic acid? Simply because these acids combine with the iron in the stain and form a substance soluble in water, the stain vanishing when the article is put through the wash-tub. If fruits are placed in an iron saucepan, the acids in them, which are similar to oxalic acid, will act upon the metal, and a poisonous solution will be formed which mixes with the

cooking fruit. Iron pans must never, therefore, be used for jam-making or for boiling vinegar for pickling. Garden soil always contains a certain amount of acid, and all the garden tools—spades, forks, hoes, and rakes—should be thoroughly cleaned, scraped free of every particle of soil, before they are put away, or tiny pits will appear on the surface where the acid has acted upon the iron.

One method of preventing rust is to cover the metal, to keep out the air. A variety of ways can be found of doing this. If the article is to be stored, a coating of oil will be found effective.

Enamel-ware is iron covered with a glaze similar to that used on china, which protects the metal beneath from corrosion. Neither acids nor alkalis act upon the glaze, which is very suitable for cooking-utensils, so long as the enamel is not cracked. Careless handling or rapid changes of temperature when the pan is dry may cause it to crack. Care must be taken not to allow the saucepan 'to boil dry,' therefore—a practical application of one's knowledge of the expansion and the contraction of metals.

The so-called 'tin' kettles and other kitchen utensils are made from sheet-iron covered with a layer of tin, and zinc buckets and wash-tubs are manufactured from iron that has been treated with zinc in a similar fashion. When once the covering layer is broken the iron rusts very quickly under the tin; in the case of zinc the coating seems to protect, and hence articles such as buckets and watering-cans are made from 'galvanised iron,' as it is commonly called. Unfortunately acids act upon zinc, which should never be used for cooking purposes.

Before the cook uses her copper or brass pan for making jam she thoroughly cleans and polishes it inside, not for the pleasure of watching the ruddy juice glisten on the polished metal, but in order that her jam may be clean and wholesome when finished. Copper tarnish is soluble in weak acid; hence the housewife generally pours a little vinegar into her pan to clean it. Brass is an alloy of copper, and is treated in the same way; but although the acid removes the tarnish, fortunately it has no effect upon the metal itself. Fruits contain a quantity of acid; therefore a tarnished copper pan must never be used for preserving, although a polished one is eminently suitable for the purpose.

For lightness and cleanliness nothing can surpass the aluminium article for culinary purposes, but ignorance of the characteristics of the metal may lead the most careful housewife into great extravagance. Every one knows that grease can readily be removed by washing

with strong soda, and this is a perfectly harmless procedure with other utensils in the kitchen; but with the aluminium one it is fatal, for it removes not only the grease, but part of the metal as well. An aluminium pie-dish or saucepan is of little use for cooking purposes if fretted with tiny holes on the bottom.

We saw a teacher using a pan so damaged for another purpose the other day. The derelict pan, banished from the cookery-room, was standing in a bowl, with a good handful of soda in the pan. A number of small silver articles—girls' brooches, a silver pencil-case, silver-plated spoons and cream-jug—were placed on the top of the soda, and some boiling water poured over the whole. Hosts of tiny bubbles rose immediately from the surface of the alu-

minium, and in a few minutes the tarnish on the silver articles moved from them too. Clearly the new solution formed by the aluminium dissolved in the soda dissolved in its turn the silver tarnish or silver sulphide on the brooches and the spoons. The solution had no effect upon the silver, however. When the articles were taken from the water they were perfectly clean, and a brisk rub with a soft, dry duster produced a bright polish.

One virtue that aluminium possesses in common with bright copper or brass is that it is not affected by acids, and so may safely be used for cooking fruit or milk. It does not tarnish readily, and is very light. Its one drawback for kitchen use is its softness; it is easily bent and dented, and the repairing is a difficult matter.

A MIRACLE OF IRRIGATION.

I.

THE British in India and in Egypt, and the Americans in the desert lands of their own country, have performed marvels of irrigation that would have astonished the cleverest engineers of ancient times. In this field of modern enterprise there is no such word as failure, and the apparently impossible has been achieved over and over again by a happy combination of brilliant imagination, persistent courage and endurance, and dogged perseverance.

But in the whole story of irrigation enterprise there is nothing that, for sheer daring and triumphant grappling with Nature in her fiercest mood, can compare with the famous Uncompaghre Valley enterprise of the United States. Here a rushing torrential river was tamed and harnessed, a mountain-range was pierced, and a barren desert was made to blossom as the rose and produce food in ever-increasing quantities for man and beast.

The idea originated in the brain of a dreamer, the plan was conceived by two of the boldest engineers in the world, and the work was carried to successful completion by a band of brave and determined men, supported by the Government of their country.

Down in the south-west section of the State of Colorado, surrounded by mountains that are cut by winding rivers into mighty cañons, is the Uncompaghre Valley, a great stretch of what was, up to a few years ago, desert land. The soil was rich and the possibilities of the valley were immense, but the one thing needful to bring the fertile land into cultivation was missing: there was no water, except for the little Uncompaghre River, which in summer became nothing more than a trickling brook, and often in specially hot seasons dried up altogether.

This had been harnessed and used to irrigate

a small section of the valley close to it. The supply of water sufficed for only 20,000 acres, but hundreds of thousands more, equally rich, had to remain barren and dry because there was no more water available.

In the valley lived a Frenchman named Lauzon, one of the pioneers in bringing the water of the Uncompaghre River to irrigate the barren lands. He had seen how the increasing number of settlers, with their growing demands upon the river, had exhausted its volume, until many of them had had to give up their farms and allow the soil to go back into wilderness. Looking down upon the valley was a forbidding range of mountains, and six miles away, on the other side of this great rock-barrier, ran another river, the Gunnison, a rushing torrent with thousands of millions of gallons of water running to waste. Why not harness this river, pierce the mountain-range, and water the valley from the distant Gunnison cañon? The wild dream of an imaginative man! But Lauzon at any rate had the courage of his convictions. He did not let his dream die. He wired to the United States Reclamation Bureau in Washington: 'Can the Gunnison River be made to water the Uncompaghre Valley?' and when this telegram was received, no wonder the engineers and the officials looked at one another in astonishment.

But there is little red tape about the United States Reclamation Bureau. The more difficult the problem, the more teeming with apparent impossibilities, the more eager the officials are to carry it to a triumphant issue, if it will be for the national good. And so the engineers who received Lauzon's message, Mr A. L. Fellows and Mr W. W. Torrence, at once began to think how the great idea could be put into practice.

There was, however, an initial difficulty. The Gunnison River ran for a part of its course through a deep and fearsome cañon, cut at in-

accessible depths in the mountain-range, and it had never been surveyed or explored. Indeed, in many parts the river, 3000 feet and more down, had never even been seen; and where glimpses could be caught of the rushing torrent, the daylight penetrated the depths for only one or two hours out of the twenty-four.

Several men had in past years tried to explore the river, but though they had gone down into the cañon from above, they had never been seen again. The rushing waters had evidently carried them to destruction. Gunnison, the man who gave his name to the river, had followed the course till it entered the dark recesses of the mountain crags, but he had ventured no farther, and had called the inaccessible gorge through which the waters ran the Black Cañon.

A quarter of a century later the United States Geological Survey attempted its exploration, and men were lowered down the precipice by ropes, but at a thousand feet from the top they had signalled to be pulled up again, and stated that no man could descend the cañon and live. 'It is absolutely impenetrable,' declared Professor Hayden, in charge of the expedition; and his verdict appeared to be endorsed by the ill-fated attempts that had been made once or twice since.

II.

Despite all this, Mr Torrence decided that he would attempt to explore the cañon. If the Uncompaghe Valley was to be watered by the Gunnison River, a tunnel would have to be driven through the solid rock of the mountain-range and the water carried for six miles underground. As a preliminary, the cañon whence the tunnel must be driven would have to be thoroughly explored. All previous expeditions had been mere attempts to survey from the craggy sides of the cañon, the explorers being lowered by ropes; but Mr Torrence determined on a more daring, and, as it appeared, a more foolhardy, enterprise—namely, to go through the cañon with the river, and chance whether he ever came out alive. It must be remembered that this was absolutely unknown territory. The river might take strange and dangerous turns; there might be fearful cataracts at every few hundred yards; there might even be a sudden fall of fifty or a hundred feet—no one could say; and certainly no one could help the men who ventured into this Valley of the Shadow of Death.

Torrence induced three or four other men, intrepid like himself, to join him in the venture. They had two boats specially built—oak frames covered with canvas, so that any damage could be easily repaired; and as the journey through the cañon was expected to last a month, it was decided to take a store of easily carried foods, consisting entirely of canned meats and vegetables. No surplus was allowed, for there was to

be a good deal of other luggage, such as cameras, surveying instruments, note-books, and so on, all packed in tins to protect them from the water.

It was decided to embark on the river at a point where it flowed 1500 feet beneath the top of the chasm; and when everything was ready Torrence, with four colleagues, was lowered with the boats and the equipment. This in itself was a dangerous business, for the sharp edges of the jutting rocks might cut the ropes at any time. However, the task was completed satisfactorily, and a revolver-shot from the depths—a preconcerted signal—told those above that the party had reached the river in safety.

By a previous arrangement men were stationed at intervals along the top of the cañon, where the river was just visible for an hour or so each day when the sun shone directly down the chasm, and it was hoped that the explorers might be seen from time to time. But many days went by, and not a sign of the party was either seen or heard. All hope was, therefore, given up; and so certain were the watchers that destruction had overtaken the explorers that wire nets were stretched across the river at the mouth of the cañon in order that the bodies might be recovered.

Then came a great surprise, for one day some three weeks after the start a watcher peering into the depths through a pair of field-glasses saw what seemed to be three or four dots moving about among the rocks. He shouted and fired revolver-shots in the hope of attracting attention, but in vain. The dots were indeed the explorers, but the roaring of the torrent drowned all outside sounds. Then the watcher threw down a stone, and this, bounding from ledge to ledge, set other stones moving of ever-increasing size, until at last about a ton of rock was crashing down the precipice, and finally landed in the river, near the spot where the explorers were jumping from rock to rock. Fortunately it missed them, but it had the desired effect, and attracted attention. The men were able by waving cloths to signal to the watcher above.

Down below the explorers' experiences were as thrilling and perilous as might have been expected. The water was as cold as ice, and the roaring was so tremendous that they could talk only by shouting into one another's ears. Within a few minutes of starting upon their fateful journey they were drenched to the skin, as the rushing waters threw spray thirty feet into the air, covering everything within reach. Ordinary navigation was out of the question. Most of the time the men were scrambling from rock to rock, dragging their boats with them, and slipping into the water ever and again, for the boulders through thousands of years had been worn quite smooth by the waters of the river. In between were strips of quiet water, but these were few and far between.

At the end of the first day they had covered

less than a mile, and darkness coming on, they had to climb up and stay for the night on a ledge of rock. They were wet through, icy cold, and had nothing but cold food to eat—a truly dismal condition. The roaring of the torrent made conversation impossible; and, almost frozen to death, they had to wait without movement on their narrow rocky bed till morning.

As soon as a little light penetrated the cañon the men started again, but very soon their troubles increased. As they scrambled over the rocks, dragging their boats with them, the rope attached to one broke, and the boat was dashed away with all its stores, never to be seen again. The second night was spent in a cave. Thus day after day and night after night went by. The men were growing weaker, for the loss of their boat had necessitated the cutting down of rations, and it is not surprising that hope and courage began to flag. They could not go back, and with their now insufficient equipment they could not go forward much farther. Unless there was some way out, starvation must be their lot.

The gorge became narrower, with no ledges on either side, and there was nothing for it but to plunge into the stream and swim, holding on to the sides of the remaining boat as it was tossed from side to side in its course. To attempt to travel inside the boat would have meant certain destruction in such a torrent. At this point, when want and hardship and semi-darkness had made the men weak and pale and disappointed, right ahead they could see the river rushing into a dark and fearsome tunnel formed by the falling from above through the ages of millions of tons of rock and stone. They dared not venture into the unknown depths of this tunnel, and so, feeble though they were, they had to climb over the top of the obstruction, still dragging their boat with them. On the other side the gorge narrowed to twenty-eight feet, while frowning down were beetling walls about 3000 feet in height. The water rushed like a mill-race in flood, and in the distance they could hear the roar of a great cataract, which they named the Falls of Sorrow.

'With our present equipment,' wrote Torrence in his note-book, 'we can go no farther;' then, with imperishable hope, he added: 'The Black Cañon is not impenetrable. If I get out of this alive, I shall come back.'

Torrence was, all through, the life and soul of the expedition, and it was he who now found a way of escape. He noticed a zigzag kind of course on one side of the rocky chasm, probably the old bed of some prehistoric waterway from the upper part of the cañon to the bottom, and pointing it out to his companions, he inspired them to attempt the ascent perilous. At places the path, if it could be called such, was at an angle of eighty degrees, but, roped together, the men struggled up. They could not carry a load

up such a path, and so they first of all ate heartily, and then took sufficient for one more meal, abandoning the rest of their stores.

Torrence led the way, and as they slowly and painfully struggled up they always had the fear that the path might be blocked and prove a dead-end. At a height of over 2000 feet night came on, and they were still at least 500 feet from the top; but to remain in their then position was impossible, and so they still struggled on, trusting to chance and the instinct of Torrence.

The end of the journey was dramatic. Not knowing he was near the top, Torrence suddenly found himself with the starry horizon all round. The other men followed, and all were safe. They found later that they had covered exactly fourteen miles of the river's course, and had taken twenty-one days in doing it.

III.

So far from being dispirited, Torrence at once set about preparing another expedition, this time to go right through the cañon. There were to be only two in the party—Torrence and Fellows, already mentioned. Profiting by the previous experience, they decided that boats were useless, and so they invented a new kind of raft consisting of a rubber mattress, divided into a number of independent air-compartments like a Zeppelin. If one or two of these air-chambers were damaged, the others would keep the raft buoyant. Hand-ropes were fitted all round so that the men could wade or swim and hold on; and the stores, food, note-books, cameras, and so on were packed in watertight receptacles and fastened securely to the raft.

Once again Torrence, with his companion, was lowered down the precipice into the cañon; and this time the first part of their journey, though hazardous, was more successful. They had the former expedition to guide them, and knew something of the course. In a fortnight they had reached the Falls of Sorrow. Here, however, the unknown again faced them. They plunged over the falls, holding on to their raft, and at some places the danger was so great that they lashed themselves to it for fear that they might be swept away.

Progress now became very slow. At one point they took three hours to go sixty feet. At night they had to rest on narrow ledges of rock, wet through, and perpetually sprayed with the spume from the rushing river. Soon the cañon became deeper and narrower, and passing round a bend, they discovered that the river fell over a precipice. There was no turning back, and they would have to go over the falls. What their fate would be they could not say. Would they be dashed upon rocks, which would mean certain death, or would they fall into comparatively deep water, where they would have a chance of life?

It was decided that Fellows should go over

first, then the raft with all the stores firmly fixed to it, and finally Torrence would take the great plunge. Fellows leapt over the edge and disappeared; then Torrence, after waiting a few moments, released the raft, and very soon after followed. He must have lost consciousness, and remembered nothing until he found himself gripping a rock against which he had been washed. Fellows also remembered nothing after the plunge until he discovered himself lying on a rock, having apparently been washed there; and—wonder of wonders!—the raft, too, was safe, being wedged between some boulders.

The men were utterly exhausted, and could do nothing but lie on the rocks for hours and rest. Their food was nearly gone, and they had the last of it before starting again. Both explorers were now very faint and emaciated, and their chance of emerging from the cañon seemed small indeed. But after further painful progress a remarkable thing happened. They dragged themselves up on to a ledge, wet, cold, numbed, and hungry, and with no prospect of food, when suddenly a mountain-sheep bounded down upon the ledge—whence they never could tell. They caught it, killed it, and ate its flesh; and there is little doubt that this sheep, by replenishing their store of food, saved their lives.

Renewed in strength and hope, and warmed to some extent, they once again set forth on the quest perilous. Before long they came to another tunnel, greater than that at the Falls of Sorrow. The mass of rock above was far too precipitous to be climbed over, as in the other case. It was impossible to go back, and there was nothing for it but to risk their lives by committing themselves to the river and going with it into the tunnel.

At the entrance to the dark passage was a whirlpool, and into this Fellows leapt. Torrence then released the raft and jumped himself. He remembered very little till he found himself once more in daylight, clutched by Fellows, who was holding on to a rock. Fellows had been buffeted through the tunnel and then hurled against this rock, and just as he was pulling himself up he spied Torrence, and saved his comrade's life in the nick of time.

For a moment the men looked at one another, and then Fellows shouted, 'Who says now that the Black Cañon is impassable?' Not far away the walls were less precipitous, and the men found a place where they could crawl to the top. They had explored thirty miles of the cañon through which no living man had ever travelled before.

IV.

In their report to the Reclamation Bureau they strongly urged the feasibility of cutting a tunnel through the mountains and diverting the Gunnison River into the Uncompaghere Valley, and the department decided to proceed with

the work. But an enormous amount of preparation had to be carried out first. The cañon had to be properly mapped, levels had to be taken, a great slanting roadway had to be blasted out of the solid rock from the top of the cañon to the bottom, down which the tunnelling machinery, with the workmen and supplies, could be conveyed. To make this road hundreds of thousands of tons of rock had to be blown away by dynamite, and it has been described as the most remarkable highway the world has ever seen. When it was done a town grew up at its foot, right down in what was once the impenetrable cañon, for the housing of the workmen. There were houses, workshops, canteens, and power establishments; and tunnelling into the mountain-range began there at the same time as another party, who had built another mushroom town, began tunnelling from the Uncompaghere side.

A world's record was established by the excavation of 823 feet in a single month. Every kind of difficulty known to tunnelling was encountered. Subterranean springs were tapped; masses of rock caved in where the tunnel had been bored; accumulations of gas nearly led to explosions and suffocation; and underground quicksands were encountered, which had to be platformed with timber before they could be passed. On one day of twenty-four hours no less a quantity than three quarters of a million gallons of water was pumped out. Begun in 1903, the work went on for over six years, day and night shifts labouring without cessation, and 250 feet a month was excavated on an average. Altogether 5,000,000 wagon-loads of rock were removed from the mountains, and at length the two parties working in opposite directions met and clasped hands. The mountain-range was pierced, and a new artificial channel for the Gunnison River was made.

Much, of course, still remained to be done, but this was easy work compared with what had already been accomplished, and at last all was ready. In September 1909 President Taft went to the scene, pressed a button, and the Gunnison River came roaring through the tunnel into the Uncompaghere Valley to begin its work of transforming the desert into a garden. Among those present on that historic occasion was the little Frenchman Lauzon, whose imaginative mind had first set the wonderful work in motion.

THE VISION.

LARKS in the sky, and all the meadows starr'd
With silver and with gold;
A mist of bluebells, drifting in the woods,
The cuckoo's name retold.

And in this soul of mine a faith new-born
Mounts on an upward wing;
Dear God, immortal youth is not a dream—
No dream, eternal Spring!

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

ONE of the strange, significant effects of the cataclysm suffered by the nations has been the wider separation of places by time (which is the equivalent of space), and thus, in a sense, the expansion of the world—a reversal of the tendency of pre-war times, when we were wont to say that by the increase and improvement of communications the world was being closely contracted. By steam and electricity the most distant lands were brought within the compass of a swift and comfortable journey, in duration but a half or a quarter of that involved in the days when they who went down to the sea in ships trusted to the winds for the power to speed them on, and they who travelled over wide breadths of lands had to depend on animals to drag their coaches. The same conditions governed the transport of written messages. That might once have been a matter of weeks, but invention, progress, and peace reduced the period to days and hours and minutes. Man had the pride of achieving more than in the boast of Puck, who would 'put a girdle round about the earth in forty minutes,' for his electric waves and the words they meant would flash around the hemispheres with nearly the speed of thought itself. That was progress, bringing the world into a general and close communion, from which an infinite advantage rose. From this state of pride and promise there has been harsh and destructive reaction, lapsing to the crudities of far-distant times. The strands of the marvellous net of communications were cut—or tangled—when the nations were at war. It has been found difficult or impossible to repair them again in the time that has elapsed since the shooting and the killing ceased, and in this slowness of recovery, the inability to recuperate from the havoc of such orgy, when there had been quick recuperation and then faster progress after smaller wars before, there is the warning of Nature, the same to nations as to profligate individuals, that at last the limits have been exceeded. That is the way in which many feel the significance of conditions that surround us now; it is told in every circumstance that we have gone too far, and it appears that amid this reaction, this loss of the gains of progress and the failure

to recover quickly, the sad dilemma of the victims, their consternation, their perplexity, their suffering, there is after all a heartening encouragement against an appalling fear that it was as the settled scheme of creation that the evolution of man to a fair and lofty destiny should be achieved only by the perpetual killing of his kind. If an improving, refining process invariably followed his periodic lapses to the methods of the lower animals, this fear must be substantiated and enhanced; when it is otherwise, we may feel that the human race, if it wills, may turn from homicide, justifiable or not, with confidence that there is no master-instinct impelling it in the name of Nature and of destiny to recurring tragedies, that these are not the ways of Heaven, that they are of the free volition of unstable beings insufficiently developed. If the fatalistic doctrine of militarists were true, a League of Nations would be mere stupidity; in the chaos, the reactions of the times, following upon the greatest orgy of homicide, there is the most splendid encouragement that this society could have, for its ideal is evidently not contrary to any eternal law that will lead man on to some higher state.

* * *

Ill and remorseful, the world now sees its once close-knit self as a number of scattered and isolated fragments, jolting uneasily and uncertainly, with no guidance or direction, through a space that is terrifying in its doubts and immanities. Some of them in the greater isolations are like explorers cut loose from their bases in civilisation. It is in this unhappy and unsatisfactory sense that we find the world suddenly expanded now. Six years ago peace and progress had reduced the time for the transmission of a letter from England to the United States to six days. We find now that a fortnight or more is continually needed, though the period was no longer in time of war. With the fastest ships the world has ever known at our disposal, our advantage is reduced to that of our forefathers who had but wind and sails for their assistance. So there is no other cause than the unexpected, staggering inability to recover with reasonable quickness from the chaos of administration and the inertia of reaction established by the recent conflict. Communications by cable and land

telegraph are similarly slowed. It is true that the aeroplane begins a new era dazzling in its promise, but not yet can it restore the old balance of facility in communications, and if war is persisted in it can never do so, for natural progress will then be hindered and prevented by suspicion and by fear. And it must be realised that communication is Progress leading to a higher evolution. Units in human beings, nations, are not self-contained in their potentiality for development, even as sexes are not. They must commingle; the more and to better effect they do so, the sounder and the swifter will be their progress, each deriving life and stimulus from the special vitalities that others gather from the resources of the earth and their own thoughts and effort. It is from the closing together of the peoples as a society, from their associated impetus, that advancement comes. Something of this interdependence, the necessity of it, the leaning of the nations upon each other, is realised to-day as never before in the economic confusion, with all the loss, the suffering, and the contradictions it involves, now prevailing as the result partly of interference with this principle of the intimacy and cohesion of the world as a society. Improve communications, and the social bonds are tightened and strengthened; peoples become more fructuous. So, when communications increase and are bettered, we are on the way to progress; when they decrease and are weakened, we go back.

* * *

Perhaps in Europe we never had a full sense of the worth of communications as they have always had in the world in the West, where their value was so hard impressed upon men at the beginning. We have not realised that speedier communication and more of it is the exact equivalent of increased energy and work, and that by bettering it we should have an enhanced power for production, advancement, and happiness as the ultimate end. If we had appreciated this truth, we—or our rulers for us—could not, even in war, have suppressed, or demolished, or hindered communications when by logic they should have been improved. Travelling for serious purposes would not have been handicapped; the telephone would not have been denied; the posted letter would not have been made to cost us more. Still less would such impediments and disabilities have been permitted to endure when the war was done. In the United States the principle of communication being progress has always been fully recognised. There the facilities for it are strengthened to the utmost in every department. Whatever else is dear, you find that the means of progress are usually comparatively cheap and marvellously good. America made and exploited the typewriter as no other country did, or has been able to do. I have often

stepped from the side-walk in a New York or a Chicago street into a hotel as a fancy or an impulse seized me, and, finding a public typewriter on a special table in the corner of a lounge, have dropped a dime into a slot and released it for my purposes, as any passer-by might do. The hotels themselves are a vital and predominant feature of the general scheme of communications, and see how America has exploited them. See also how pitifully London has lagged behind. Those who have not moved about in the United States cannot form any conception of the perfection of the American hotel system, and its palpable enormous advantages. It is true that these establishments have features that sometimes strike a little harshly upon the susceptible dispositions of some Eastern visitors; but we speak of communications and progress, and not of sweet tranquillities. Then I have bought in the Fifth Avenue of New York—no place for economies in the general way—by far the best and at the same time the cheapest travelling-trunks I have ever seen. In all these considerations there is an insistent moral. Even at much sacrifice in other ways, we of the old Eastern world must determine to restore our old communications to their former value quickly, and improve upon them. It is too easy to become accustomed, and by being accustomed to be satisfied, with a reactionary decline, and only those who since the war have wandered much from our British Isles fully realise the extent to which our communications have been reduced, and the disintegration of the European social and economic system which has been caused thereby. The state of things is extraordinary; it leads to amazing isolations. Lately I was in a European capital hardly more than a thousand miles from London as an aeroplane might in a few hours fly, yet regularly it took a week for letters to pass from that capital to London, sometimes more, even twelve days upon occasion. And sometimes a week or more was needed for a telegram to pass between them. It has been explained that for lack of ample telegraphic facilities—which were more than sufficient six years ago, when the demand upon them by the people was greater than it is now—telegrams between foreign countries and this place were at times sent by the post, although accepted as telegrams. I have some strong circumstantial proof of this. A telegram was sent to me when in this city from London, and immediately after delivering the message to the telegraph-office in the shadow of Westminster Abbey, the Houses of Parliament, and the seat of the mightiest Government in the world, the sender covered it, as the saying is, by a letter informing me of the despatch of the said telegram and its contents. A week later I received the letter, and some six hours afterwards there arrived the telegram. I was then at a seaside resort within

fifteen miles of the capital city, and the telegram bore as the place of despatch not London, of which indeed there was no mention, but the name of this capital city. Presumably it had been put upon the wires there for the first time, having arrived by the same mail as the letter. As between this country of which I speak and its near neighbour by land, which is France, they tell you frankly the position in regard to the telegraphs. You may pay at the ordinary rates for a telegraphic message—and sufficiently high they are—and the addressee may receive it within a week, but it is only on the borderland of probability that he will do so, while a letter will make the journey in four days, the train in one and a half, and an aeroplane in four or five hours. So that which should be the first is the last. Yet perceive the subtlety of Government tricks, extortions, and indifference to the overpowering essentials of the righting and the progress of the world: it is not impossible to make the message travel quickly—it is just a matter of more payment beyond that which for many years was established and accepted as fair. Pay double the proper fees and the telegraph authorities will mark the message as 'urgent,' and it will then meander through in one day.

* * *

There are many reasons why the world has difficulty in righting itself after its shattering experiences in recent years, but not the least of them is this overlooked subject of communications, the most vital means of progress and balance in the modern world. By reason of their absence individual persons and nations alike, lacking close and continual contact, are left to their own devices, weaken in their sense of responsibility, and fall away from the world scheme of things whose homogeneity, as we have discovered in the making of the peace with our late enemies, is an essential to world life, prosperity, and happiness to-day. A people isolated is in danger; it is apt to depart widely and wildly from the standards that rightly or wrongly have been accepted as those that best facilitate well-being. Each individual Briton will be making a small contribution to the cause of rehabilitation after war if in his political and other capacities he insists on the restoration of all communications—railways, telegraphs, telephones, posts, and every kind—to the efficiency at least, and to the cheapness also, at which they stood in 1914; and one should not be put off by the specious plea that it cannot be done by reason of the cost. If we are to restore contentment and happiness, this must be done, and something else should be dispensed with. In no matter so much as in this do statesmen exhibit the lamentable shortness of their vision, a strange incompetence, a sacrifice of all to their personal, selfish politics. Millions may be voted for new armies and new wars after the great war which was to end all

fighting for evermore was over, but travelling for urgent or any reason, letters in the post, telegraphs, telephones, and everything by which the world is made to understand itself and do its business must be charged half as much again—and be worse than ever organised in spite of the extra cost. We hear much each day of the terrible situation of economics and the exchanges, and of the havoc caused thereby to business and to life generally. Put the communications right, make some approach to perfection in them, and we have the sure remedy for these troubles. It is trade that is needed to make economics and the exchanges sound, and communications engender trade as fire produces heat.

* * *

Let it be insisted again that the existing circumstances and disabilities do not arise from absolute necessities created by war, but result from plain neglect, lack of imagination and comprehension, excessive devotion to mere politics, and in certain cases to deliberate reactionary tendencies on the part of Governments. Generally they escape popular condemnation because it appears that most of the difficulties have what we might term negative causes; they issue from things left undone after the war, things which should have been done immediately, and not from new and directed action. But here and there such action, with the object of restriction, has taken place, and so the cause in such cases is positive. In this class we may include the revised regulations for passports. By means of these passports Governments attain two objects, the first of which is to harass the traveller and needlessly to oppress him with a false sense of the difficulties of the world, and thus enhance their own importance, and possibly by some chance in part justify their own political caperings and egregious stupidities; and the second is to give employment to thousands of officials at the public expense and extract from the people sums of money that need never be expended in such a way. The day of passports is over. It is well known that even during the war, when the justification for them was evident, they were only in a small degree effectual. A person who wished to travel, and had no proper business to be doing so, could easily circumvent the passport system if he wished, and it was done repeatedly; while the legitimate traveller, who had business of a kind that was conceivably for the good of his country, was put through an ordeal of visits and forms that seemed almost endless, and at the Passport Office in Victoria Street, London, was notoriously subjected to insulting treatment by vulgar and uneducated minor officials, whatever might be the station and quality of the applicant, and however courteous might be his manner. But to pass over this ordeal (of which many thousands of persons will retain the bitterest remembrances for many

years) as being an unavoidable accompaniment of war conditions, the state of things now is in some respects more aggravating, as the last vestige of excuse for the passport system and its last possible service have disappeared. Those who have travelled—and I have travelled much of late—know that by no chance whatever can this system operate successfully now, yet it is applied rigorously, and most by those who in any case have least need for it; and it is done, no doubt, to strengthen bureaucracy by the employment of officials, to extract fees from the people—to pay the bureaucracy—and in certain cases to hinder the communications that should be as the breath of life to the gasping nations, and so promote reaction.

* * *

Let us be fair and admit that at the British end the state of things is vastly improved, though more might be done in the way of setting an example to the nations that they would be impelled to follow by the abandonment of the system altogether. France, in spite of much talk of abandonment, adheres tenaciously and ridiculously to the system. Lately I journeyed by sea from Southampton to Havre, landing at the latter port only for the purpose of changing immediately from one ship to another. It was a matter of five minutes' walk from one wharf to the other; that time and no longer did I need to be on this precious soil of France. But that I might step these few yards, nothing in my hands or pockets, I had to pass through the ordeal of passport examination by different officials (who, indeed, made no personal or proper examination of the passport or the particulars, and whom with the utmost ease I could have deceived) for, including waiting—think of it—two hours! And it was the same with a hundred others on that morning at Havre, when time was valuable, and when the French papers were crammed with articles about the necessity of the people doing good and useful work to restore trade balances and make the franc a coin of value and respectability again. The *visé* nuisance is the ultimate perfection of bureaucratic meddlesomeness and nonsense, to the detriment of all the essential interests of communities. At every move there must be a *visé*; people who would wander in this wonderful world often find themselves more hampered than the barbarians did. To move across the frontier from France to Italy—Allies, remember—though it be only a few yards on foot and in sight of the soldiery all the time, and though he have but his shirt to cover him and no papers or any goods whatsoever in his possession—yea, even though he were *in puris naturalibus*—the adventurer must have his passport, and it must be put through the *visé* process at the prefecture at Nice beforehand. There is a point on this frontier, at Ventimiglia on the Riviera, where walkers from Mentone have been

accustomed just to step across to admire the view, or as a matter of fancy. To do that now they must have their passport, and it must have the special *visé* at Nice, for the regulations point out particularly that it is wrong to imagine, as many visitors and excursionists do, that they can proceed to Italy without a passport, and insist that the document and *visés* are necessary even when one would go but a few hundred yards into Italy. How then, with all this, shall we reproach the Americans when they urge us to put aside our stupidities and work if we would be happy and prosperous again? The smaller nations without even the shadow of excuse that others, overborne by war, might consider themselves to possess take their time from their betters and exploit this new vein of bureaucracy. Spain needs no passport system, but she adopted it as did the belligerents, and adheres to it even more tenaciously now, since in this paradise for bureaucrats it gives more employment to thousands of officials and yields an immensity of unearned pesetas. Think of travelling from London to Spain, and you are informed that your passport must have the *visé* from the Spanish consul at an inconvenient place in the city near the Tower, where courtesy and consideration are not of the true Spanish kind. Pass on your way to Spain through Portugal, as many do, and then it is insisted that there shall be another *visé* by the Spanish consul at Lisbon—two sets of officials to this tremendous business; two sets of fees. And now, to expose the wanton bureaucratic fraud and nonsense of it all, the passport thus with so much difficulty obtained, thus so much stamped with *visés*, thus so much handled in advance by different sets of officials, and thus so much paid for, has served its bureaucratic end. You pass the frontier with this precious document into the new country, admission to which had seemed so jealously guarded, and, lo! they do not ask you for your passport! They do not want it; it is nothing. It has served its bureaucratic purpose. Here I write from personal experience.

* * *

If Europe is to come to its better self again, it must put away these childish tricks, and set to work in the way of honest sense. And for the traveller, though the Governments do not say that he shall no longer adventure forth, he must understand that they make every kind of difficulty for him, and that travelling, indeed, which many now anticipate with keen desire, is by no means what it used to be. In every direction it is vastly more expensive, far more difficult, rougher, and more uncomfortable. Governments make it so; they conspire with other agencies to that end. They would have the units to rest on spots at home, not to move therefrom, to rust and rot and be actionless thereon. Business men wail at the hindrances

set up against them, and Europe goes starving on. Countries that are near to us, and friends, become, through failure in communications, remote, almost like lost planets. Take Portugal, for example, our 'oldest Ally.' What news did you see of Portugal in the papers for days and days? Yet I do not think that there is a country in

Europe where the events progressing are at the same time graver or more remarkably, romantically interesting than those passing in Portugal at the present period, and they are of world importance. Recently I spent much time in Portugal, and was astonished. I shall write of what I saw.

TELLING THE BEES.

By VIOLET M. METHLEY.

I.

'I CAN'T shake hands, Captain Crohane; and you had better keep at a distance, really! I've a terribly pugnacious bodyguard; so don't try to come near me.'

'I won't.' Captain Crohane retired behind a lavender-bush, more speedily than became an officer and a gentleman, before the rapid advance of a slim, yellow-barred insect. 'I say! Call off the little swine, Miss Danvers; he's going to bite me!'

'He won't if you stand perfectly still, and don't show that you're frightened. Of course, if you wave about your arms like that, they *will* attack you.'

'I believe the brutes are jealous of me—hark, how they're cursing! Or perhaps it's just an ordinary Hymn of Hate, because they were enemy aliens before the outbreak of Peace—Blue Hungarians, didn't you say?'

'Ligurians, I suppose you mean.'

'It's all the same. Here, they're attacking in force! Keep off, will you? Hi! Shoo!'

'They're a particularly fierce kind with strangers, and you'll get badly stung if you go on like that. . . . Oh, Captain Crohane, do go into the cottage, and wait in the parlour, while I finish here! The poor little things will only lose their tempers if you tease them in that way.'

'Tease them, indeed!' the young man protested indignantly. 'It's me they're teasing. All right, I'll go inside and wait, if it will set your mind at ease, Miss Danvers.'

Leaning out through the open window of the parlour, between the pots of musk and lemon verbena, Patrick Crohane watched Jacqueline Danvers as she moved to and fro by the row of hives. A pale-green overall covered her from head to foot; a beekeeper's mask hid her face and hair; only her pretty hands were bare. Yet the bees, settling upon them, crawling over her wrists, made no attempt to sting, even when she brushed them off with deliberate, unhurried movements,

'No, they never hurt me.' Jacqueline glanced up, in answer to a comment from the young man. 'We know each other so well, and I'm sure they are fond of me; yes, really, although you might not believe it.'

'It isn't so very incredible. I've always

heard that bees are singularly intelligent creatures,' Crohane said gravely.

'Oh, they are; they're simply wonderful! I'm certain they know whether I'm happy, or bothered, or lonely, or cross; they've instincts, intuitions. I can quite understand how that old country superstition grew up about telling the bees everything that happened to their owners. You'll think me perfectly mad, but they're such strange, strange little creatures, and so tremendously interesting. I'm getting to know quite a lot about their ways and customs: I can tell when they're worried or excited. Just now, for instance, I'm certain they are planning to swarm; there's quite a different note in their humming. Can't *you* hear it?'

'Thanks. I'm not calm enough in the presence of a bee to notice these fine shades of expression. But if you don't come in soon, I shall be madly jealous of the little beasts. There's only a couple of hours before my train goes.'

'All right; I'm coming.' Jacqueline glanced along the row of neat, business-like bee-houses, and came into the cottage, pulling off her mask as she did so.

'That's better.' She pushed back a dark-brown lock from her hot, flushed cheek. 'No, it isn't safe to come near me yet. Ah, I thought so! Get out, you little villains!' She gathered a couple of bees from the folds of her overall as she spoke, and tossed them gently out through the window into the warm, midsummer air. 'Now I'm ready to be civil, Captain Crohane—' she began—and completed her sentence in quite an unpremeditated fashion, with Crohane's arms holding her close. 'Oh—Pat'—

'Jacqueline—Jacqueline! Oh, little girl, how ever have I managed without you for thirty-three years?' Crohane whispered, and the conversation degenerated, then and there, to a level of sickly sentiment equalled only by the best-selling transatlantic novels, and quite beneath the intelligence of British readers.

II.

It was nearly half-an-hour before a comparatively lucid interval supervened, as they sat together—very much together—in the low, broad window-seat.

'Pat, I've got to tell you something'—Jac-

queline's voice was rather unsteady as she twisted one of his coat-buttons—'I—I've been engaged before.'

'You disgraceful little wretch! But it's my own silly fault for not having discovered you earlier. And—you didn't love him, my child—not like this?'

'No. I *hated* him.'

'All the time?'

'Very nearly all the time, I think. Pat, I hated him so much that I was glad—yes, glad!—when he was killed in the war. I've tried not to believe it, tried to think that I couldn't have been such a brute; but I was—at the back of my heart, I *was*. It was a relief to think that I should never see him, never hear from him, again.'

'How did it happen, dearest?' Crohane's voice was almost womanly in its sympathy, as he drew her still nearer to him.

'I'm not sure—really, I'm not! It was nearly seven years ago, when I was only eighteen. I was terribly miserable, terribly lonely, when my father died suddenly; it didn't seem to matter what I did. So, when Vincent Corfield asked me to marry him, over and over again, I let myself be engaged to him. But I know now that I never loved him really, and, very soon, I hated him.'

'So you broke off the engagement—naturally?'

'Yes, I broke it off. I hated doing it. I tried not to be unkind; but he—he wouldn't accept it, Pat! He refused to release me; he insisted that I was still bound to him.'

'The cad!'

'I'm sure now that he wasn't altogether sane, Pat—that there was something abnormal, warped, in him. His jealousy, his violence, his fits of passion about nothing, whilst we were engaged. And afterwards—afterwards'—

The girl shivered and crept closer to Crohane, as he tightened the clasp of his arm about her.

'Don't think of it any more, darling,' he said softly.

'I can't help it—sometimes. It was awful, Pat. He wouldn't leave me alone—wouldn't accept what I said. He wrote constantly—followed me about. I had no men-relations who could help me, and it seemed so awful to think of going to the police. It ended only when war broke out, and Vincent had to rejoin his regiment. He went out with the Expeditionary Force, and he was killed within a month . . . and I was glad.'

'No wonder, sweetheart; no wonder. Why wasn't I here to look after you? And then you came here, to the cottage and the bees?'

'Yes—after three years as a V.A.D. in France—and even the work didn't make me altogether forget that horrible time. It seems like a nightmare now, as though I'd been in a hateful, spell-bound sleep, until—until the Prince came to wake me up.'

She raised her face to Crohane's, with a look upon it very earnest, very tender. He bent and kissed her gently.

'It's all over now,' he said.

III.

Half-an-hour later Patrick Crohane departed, stationwards, escorted to the gate by Jacqueline. He looked back from the end of the short lane, to see her standing, framed in a tangle of larkspur and snapdragon and columbines, old-world flowers, too sweet and simple to be labelled as delphinium and antirrhinum and aquilegia.

Jacqueline remained leaning over the white gate for a few minutes after Crohane had disappeared; then she returned slowly up the flagged path towards the cottage. She paused beside the row of hives, and gave a little half-shy laugh as she remembered some of her words to Crohane.

Leaning down until her cheek rested against the green-painted pent-roof of the nearest hive, she whispered under her breath, 'I want to tell you, bees, I'm very happy—very, very happy, because he loves me. You're glad, bees, aren't you? Because you love me, too.'

To Jacqueline's fancy it seemed that the low, murmurous buzzing within the hives grew and swelled, on a deeper note, into a low, musical roar, as though in response to her words. She laughed again at her own lively imagination, and ran on into the cottage, and up to the big garret, cool even to-day, under the thatch.

Here, on shelves and tables, were pots of honey, full and empty sections, boxes, jars, funnels, bottles—all the appliances of a business-like and successful beekeeper. Here Jacqueline spent many hours of her days, and here she set to work now, re-covering and labelling a tableful of jars.

At first the girl hummed low under her breath, like some musical bee herself; then gradually her voice rose, until she was singing aloud, clearly and sweetly.

Perhaps the bees heard it out there in the garden, as they buzzed and stirred, feverishly and uneasily, about the largest of the hives. Certainly another heard it, and was guided by the sound.

Suddenly Jacqueline ceased to sing, and turned expectantly towards the door. Some one was ascending the creaking stairs to the attic. Nobody lived in the house except herself. It must be an outsider, a caller—the vicar's daughter, perhaps, or the doctor's wife; they often came straight up to her through the always-open door. But—this was a man's footfall.

Could Pat have returned? Jacqueline took a step forward at the very thought, and her cheeks flushed. Then she paused, and the jar which she was holding fell, with a little clash of breaking glass. Her face grew white, her eyes darkened and widened, as she stood staring—

staring—at the figure of a man framed in the low doorway.

He was tall and gaunt and broad-shouldered, with a sallow skin and very dark hair. His eyes were narrowed; his lips wore a twisted smile, which broadened to a laugh as he saw Jacqueline's face.

'You did not expect to see *me*!' he said.

'No'—Jacqueline dragged out the words by an effort. 'I—we heard—I thought you were—killed.'

'You *hoped* I was killed—yes. But I wasn't—only a prisoner. And now I'm free again.'

'I—I'm glad'—Jacqueline struggled fiercely to control her voice, to regain her self-possession.

'No; you're sorry. And you have reason to be'—

In his half-closed eyes a strange light was burning, a light which Jacqueline remembered to have seen, by fitful gleams, in the old days, when fits of jealous passion shook and tore him. She knew now, what she had only vaguely guessed at then, that it was the light of madness. A cold shiver ran through her body, but she faced him bravely. 'I have no reason to be afraid of you, Vincent,' she said. 'I have never wronged you.'

'Never wronged me? Not to-day, when you allowed another man to make love to you—you, who are bound to me? Oh, I saw you with the fellow; I watched you when you sat at the window, when you stood with him at the gate—curse him!'

'I am not bound to you, Vincent. I am free.'

'That is a lie! I never released you from your promise. I never will release you. If it takes two to make an engagement, it takes two to break it. I've had plenty of time to think it over, and I've not changed my mind about *that*!'

His voice dropped to a snarl; his lips, up-curved, showed the strong, white teeth. Jacqueline leant against the table, her nails driving into the wood, as she clutched at its edge.

Corfield turned and deliberately closed the door, locked it, and dropped the key into his waistcoat-pocket. 'You see, you are not free, even in body,' he said. 'You are mine—mine—*mine*!'

His voice sank to a hoarse, strained whisper; his eyes, with that dull glare in them, never left Jacqueline's face, and the girl stared back at him, her whole body rigid and fixed. Her mind had felt stunned and rigid, too; only now did she realise that she was in extreme physical danger.

IV.

Jacqueline glanced over her shoulder towards the window. There was a sheer drop of thirty feet and more to the ground.

Corfield laughed. 'No escape that way!' he mocked her. 'No escape at all, my dear.'

'What do you mean? What do you want?' Jacqueline faced him defiantly.

'I want what belongs to me, what I refuse to give up! I want—you! Oh, not because I love you now; quite the contrary.'

Again he smiled, and came a step nearer. A queer, half-stifled sob burst from Jacqueline's throat, and the man laughed outright. 'No use to scream,' he said; and Jacqueline knew that it was true.

Her little char-girl had returned home to the village a couple of hours before; the nearest cottage was half a mile away; there was not even a dog in the house. She was quite alone, and Pat—Pat was in the train by now, leaning back in the carriage corner, thinking of her, picturing her—

'Ah-h!'

A little sobbing cry escaped Jacqueline as Corfield strode closer and clutched her wrist. 'You're *mine*, do you understand?' he said. 'I swore no other man should have you, or, if he *does*' . . . His eyes dilated; their dull glare was intensified. He ended with a low, mocking laugh, and repeated slowly, 'If he does' . . .

'Vincent, why should you wish to hurt me?' Jacqueline struggled to make her dry lips form the words.

'It's all I lived for—to hurt you. I've thought of nothing else, sleeping and waking'—again his eyes contracted and dilated—'I've been waiting for this moment. I knew it would come.'

He pressed closer, forcing the girl back into the angle between the fireplace and the window. He towered over her, lanky, powerful, one hand still gripping her wrist, the other pressed against the wall, level with her shoulder, hemming her in. He thrust his strained, distorted face closer to hers.

'Now, how will you escape me?' he snarled.

Jacqueline's hopeless, desperate eyes turned this way and that. She was utterly helpless. If she struggled—fought—it could only be for a moment.

And outside, the garden drowsed peacefully in the afternoon sunshine; the butterflies and the bees were happily busy amongst the flowers—the bees, her little friends.

She could hear their low, steady hum; it seemed so near that they must be at work in the mignonette-bed under the window; or her senses, perhaps, were unnaturally sharpened. Ah! one had flown in through the window—then two or three. She saw them darting to and fro, heard their half-angry drone through the throbbing of the pulses in her ears, through the thudding of her heart.

'Well?' Corfield's voice came, harsh and grating. 'Do you realise *now* that you are not free—that I have you in my power?'

Suddenly, frantically, Jacqueline began to struggle. She wrenched her wrist away, but

before she could reach the open window Corfield had caught her again, forced her back against the wall, his eyes ablaze, his face working.

'You shall not escape me!' he snarled. 'You—ah!'

The words ended in a fierce oath. He released Jacqueline's arm, and clutched at his throat. As he did so a bee rose in the air, with an angry buzzing sound.

'It's stung me—damn the brute!' he ejaculated, and made a frantic grab at the insect as it darted away. His violently outflung hand encountered another bee. Next instant it had left its sting in his wrist.

And then—it seemed to Jacqueline, cowering against the wall, as though, in a moment, the garret—the whole air—was full of darting insects, full of the whirring, angry drone of a vast army of bees.

Thicker and thicker they poured in through the window; they hung in clouds, clustered over the shelves, walls, and furniture—wheeling, darting—and ever they gathered more and more thickly round the figure of the man who struck out at them, thrashing on all sides with his arms, cursing them in a hoarse, inhuman voice.

The temper of that fierce legion of insects was stirred; venomously, vindictively, they attacked this stranger who assailed them. In hundreds and thousands, in numbers which grew each instant, they hung about him, gathered on his clothes, his hands, his head. . . . Already his face was almost unrecognisable—swollen, scarlet—

'Vincent, Vincent, stand still.' Wholly regard-

less of her own safety, Jacqueline sprang forward and gripped him by the arm. 'Don't strike out at them like that; don't excite them! Keep quiet—stand still—ah, don't you hear me?'

But he was far past hearing or heeding her. He broke away, hitting out in all directions, spitting out oaths, beating at the air and at those fierce legions which darkened the air, those swarming thousands whose mighty instincts he had dared to cross, to hamper.

All Jacqueline's protests and efforts were unavailing. She could not restrain or calm the maddened man—could not beat off the furious insects, which, even in their rage, seemed to recognise the girl, so that she escaped almost scatheless.

It was not until at last Corfield sank down, exhausted, upon the ground that she was able to help him, to tear down a muslin curtain and fling it over him, whilst she fetched all the remedies and alleviations which her skill and knowledge could suggest.

But there was little really to be done. The man was unconscious already, sinking deeper and deeper into that merciful coma which would end only beyond the gates of Death, and release his twisted, warped spirit from the tortures imposed by its own bodily nature.

The bees, unconscious winged Avengers, had finished their work with a terrible completeness. Only a few stray insects now darted here and there about the room; whilst the others clung together, filling the air with their steady, relentless drone, in a huge, shapeless mass, under the low rafters of the attic, where they had swarmed.

A BYWAY IN BRITISH EAST AFRICA.

By H. B. PATERSON.

THERE had been a serious drought in our coffee district—a drought so prolonged as to cause us serious financial misgivings, and to imperil the fair fame of British East Africa as possessor of 'the perfect climate of the world.' Fearing something of the sort, I had done some mild irrigation, and so saved some of the young coffee, which otherwise would have been entirely done for; and, irrigation being much in my mind, I decided to pay a flying visit to a man who had been doing quite good things with it. This took me to a part of the country which is little known, though right on the railway, the station being Makindu, about 120 miles from Nairobi, on the way to Mombasa. The reason why few people know it except by name is that the region is reputed to be exceedingly unhealthy, although it really is not—if you take reasonable precautions. However, it is only about 2200 feet above sea-level, and everything under 4500 feet is considered impossible locally.

I had been rather seedy recently with fever,

but knew that, once out of Nairobi, wherever I went, I should feel better; and so it proved. We crossed the Athi River about thirty miles above my farm, and ran through sun and wind across bare plains to Kiu, where, in the usual leisurely manner of the Uganda Railway, the mail-train stops for half-an-hour, while the passengers gobble tea and eggs and bread-and-butter in the Dak Bungalow. Then more plains and clouds of red dust, so thick and suffocating that we had to shut all the windows and stew in an atmosphere that reminded one of a greenhouse that had been used for a 'pub.' We reached Makindu at 7.30 p.m., and there I met the man I had come to see, an American named B—, the only white land-owner in the district or within fifty miles.

Makindu is a relic of past glories these days. In the caravan-times it was a great spot; when you pulled in there you were one-third of the way from the coast to the Lakes—the Taru desert and the long waterless stages behind you. In the days of the building of the railway it was

also a great place, and a huge station was built; but now it is just a patch of deserted civilisation in the middle of a vast wilderness. There are great empty locomotive-sheds, and dozens of stone-built houses, and silence over all; but it is said that Makindu is to become the distributing centre for the Magadi branch line, so it may revive. There are occasional white engineers there, but they usually start drinking about 9 A.M., and are apt not to last long.

I slept at the station, and early next morning walked out to B——'s place, about two and a half miles through the scrub, or rather bush. This is the real bush country, with fair-sized trees and heavy undergrowth. In it you find all the big game of Africa, except elephant; rhino are about as numerous as hares at home, and I had my eye on convenient trees all the time I was there. The country looks dead-flat, with this thick bush all over it, and here and there little conical hills sticking up, the whole always covered with the queer blue haze that marks tropical African bushland. South-east it runs away to the sea; north-west it is bounded by the hills that buttress the highlands. To the south rises Kilimanjaro; to the north lie plains that stretch away to Abyssinia—and you might journey ten times there and back and never see a white man. But it is Kilimanjaro that dominates the whole scene, an enormous snow-capped mountain-ridge that seems to float in the air high above all the world around it. By some queer process, partly mirage, partly haze, the lower 10,000 feet or so fade away into the sky, leaving the upper half clear and apparently unsupported. Makindu is ninety miles from the mountain, yet it is impossible to get away from it. In a little clearing in the thickest bush, where one would imagine that all you would see would be the sky immediately above, you find the glittering white dome looking down on you. Personally I didn't want to get away from it; I couldn't take my eyes off it all the time it was in sight.

B——'s place consists of a 180-acre clearing in the bush, bounded by the Makindu River on one side. By some mysterious means (which he described as the devil looking after his own) he has got Government permission to use the whole flow of the river for irrigation, &c., which permission has turned a place worth nothing into a good paying concern. This region has a very small rainfall, and without irrigation the rich soil is useless—some Indians tried onions, but gave it up as they relied only on rain. The river comes from Kilimanjaro, an inexhaustible reservoir, and the water is charged with sulphate of magnesia (Epsom salts), which is a valuable manure. Where it has overflowed the land and evaporated, a white crust is left. B—— grows onions mainly, and a very good thing he makes out of it, I believe.

We went shooting the second day I was there,

looking for oryx and lesser kudu, but naturally, these being our special object, we saw every other sort of game except them. However, we, or rather B——, had something of an adventure. The boys said there was a rhino in a patch of thick bush, and B——, who is 'dead nuts' on rhino, because they roll on his onions, insisted on going in after it. He had a double-barrel .577 Express, a cannon I could hardly lift, and wouldn't have fired for the Mint. I had my 9 mm. magazine Mauser. He suggested my coming in also, to which I replied that the poor wee beast would probably be frightened enough already, and that, as an F.Z.S. (Scot.), I wouldn't be a party to increasing its terrors. I said I would wait outside, near a tree, and pick him off the horns when I had time. B—— went in—bush very thick—couldn't see the rhino. He crawled about, and presently saw a small black patch—part of the rhino, but what part he couldn't tell. He moved a little to try to find out, and immediately heard a crash and a rush on his right. He turned and saw another rhino charging him about thirty yards away. He fired, and as he fired felt, rather than heard, another rush behind him, swung round without seeing if his first shot had killed, and found a third rhino right on top of him. He fired his second barrel and killed it within five yards! The other rhino which had charged him was also dead, and the original cause of all the trouble had, fortunately, cleared off. B—— declared that the little affair proved the value of going about with a cannon like his, but I saw in it only another proof of the foolishness of going into thick bush after dangerous game instead of beating it out. An Express rifle is like a shot-gun, with only as many shots as you have barrels; these emptied, you have to reload. If the third rhino had charged B—— before he had had time to reload, his only chance would have been a tree, howitzer or no howitzer.

On the third day I found myself at the station again, looking for a train back. There was no passenger train till next day midday, but a goods was due at 11 A.M., and I decided to go by it. We started. I was prepared again to face the red dust of the down journey, but I needn't have worried. We never went fast enough to raise any. Several times I found we were doing under two miles an hour for long stretches, and once I walked ahead of the train, then sat down and waited for it. Occasionally we knocked up a giddy ten miles an hour, but that was exceptional. But the rate of going did not worry me; in fact, it pleased me. I sat on the foot-board and watched Kilimanjaro. I watched it from 11 A.M. till sunset and didn't get bored. Meanwhile the long red train crawled across the veld, gradually drawing up to the highlands, and rising slowly all the time. Some low hills, with Kilimanjaro floating in the light clouds above them, were to the south of us, and northwards the veld sloped gradually to the far-off Athi River.

Beyond the Athi were a few low blue hills, showing vaguely in the haze, part of that unexplored tract lying between the Athi and the Tana. North and east the view was terminated by distance only.

The whole country was as it has been from the beginning—not a clearing, not a native hut, not even a native to be seen. It was primitive Africa, so primitive that the single-track railroad was too insignificant a sign of civilisation to be noticeable, far less obtrusive. It was Africa in her most attractive garb for that very reason, for she loses her charm precisely in proportion as she gains civilisation.

We stopped at Simba, Sultan Hamoud, and at little clearings where noisy imported Kavirondos load the engine with wood and water, and shout '*Quahiu!*' ('Farewell!') as you steam out.

It was getting on by now, and as we crept in amongst low hills we met a few railway workers going home along the track—Kavirondos most of them. They ran alongside the track, and I shouted insults, to their great joy, the insulted

one calling, '*Eh—h! Hapana, hapana*' ('Not so'), and all his pals, '*Iuchle, bwana*' ('Quite true, master')—I had told him that with a figure like his he should roll, not run.

Presently Kilimanjaro had to go to bed, and we said good-night, he blushing brightly as he did so. I suppose he was ashamed of going to bed at such an early hour at his age. Then it grew dark, and when we reached Kiu at 2 A.M. I was cold and bored and hungry. Kiu is fifty miles from M——, and we had taken nine hours for the run!

At Kiu I got eggs and bread-and-butter. After spending some chilly and mosquito-haunted hours in the station there, I went on by mail-train next day. The last part of the trip had none of the charm of the first; it was mainly across the Athi and Kapote treeless spaces, covered with long yellow grass, and beloved of game. There were the usual herds of wildebeest, ostriches, Tommies (small gazelles), zebras, &c., but all passed too quickly for more than a glimpse. And so back to dusty Nairobi again.

THE PARTS MEN PLAY.

CHAPTER XV.—*continued.*

II.

IT was after nine o'clock when Selwyn woke from a deep, refreshing sleep. Hurrying into the other room, he found no sign of his guests.

'When did these gentlemen leave?' he asked of his servant, who had answered his ring.

'It must have been about six o'clock, sir. I heard the door open and shut then.'

'Why didn't you call me?'

'I wasn't wanting to disturb you, sir. It's the first good sleep you've had for a long time.'

It was true. The sinking of himself into the personality of another man had released the fetters of his intensive egotism. For a whole night he had forgotten, or at least neglected, his world-mission in simple solicitude for one who had fallen by the wayside.

After the stimulus of a cold shower and a hearty breakfast, he resumed his crusade against the entrenched forces of Ignorance, but in spite of the utmost effort in concentration, the memory of the lonely figure by the Thames intruded constantly on his mind. It was not only that Dick was the brother of Elise—although Selwyn's longing for her had become a dull pain that was never completely buried beneath his thoughts; nor was it merely the unconscious charm possessed by the boy, a charm that seized on the very heart-strings. To the American the real cruelty of the thing lay in the existence of a Society that could first debase so fine a creature, and then make no effort to retrieve or to atone for its crime.

Putting aside the day's work he had planned,

he flung his mind into the arena of England's social conditions. Exerting to the full his gift of mental discipline, he rejected the promptings of prejudice and of sentiment, and brought his sense of analysis to bear on his subject with the cold, callous detachment of a scientist studying some cosmic phenomenon.

For more than an hour his brain skirmished for an opening, until, spreading the blank sheets of paper before him, he wrote: '*THE ISLAND OF DARKNESS.*' Tilting his chair back, he surveyed the title critically.

'Yes,' he said aloud, squaring his shoulders resolutely, 'I have generalised long enough. Without malice, but without restraint, I will trace the contribution of Britain towards the world's *débâcle.*'

With gathering rapidity and intensity he covered page after page with finely worded paragraphs. He summoned the facts of history, and churning them with his conceptions of humanity's duty to humanity, poured out a flood of ideas, from which he chose the best. Infatuated by the richness of the stream, he created such a powerful sequence of facts that the British began to loom up as a reactionary tribe fighting a rearguard action throughout the ages against the advancing hosts of enlightenment. The Island of Britain, the 'Old Country,' as its people called it, began to shape in his eyes like a hundred-taloned monster sprawling over the whole earth. This was the nation which had forced opium on China, ruled India by tyranny, blustered and bullied America into rebellion, conquered South

Africa at the behest of business interests. . . . Those and endless others were the counts against Britain in the open court of history.

And if those had been her crimes in the international sphere, what better record could she show in the management of human affairs at home? She had clung to the feudal idea of class distinction, only surrendering a few outposts reluctantly to the imperious onslaught of time; she had maintained a system of public schools which produced first-class snobs and third-rate scholars; she had ignored the rights of women until in very desperation they had resorted to the crudities of violence in order to achieve some outlet for the pent-up uselessness and directionlessness of their sex; she had tolerated vile living conditions for the poor, and had forced men and women to work under conditions which were degrading and an insult to their Maker. . . . One by one these dragons reared their heads and fell to the gleaming Excalibur of the author.

Selwyn made one vital error—he mistook facts for truth. He forgot that a sequence of facts, each one absolutely accurate in itself, may, when pieced together, create a fabric of falsehood.

There were many contributing influences to Austin Selwyn's denunciation of Britain that morning. Although he had ordered sentiment and prejudice to leave his mind unclogged, these two passions cannot be dismissed by mere will-power—the drawing of a blind does not expel the warmth of the sun, although it may exclude the light.

He was keenly moved by the meeting with Dick Durwent, and, almost unknown to himself, his love for Elise was a smouldering fever whose fumes mounted to his head. Love is so overpowering that it overlaps the confines of hate, and his hunger for her was mixed with an almost cave-man desire to conquer her, force homage from her. And she was English!

In addition to these undercurrents affecting his thoughts, there was the dislike towards England which lies dormant in so many American breasts. Gloss it over as they will, no political *entente* can do away with the mutual dislike of Americans and Englishmen. It is a thing which cannot be eradicated in a day, but will die the sooner for exposure to the light, being an ugly growth of swampy prejudice and evil-smelling provincialism that needs the darkness and the damp for life.

Mingling these subconscious elements with those of logic and reason, Selwyn wrote for two days, almost without an hour's rest, and when it was finished *The Island of Darkness* was a powerful, vivid, passionate arraignment of England, the heart of the British Empire. It was clever, full of big thoughts, and glowed with the genius of a man who had made language his slave.

It lacked only one ingredient, a simple thing at best—*Truth*.

But that is the tragedy of idealism, which studies the world as a crystal-gazer reading the forces of destiny in a piece of glass.

III.

A week later, in the early afternoon, Selwyn was going up Whitehall, when he heard the sound of pipes, and turned with the crowd to gaze. With rhythmic pomposity a pipe-major was twirling a staff, while a band of pipes and drums blared out a Scottish battle-song on the frosty air. Following them in formation of fours were five or six hundred men in civilian clothes, attested recruits on their way to training-centres.

With the intellectual appetite of the psychologist, Selwyn looked searchingly at the faces of the strangely assorted crowd, and the contrasts offered would have satisfied the most rapacious student of human nature.

His eyes seized on one well-built, well-groomed man of thirty odd years whose slight stoop and cultured air of tolerance marked him a 'Varsity man' as plainly as cap and gown could have done. Just behind him a costermonger in a riot of buttons was indulging in philosophic quips of a cheerfully vulgar nature. A few yards back a massive labourer with clear untroubled eye and powerful muscles stood out like a superior being to the three who were alongside. Half-way a poet marched. What form his poesy took—whether he expressed beauty in words, or, catching the music of the western wind, wove it into a melody, or whether he just dreamed and never told of what he dreamed—it matters not; he was a poet. His step, his dreamy eyes, the poise of his forehead raised slightly towards the skies, were things which showed his personality as clearly as the mighty forearm or the plethora of buttons bespoke the labourer or the costermonger.

With a great sense of pity the American watched them pass, while the skirl of the bagpipes lessened in the distance. In spite of the dissimilarity of type, there was a community of shyness that embraced almost every one—a silent plea not to be mistaken for heroes. As they passed the Horse Guards and saw the two sentries astride their horses still as statues (their glorious trappings, breastplates, helmets, and swords, the embodiment of spectacular militarism) an apologetic, humorous smile was on the face of almost every recruit. The sight was a familiar enough one to the large majority, but in the presence of those grim, superb cavalrymen they felt the self-conscious embarrassment of small boys about to enter a room full of their elders.

In its own way it was Britain's mob saying to Britain's regulars that it was to be hoped no one would think they imagined themselves soldiers in the real sense of the word.

But to Selwyn the noise of their marching feet on the roadway had the ominous sound of

the roll of the tumbrils, bearing their victims to the guillotine.

The procession was nearly ended and he was about to turn away, when his eye was attracted by a peculiar pair of knees encased in trousers that were much too tight, working jerkily from side to side as their owner marched. Although his face was almost hidden by reason of his vagabond hat being completely on one side, it was not difficult to recognise the futurist, Johnston Smyth. He appeared to be in rare form, as an admiring group of fellow-recruits in his immediate vicinity were almost doubled up with laughter, and even the grizzled Highland sergeant marching sternly in the rear had such difficulty in suppressing a loud guffaw that his face was a mottled purple.

And marching beside the humorist, with a slouch-cap low over his eyes, was the lad who was known as 'Boy-blue.'

IV.

As this tale of the parts men play unfolds itself a passing thought comes.

From the standpoint of fairness, economics, and efficiency, conscription should have been Britain's first move. But nations, like individuals, have great moments that reveal the inner character and leave beacons blazing on the hills of history.

In a war in which every nation was the loser, Britain can at least reclaim from the wreckage the memory of that glorious hour when the Angelus of patriotism rang over the Empire, and men of every creed, pursuit, and condition dropped their tasks and sank themselves in the great consecration of service.

What is the paltry glory of a bloody victory or the passing sting of a defeat?

War is base, senseless, and degrading—that was one truth that Selwyn did recognise; but what he failed to see was that in the midst of all the foulness there lay some glorious gems. When battles are forgotten and war is remembered as a hideous anachronism of the past, our children and their children will bow in reverence to that stone set high in Britain's diadem—THEY SERVED.

(Continued on page 343.)

HOLLAND—A LAND OF SMOKERS.

HOLLAND has been defined as an immense crust of earth floating on the water. Certainly, when one considers the nature of the country, such a definition is quite an intelligible one. Bog and moor constitute a large part of the land, while such rivers as the Scheldt, the Maas, the Lek, and the Waal all guide their lazy waters through the fertile domains. A network of canals intersects the country everywhere, and the sea has made grievous inroads upon the coast—witness the Zuider Zee.

It is not surprising, therefore, that Holland should have a humid climate. Indeed, the climate is of such a damp nature as to necessitate (in the opinion, at all events, of the male inhabitants) the use of the pipe and the cigar. Thus the Dutch have gained the reputation of being, as a race, the heaviest smokers in northern Europe, if not of the whole Continent. Tobacco and cigars are very cheap in Holland, and men and boys alike take full advantage of their cheapness. It is very seldom that a Dutchman is seen without his pipe or his cigar. At home or at business, in the workshop or in the street, Mynheer is to be seen wafting clouds of cigar or tobacco smoke. It is not an uncommon occurrence for a Dutchman to fall asleep with his pipe set firmly between his teeth, only to awake and relight it as if nothing unusual had happened. Smoking, it would seem, comes as a second nature to him.

One can imagine the novelty of working as one of a staff of forty workmen, each going

his hardest at a cigar-stump or an amber pipe. Yet such is quite a common sight in Holland.

On entering a Dutch home one is immediately supplied with a cigar. On leaving, one's cigar-case is filled. This is considered an act of necessary politeness.

In a Dutch town one cannot fail to be impressed by the number of tobacco-shops which abound everywhere. They are to be found almost at every turn, and in them all kinds of cigars are procurable. One writer has described the Dutch tobacco-shops as the finest in Europe.

Not a few attacks have been levelled at smokers from the pens of able men, and among the many objections to smoking which these men have presented is that tobacco dulls the intelligence. If this is the case, it has certainly failed to take effect upon the people of Holland, for it would be a difficult task to name a people possessed of an intelligence more clear and comprehensive.

There is a very interesting story current in Holland of an old gentleman, Mynheer van Klaes by name, who is said to have smoked one hundred grammes of tobacco per day. He was possessed of a large fortune, and had travelled extensively in all parts of the world. During his travels he had made a point of obtaining specimens of every kind of pipe which he came across. Thus he had a very valuable collection. On his return he built a beautiful palace near Rotterdam, in which he

deposited his pipes. This he opened as a public museum. He took great pleasure in displaying his vast collection to crowds of interested visitors, to each of whom he presented a catalogue bound in velvet, and a supply of tobacco and cigars.

Van Klaes died at the age of ninety-eight. A few days before his death he made out his last will and testament, which, because of its interest, I quote below.

'I desire that all smokers in the country shall be invited to my funeral, by all possible means—newspapers, private letters, circulars, and advertisements. Every smoker who accepts the invitation shall receive a gift of ten pounds of tobacco and two pipes, upon which shall be engraved my name, my arms, and the date of my death. The poor of the district who follow my body to the grave shall receive each man, each year, on the anniversary of my death, a large parcel of tobacco. To all those who attend the funeral, I make the condition, if they wish to

benefit by my will, that they shall smoke uninterruptedly throughout the duration of the ceremony. My body shall be enclosed in a case lined inside with the wood of my old Havana cigar-boxes. At the bottom of the case shall be deposited a box of French tobacco called "caporal," and a parcel of our old Dutch tobacco. At my side shall be laid my favourite pipe and a box of matches, because no one knows what may happen. When the coffin is deposited in the vault, every person shall pass by and cast upon it the ashes of his pipe.'

Mynheer van Klaes's last will and testament was carried out to the minutest point. People came to the funeral from the remotest parts of Holland. The funeral was a beautiful one. Wreathed in a huge veil of tobacco and cigar smoke, the procession of mourners wended its way to the last resting-place of its virtuous benefactor, whose name has become a household word in that good little country of Holland.

THE MONTH: SCIENCE AND ARTS.

THE NOISELESS TYPEWRITER.

FEW sounds are more nerve-racking than the clatter of typewriters, especially to those, including the typists, who have to listen to them all day. It is not surprising, therefore, that many efforts have been made to eliminate this drawback. Little success was attained until the problem was tackled by a Canadian, Mr W. P. Kidder, with the result that a machine has been evolved known as the 'Noiseless Typewriter.' This appliance is almost silent, only a faint clicking noise being audible. What makes the ordinary typewriter so noisy is the constant succession of hammer-blows given by the type upon the platen roller. When a key is pressed down the type and the sliding frame carrying it shoot out with constantly increasing speed until pulled up with a snap on the paper. In the noiseless typewriter this rate of motion is reversed, the sliding frame travelling fast to begin with, and more and more slowly during the remainder of the stroke, until it has almost stopped by the time the surface of the paper is reached. Just at this point a tiny weight, which, brought into action automatically, has been gathering momentum during the stroke, comes into play, and presses the type forward. It is impossible to explain the mechanism without the aid of a diagram; suffice it to say that the effect of its working is to produce a strong pressure and to ensure perfect registration on either one or more copies. One great advantage of the new machine is the practicability of using a steel platen roller, which cannot be dented, and will, therefore, never need renewal. The faces of the

type-bars, being protected from violent collision, will always produce a perfect impression; and, as the type-bar is locked at the printing-point, vertical or lateral displacement is impossible, and permanent type-bar alignment is assured. As the type is pulled up by its own mechanism at a certain point, adjustment is provided to allow for different thicknesses of paper or for making a number of carbon copies. In addition to the improvement in the type-operating mechanism, very careful attention has been given to all other points where rattling can take place, with the result of almost complete noiselessness, as already stated; while the machine embodies first-class workmanship with a high degree of finish.

COMMERCIAL FLYING IN BAD WEATHER.

In a lecture to the Royal Aeronautical Society on 'Flying over Clouds in Relation to Commercial Aeronautics,' Professor Melville Jones, Professor of Aeronautical Engineering at Cambridge University, made some interesting references to the difficulties of air navigation under certain conditions, and the instruments and organisation needed for overcoming them. According to the lecturer, flying over a practically continuous layer of cloud 'could become little inferior for commercial purposes to fine-weather flying,' given the help of a large organisation and special apparatus. He suggested (1) 'the continuous determination of the wind above the clouds, and of the height of the top of the latter;' (2) 'the laying down of wireless control-stations at and between termini on the main routes;' (3) 'the provision of the necessary instruments for cloud flying and "dead reckoning," and the

training of pilots in their use.' When flying in clouds it is extremely difficult for the pilot to know when he is turning, or, under certain conditions, whether he is even right way up. To aid him in such circumstances an instrument is used known as the 'static head-turn indicator,' which registers the wind-pressure at each wing-tip. If, for instance, the machine is turning to the left, the right wing will be moving faster through the air than the left, and the instrument indicates this state of things by the difference in air-pressure at the wing-tips. Another instrument mentioned by the professor is based on the tendency of the spinning-top to remain upright under any conditions, and to indicate if the machine is tilted; hence the pilot can restore his machine to a level position by following with his control-lever the movements of a prolonged axis of the top. Lastly, the professor mentioned the 'gyroscope turn-indicator,' which 'shows the attitude of the machine whatever the conditions, and has the advantage of simplicity and of being almost instantaneous in its action.'

A TIME-RECORDER FOR MOTORS.

We live in an age of mechanical checks upon human actions, and the scope of these devices is constantly extending. When entering a modern factory each employee inserts his numbered key in a time-recorder and gives it a turn, thus recording the exact minute at which he arrives. Similarly the night-watchman registers the times of his passing certain points where instruments are provided for this purpose. One of the latest inventions in this direction, known as the 'Servis Recorder,' has been devised for the purpose of showing at the end of each day the time spent, in running and standing respectively, by commercial road vehicles, such as trams, motor-buses, and motor-lorries. The principle upon which the instrument works is very simple. A clock forms, of course, an essential feature, as in all time-recording devices. Its function is to revolve a paper disc, which is marked similarly to the face of a twenty-four-hour clock, but with each hour divided into intervals of ten minutes. The only other moving part is a pendulum, of which the swing is confined within small limits by a rubber buffer. However smooth a road, or even a tramway track, the side-swaying of any vehicle is enough to set the pendulum swinging, the movement being rapid owing to the resiliency of the rubber buffer. Near the fulcrum of the pendulum is a brass stylus with a sapphire point which bears lightly upon the revolving paper disc. The disc is blue in colour, and is coated with a film of wax. When the vehicle is running the movement of the pendulum causes the stylus to cut away the wax and expose the blue surface of the paper in a broad line; but should the vehicle be standing still, the stylus merely makes a thin line as the disc is turned by the clock. A new paper disc is put on every

day, the old ones being kept as a record. The mechanism is contained in an aluminium case with a hinged lid, which has a rubber joint to keep out dust and moisture, and with a padlock to prevent unauthorised interference. As the recorder measures only $6\frac{1}{2}$ inches by $5\frac{1}{4}$ inches, a place is easily found for it on any vehicle; any spot will do where it can be secured by two bolts provided for this purpose. It will be noted that there is no pen to be filled with special ink, the only attention required being the changing of the paper discs and the winding of the clock. Although this instrument will show up a lazy driver most effectively, it was primarily designed to indicate where delays or stoppages occur for which other parties are responsible, and which it may be possible to eliminate or lessen by improved organisation.

AN IRONING-MACHINE FOR THE HOME.

Ironing still remains an irksome domestic duty in spite of the relief from the ancient flat-iron afforded by irons heated by means of gas or electricity. A machine which will do the work quickly and satisfactorily, therefore, should be welcome in every household where the washing is done at home. Side by side with the washing-machine described last month as having been shown at the Ideal Home Exhibition was the 'Thor' electric ironer, which will iron anything, from a lady's handkerchief to the largest sheet, in a fraction of the time it would take to go over it with a flat-iron. The essential parts of the appliance are a canvas-covered steel roller and a heated shoe which presses up against it. In front of the roller is fixed a flat board, upon which the articles are pushed in between the top of the roller and the shoe until they are gripped by the roller and carried round, to come out below, beautifully ironed. The roller is rotated by a little electric motor, and the shoe is heated by gas or gasoline. It may be noted that, the heat and the pressure being always the same, the results are much more uniform than with hand ironing. The makers claim that the machine can be operated for an hour at a total cost for electricity and gas of three-halfpence. This figure the writer had no means of checking, but he can vouch for the ironing being done quickly and well. Three sizes of machine are made, the rollers being 38, 44, and 50 inches in length respectively. The largest, therefore, will take a 100-inch sheet if doubled. A most advantageous feature of the apparatus is the mounting of the shoe in such a manner that it can be withdrawn from the roller to the extent of 4 inches to facilitate cleaning and polishing.

AN ARMoured UNPUNCTURABLE TIRE.

There is little doubt that the device described in this note would render motor-car tires unpuncturable, but for how long and whether at the cost of other serious drawbacks, such

as overheating or excessive wear, can be demonstrated only by experiments on the road, which do not appear to have been carried out up to the time of writing. The invention, which has been patented by Thomas C. McEwen, of Caldwell, New Jersey, consists of steel armour between the outer tire and the air-tube. This armour closely resembles the articulated plates to be found on the tails of lobsters and other crustaceans, a series of overlapping semi-cylindrical plates forming a steel ring between the tread of the tire and the inner tube. This ring is quite flexible, yielding to the travelling indentation of the tire as it makes contact with the ground. Each semi-cylindrical plate is about as long as it is wide, and one end (the larger) fits outside its neighbour on one side of it, while the other end (the smaller) fits inside its neighbour on the other side. The larger end contains a slot at each side; the smaller, a corresponding hook; and the plates are linked up by inserting the hooks of one plate into the slots in the next. In this way a complete tube of the requisite length is formed. A ring of holes is made round each side of the outer tire to admit air for the purpose of cooling the armour, dust and grit being excluded by fine metal gauze. Further ventilation is provided for by air-tubes through the felloe and the rim. If successful, this form of armouring for tires should cost very little, as the individual plates could be stamped by the million in automatic machines.

COMPILING CENSUS RETURNS BY ELECTRICITY.

That an enormous amount of work is involved in the taking of a census and the after manipulation of the figures will be easily realised by all, and it is only natural that mechanical appliances should have been devised to expedite the tabulation and classification of the results. So early as 1890 machines were brought into use for the United States census of that year, whereby a saving was effected of nine-tenths of the time taken to carry out the work by hand and two-thirds of the cost. 'Profiteers having secured control of these valuable machines,' says the *Scientific American*, 'the Director of the Census employed experts to invent electrical machinery for the work,' with the result that half-a-million dollars were saved at the next census. Since then various improvements have been made, and the machines employed for the census of 1920 are wonderfully efficient. The particulars, as received on the census forms, are transferred to cards, the sex, age, race, and other items being correctly indicated by punching holes in certain spaces. This work must, of course, be controlled by hand, but the actual punching is done by machines, an army of clerks being able to deal with four million cards a day. The punched cards are fed automatically to the tabulating-machines, each of which is capable of

recording and enumerating 24,000 cards an hour. A blunt needle passes through the punched holes and makes electrical contact in a cup of mercury, thus closing the circuit and operating the recording mechanism. These machines add up and print the totals for the various towns, counties, and states, and each card is passed through six times to tabulate the different particulars. In addition to the tabulating-machines, which stop when an insufficiently punched card is encountered, there are others which sort the cards into any number of groups up to twelve, according to the facts indicated by the punched holes. Each of these machines is capable of sorting cards at the rate of 320 a minute, and rejects those showing impossible combinations.

ALARM-BELLS RUNG BY WIRELESS.

Wireless telegraphy has proved a veritable godsend to vessels in distress, which are able to notify ships within range of their urgent need of assistance. Until the advent of apparatus recently devised by the Marconi Company, however, it was necessary that an operator in each ship—if all such signals were to be detected—should listen continuously by means of the usual headpiece. The new transmitting device is capable of ringing alarm-bells in ships within range, whereby attention is at once attracted, whether an operator is listening or not. At a demonstration of the apparatus at the Marconi Works, Chelmsford, bells were rung, flashlights were lit, and a charge of gunpowder was exploded by a transmitter at Shelford near Cambridge, thirty miles distant. When vessels are fitted with the apparatus, the pressing of a key will cause alarm-bells to ring in all ships so equipped within an eighty-mile range of the transmitter, a special emergency signal being sent out to which only the special receivers will respond.

BOSUN-BIRD ISLAND.

A correspondent sends us from Ascension the following description of a visit to Bosun-Bird Island, a tiny, remote portion of the British Empire, seldom trodden by the foot of man: 'On a cloudless morning we left the pierhead by steam-pinnace for Bosun-Bird Island, which lies some five hundred yards to the north-east of the main island of Ascension. Shortly after our getting under way lines were cast astern with lures attached, for we hoped to catch enough fish for luncheon on the outward journey. The coast-line is quite interesting, and, though devoid of vegetation, is much varied in colour, due to the different kinds of volcanic strata and crystals thrown up when the island was in eruption. Numerous sea-caves are to be seen, and blow-holes through which the sea is forced up by air-pressure to a great height, with a sound like the blowing of gigantic whales. In one case sand alone is blown up into the air, and a miniature mountain of sand is piled behind the entrance of

the blow-hole. Rounding North-East Bay, we ran into a shoal of cavally. All lines were immediately taut, and several large fish were hauled on board, and despatched with a belaying-pin. We were now followed by a school of porpoise, and a huge shark showed his dorsal fin at intervals as he followed in our wake. Many more fish were caught before we ran into smooth water between the two islands and cast anchor. The sky overhead was now almost obliterated by bird-life. Myriads rose from Bosun-Bird Island, and the air was deafening with their cries. Bosun-birds floated high overhead, their two long tail-feathers giving them the appearance of minute aeroplanes as they hovered in the air. Three of us now left in a dinghy to explore the island. The landing was somewhat perilous, as the rocks are overhanging, and we were forced to climb up an old rope of doubtful calibre tied to the cliffs some years ago by kindred spirits. The climb to the top of the island (five hundred feet high), though not difficult, had to be carefully done, as we met with many loose boulders, and were constantly pecked at by sea-birds nesting in holes in the sides of the cliffs. Reaching the top of the island, which is practically flat, we were rewarded with a wonderful sight. The surface was inches deep in guano; innumerable birds were nesting on eggs or feeding their young; and the ground was strewn with the remains of flying-fish, which seem to be the chief diet of the feathery multitude. Frigate-birds with blood-red pouches beneath their bills, gannets, boobies, noddies white and black, predominated. The bosun-birds were found nesting under small rocks in holes. Their eggs are enormous for such a small bird to lay, and are chocolate-coloured. We collected some eggs for specimens, and eventually descended in safety, with the minor casualties of a few broken eggs. Boarding the pinnace again, we found the seamen had caught numerous large cod and conger-eels. The fragrant smell of fried fish quickened our appetites, and we sat down to an excellent lunch, washed down with glorious beer. The return journey was somewhat rough, and a goodly number of us suffered in consequence. However, once again on *terra firma* and all was well, a unanimous vote being passed that we had had an excellent day, spent away from the monotonous routine of the island-warship *Ascension*.

FIREPROOF PAINT.

The war has involved the destruction of so large a part of the world's wealth that it is specially incumbent upon the present generation to do all in its power to prevent further destruction. Apart from the devastating effects of war, perhaps the most powerful destroying agent of material wealth is fire, and anything, therefore, which assists in giving immunity against this dread scourge is to be heartily welcomed. There

has recently been placed on the market a form of paint, two coats of which applied to woodwork render it, for all practical purposes, non-inflammable. It can be had ready for use in a variety of colours, and admits of the application of varnish or enamel as a final coat without lessening in any way its fire-resisting qualities. The favourable impression made by our own experiments is confirmed by the offer of at least one insurance company to make a substantial reduction in its fire insurance premiums where wooden buildings are protected by this paint, by an official test carried out by the Technical Department of the Air Board, and by the recommendation of the consulting engineers to the promoters of the Ideal Home Exhibition that all exhibitors should be asked to use this material wherever possible, as it afforded a substantial measure of protection against fire.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

SPRING-TIME.

AMBER and gold for the early year,
Jonquils aglow in their gayest gear,
Primroses shyly showing—
Yellowbreasts stooping to hear the sound
Of the Spring awake in the pulsing ground,
And trumpet daffodils blowing.

Dainty violets nodding their heads
At friendly neighbours in garden-beds,
And tulips bowing to greet them—
Mimosa too, with her honied tips,
Showering kisses from laughing lips,
And lilies crowding to meet them.

Flowers in plenty for you and me,
Buds a-throb on the apple-tree,
And purple hyacinths showing;
Bluebells weighted with glistening dew,
Is it their chiming I'm list'ning to?
Or trumpet daffodils blowing?

Spring of the year, what a wealth you give!
Oh, surely this is the time to live
While all that is good is growing—
And the time to rest in the quiet ground
Is when the bluebells are chiming round,
And trumpet daffodils blowing.

MILLE BOMBES!

THE STORY OF PÈRE PROSPER.

By WALTER SHAW SPARROW.

CHAPTER I.—IN THE BRUSSELS ACADEMY.

WHEN the evening classes broke up, students thronged excitedly to their quadrangle and formed a double line into La Rue du Midi. Their talk was loud, and frequently the word *Anglais*, with an offensive epithet before it, sounded out from their shrill noise.

They were aflame because of a fight in class. The only Englishman in their midst, Wilfrid Crowley, a lad of nineteen, had come to blows with red-haired André Fossé, a fop of six-and-twenty, who kept his long beard odious with patchouli, and who took pride in himself, also, as a sleek ironist. Fossé and Crowley sat side by side in the Figure Antique, and their quarrel arose out of Paardeberg, concerning which the world's newspapers were saying a great deal, with help from many shrieking headlines. Continental sympathy had chosen the Boer side, and in Belgium public opinion was particularly hot and strong, as the South African Dutch were regarded as kinsmen by the Flemings. Crowley understood this feeling, but Fossé went much too far, putting insult after insult into his remarks on British policy.

A fight in class was a breach of discipline hitherto unknown, and this one began so rapidly that students looked on in amazement till Fossé, knocked out by a straight left, lay huddled below a plaster figure of the Medici Venus. Then a rattle of anger spread from class to class. Professors came and held an inquiry; they blamed both combatants in order to arrive at peace by a short cut; but good-tempered justice had no effect. Anger continued in whispers while work-time lasted. Afterwards in the quad an ugly ragging mood was astir.

Crowley stopped for a brief talk with his professor, who spoke always in undertones, as though life and art were deathbeds.

'Artistic retaliation would have been better, believe me,' the professor said confidentially. 'You should have beaten Fossé in the next examination.'

'I'll have a shot at that also, monsieur, if you don't mind.'

The professor went away smiling. Crowley put on his overcoat, and was going out to face

the music, when the life-class door opened, and a huge man entered the 'antique.' He wore only a short shirt, but carried in his arms the rest of his clothes. It was Prosper, a giant among artists' models.

Coming up to Crowley, the huge new-comer said, 'M'sieu, you need a partner in a row against a crowd. Very well. My wife was English. She—she is dead. I'm on your side, then, of course. See? *Mille bombes!*'

Prosper had lost one eye in a brawl, but the other was both keen and kind, though drink had sullied the whole face with deep crow's-feet and red blotches. The brown hair, a little grayed, was curly and well brushed; and the model never neglected his powerful body. After drink came dumb-bells and leg exercises.

'Thanks, Prosper. The fellows stand up for their own man,' said Crowley; 'but they won't do much. Not they.'

Prosper answered as an expert. 'M'sieu, a hooting crowd jostles, then it bashes in hats, and pretty soon it's a riot. *Don't I know?* A crowd has no sense. It's like a fever. *Mille bombes!* I've been a beast in a crowd, hitting men not half my size, and feeling like some one else. I stand by you!'

Then Prosper swore at his trousers because he had thrust his right foot into the left leg. Though excited, he dressed without another hitch, and looked a formidable figure in his long blue smock, a tall Flemish cap, and clattering sabots.

'I'll elbow the fellows all right,' he said, and strode off, twisting his long moustache and swaggering.

Crowley was amused till he passed into the quadrangle to be received with a hullabaloo of jeers, and cries of '*Vivent les Boërs!*'

Prosper walked ponderously into the double, agitated line, spreading out his arms. Not a word was spoken by the two allies, but Prosper's actions told the crowd that he had chosen his partner. A man six feet four in height and immensely muscular has an influence that people in a crowd don't wish to feel. The boys moved away, and soon they were nearly silent.

Prosper looked over his shoulder, saying, '*Mille bombes!* I'm like a mounted gendarme clearing a race-course.'

When they reached the Rue du Midi, Crowley shook the model's hand. 'We're going to be friends after this,' he said. 'Where do you live?'

'Rue du Paradis, No. 10, under the slates, m'sieu. Not a palace to be found in it—not one! *Mille bombes!*'

CHAPTER II.—PROSPER FINDS HIS DESTINY.

IN the room below Prosper's a little widow lived with her daughter, a very pretty child eight years old. Madame Caron was consumptive, but, with that light-hearted courage which often accompanies phthisis, she talked happily about the future, while earning her bread as a glove-maker. Now and then Prosper met her on the stairs, and was moved so much by the look of death in her face and figure that he always offered to carry her parcels or to do her shopping. She thanked him, but went on her way with smiling independence. Though she never snubbed the big man, she never stopped to talk, for Prosper's reputation in the house was that of a brawler who earned a few francs daily by showing his naked body to artists and students.

Prosper himself was proud of his work, as no other model could sit as he did for the giants in history and in fables. As for his thirst, he gratified it like Falstaff, untroubled by a prick of conscience. For these reasons he explained the widow's polite reserve by supposing that his manner was much too blundering. He remembered that when his wife lay dead he had put his big hand gently on her forehead—and felt monstrous. 'I'm too coarse,' he thought. But he eased his feelings by tying small bunches of flowers to Madame Caron's door-handle, or leaving two or three oranges on the door-mat; and once he placed there a large cabbage. After these exploits he took off his sabots and tiptoed upstairs, a great shyness at work in his immense body. When he reached the landing outside his own room, he screwed his face into hideous grimaces while stretching himself; and then, relieved, he muttered sometimes to himself, 'I could put her in my pocket, and she's going to die. *Mille bombes!* Why doesn't she let me fetch and carry for her?'

Prosper gave no thought to the pretty little girl, Mathilde, who for her age was very small and frail, and who, when her mother was at work, stayed with Madame Ricker, a neighbour downstairs. He was afraid of children. 'I don't know my strength,' he said, 'and if I nursed 'em I might crush 'em. I've dared to kiss two or three—yes, two or three, *mille bombes!*—and they howled with fear. I hurt 'em.'

At the beginning of 1900 Madame Caron was

caught in a storm, and her cough afterwards grew rapidly worse. Shortly after Paardeberg, at the beginning of March, the brief seasons of her perishable life drew near their end.

Prosper put milk and cream outside the door, and sometimes a franc wrapped in paper. The widow, wondering who sent these gifts, made inquiries, and a neighbour asked Prosper if he knew. 'Do I know?' he said. 'Have you no brain? The good old Abbé Antoine does these things. Who else? But—don't tell him that you know. No more gifts if you do. *Mille bombes!* He's as tricky as a thief when he's out to do good.'

One night early in April Prosper went to bed after drinking too much faro. How long he lay asleep in his clothes he had no idea; but all at once he was wide awake, listening to a cry in the room below. It was a child that cried, and the tone was full of fear. Some minutes passed, and, as the cry continued, Prosper rolled off the bed, lit a candle, and went downstairs. There was so much terror in the child's voice that he opened the door at once, and holding the candle at arm's length before him, peered into a dark room. At first he could see only the candle's rays, but soon a long, bare room became visible. In one corner was a bed, on which Mathilde was crouching. Between her screams she repeated the same words over and over again, and with her hand struck at something: 'Mother, mother! Speak!'

Prosper went rapidly to the bedside. Madame Caron was dead, and Mathilde, terrified by the cold body, was striking her mother's face.

Prosper was overcome. A tremendous pity gripped his heart. He felt so much that he could not think. With a trembling hand he put the candle on a small table, and bent over the child. He tried to speak, but his mouth was parched and something rasped in his throat. Even in this condition he remembered his great strength, and gathered Mathilde into his arms with a gentleness as touching as it was awkward. After a while the heart-rending cries stopped, and Mathilde, weeping less and less, clung to her new friend.

'Tell mother to speak,' she said all at once.

Prosper knew not what to say, and tried to ease his trouble by murmuring his habitual faith in a thousand bombshells. At last he said, 'They tell me, *fillette*, there's a better world than this—somewhere. In the better world no one talks, so it's pretty quiet there. Well, your mother's gone to the better world.'

'But mother's in bed,' Mathilde whispered. 'I see her.' She looked up into Prosper's face, and her tear-filled eyes were helpless and pleading.

The big man turned his head away. What answer was he to give? '*Mille bombes!*' he muttered. 'Why didn't I learn something when I tried to be at school?'

At this moment a footstep was heard on the stairs, and soon a short, stout woman entered

the room. She wore a jacket over her nightgown, and her eyes were moist with sleep. It was Madame Ricker. 'What are you doing here, Prosper?' she asked. Prosper looked at the bed, and Madame Ricker went to the bedside. 'I'm too late,' she said. 'Ah, I promised to be with her at the last, but I slept too long.' With the sheet she covered the dead face.

Prosper told his story, speaking in hushed undertones, and Madame Ricker listened with astonishment. Hitherto she had regarded him as a boor without heart.

'*Sapristi*, man! you've been quite good and reasonable,' she said; 'but now you'll give the little girl to me, of course.'

Prosper's blind eye twitched, a deep-red flush as of shame passed over his face, and in a voice unlike his own he declared that he and Mathilde were going to live together. 'I found her, and I keep her!' he stammered, becoming redder.

Madame Ricker stared at him, completely dumbfounded. If a tiger had asked for a cup of milk she might have looked as awe-struck.

'To be sure, I've four children of my own,' she said at last; 'but still, after all, you're a giant all thumbs. What can you do for Mathilde?'

Prosper made no answer. He left the room and went upstairs with the child in his arms clinging to his neck.

CHAPTER III.—ART AND LIFE.

ON a Monday morning, about a month later, Prosper sat for the painting school at the Academy, and was greatly honoured because the director himself selected the pose. Prosper was tired of Samson and bored by Hercules; he sighed for new and uncommon experience; and by good luck the director chose for him the character of a prehistoric warrior dressed partly in skins and carrying a mighty club. As soon as Prosper knew the meaning of the word prehistoric, his vanity swelled. 'M'sieu,' he said, 'in a part with plenty of blood in it, I think I feel quite well.'

Prosper being posed, the studio doors were thrown open, and one by one students entered. Each carried with difficulty a big canvas for a life-size study. The director gave them a familiar lecture on Prosper's muscles, and then told them, as usual, to be very serious. As he went towards his own studio, which adjoined the painting school, he stopped to speak to Crowley. 'Remember,' he said, 'that English students have plenty of sentiment—sometimes too much. What they need is command over their materials. Courage, then!'

No sooner had the director entered his studio than many students, taking advantage of the ease with which painters can talk and work simultaneously, began to chaff one another and to fire jokes at 'Vieux Mille Bombes.'

'The beauty-blotches on Prosper's cheeks are

going,' said one student. 'Has he a right to rob us of the celebrated notes of colour?'

'Has he been in jail for a few weeks?' another suggested. 'Jail means regular hours and no drink.'

'Leave Prosper alone!' cried Bertrand, a dark and joyous Frenchman. 'Why shouldn't he look as fresh as a rose? He gives me an idea for a Salon shocker. If I paint him as a medieval saint simmering in a cauldron of oil, what can stop me from making a sensation and a name?'

Then Colin, first man of the school, dapper and small and pale, put in his word. 'We live in a magic air of science,' he declared, waving his charcoal. 'So I give my great mind to causes and effects. Bertrand speaks of a possible effect of Prosper's reformation, while I, a true child of science, put my finger on the causes. Yesterday, while walking piously with my thoughts beyond Uccle, I came upon the origin of Prosper's idyllic transformation. Why does he look heavenly? Guess!'

Prosper flushed scarlet, and lost his pose. Every one noticed his agitation. 'Is he going to be married again?' a voice asked.

'Much worse,' Colin answered dolefully. 'Prosper has forgotten his old customs, and forsaken his convivial and congenial thirst, in order to become a father at second hand! A small girl, prettier than a Greuze, has been adopted, and she rules over him. Yesterday I spied upon them from behind some bushes, overhearing their talk. Yesterday I watched the tyrannous small girl. She pelted that big man with grass and flowers! And what did the big man do? Forgot his native character and collapsed into submissive gentleness! To-day, then, I'm unable to work. My scientific mind is upset by miracles.'

The effect of this burlesque story was great and instantaneous. Students surrounded the model's platform, bowing to him with mock reverence, and asking him to explain how he washed and dressed the child and put her to bed. Crowley stood aside and signalled his sympathy. But Prosper was hurt; below his kindness there was a feeling of shame; he wished the change in his life to be unknown; and now he was the butt of high spirits in a crowd of boys. Soon it was evident that Prosper would counter-attack. He put down the club, and his face became so dark with passion that Crowley intervened. Instantly the mood of the class moved from good-tempered ridicule to ill-humour.

'What have you to do with it, Englishman?' a shrill voice cried out.

'Yes,' said another voice, 'Crowley and Prosper are as thick as thieves. We must take 'em down a peg or two.'

'Must we be as Boers?' Colin asked.

While Colin spoke the model jumped from his platform and charged into his tormentors,

overthrowing several. Luckily the director heard the noise and entered in the nick of time.

'What's the meaning of this hubbub?' he asked. 'Silence!' In a few seconds every one was quiet. 'I need an explanation,' the director continued.

Prosper explained. In his anger all the truth came out, confused but sincere. When he spoke of Madame Caron lying dead in the dark, and the terrified little child striking the dead face while asking her mother to speak, every one was greatly touched. 'M'sieu,' the model ended, 'am I really to blame? Must I be mocked by everybody? Isn't the child helpless? *Mille bombes!* Why should I give her up?'

Shamefaced, the students returned to their easels.

'Well, Prosper, she will do you a great deal of good,' the director answered, nodding and smiling. 'The mocking is over; it won't be renewed. You have many friends now.'

CHAPTER IV.—IN THE RUE DU PARADIS.

IT was Crowley's custom to take a sprint before breakfast, when the boulevards were almost empty. At six o'clock next morning he began his run, and suddenly the idea of visiting Prosper came to him. In less than half-an-hour he reached the Rue du Paradis. Already Madame Ricker was at work, brushing dust over her doorstep.

'Is Prosper in, madame?' he asked.

'Yes. M'sieu Prosper lives on the top floor,' she answered, putting an emphasis of respect on the word 'M'sieu.'

'Madame, I see, likes the big man? So do I.'

'Now that he has found himself, he is worth liking,' the woman said. 'Before then I hated him, and kept my children around my skirts.'

Crowley smiled. 'He did many kind things before he found the small girl. Now that we know about these things we say that Prosper has found himself.'

'True. But if we praise him too much, m'sieu, he may ask me to lower his rent, and I've many mouths to fill. A mother of the poor must be prudent.'

Crowley went upstairs. On arriving at the second floor, he heard above him a very diligent snoring which seemed to rumble from the staircase itself. The sleeper's throat was more discordant than a German band at Ostend. There was a small landing on the top floor, and there Prosper lay asleep, fully dressed, with his head on a rolled-up sack. After a moment's hesitation Crowley touched him several times.

Prosper awoke slowly, yawning and stretching. 'Yes, yes, Mathilde. So it's time to work?' He sat up, showing in gruff yawns and sighs and by his movements that he was extremely stiff. '*Fillette*,' he went on, 'I'm fifty; I'm getting old. . . . *Mille bombes!* It's M'sieu Crowley!'

'Yes, Prosper; and, by the way, if you could

hear yourself snore you'd know something about *mille bombes*.'

There was a silence in which Prosper looked very shamefaced, and even guilty. 'Went to sleep drunk, I did,' he explained.

'Shall I ask Mathilde?'

In an instant Prosper was on his feet. 'Are you going to set her against me?' he asked with some anger.

'Rubbish, Prosper! We're friends. I want to know if you and the child can come with me into the country. There's a competition sketch to be done—"Springtime in an Orchard." Are you free?'

'To-morrow I shall be free, m'sieu.'

Next day the competition sketch was made, and Crowley heard many things. Mathilde had a cough, and her pretty flushed cheeks were wasted. The doctor feared that she would soon be consumptive if she lived in the lifeless air of a narrow street. Could Prosper take her to the country?

'You see, m'sieu, it's easy to move if one has money, but my few savings went in drink. Still, the Abbé Antoine is going to help me. He knows several priests in my part of the world—the Ardennes.'

'What do you wish to do?' Crowley asked.

'Rent some patches of land and grow vegetables and keep fowls and a pig—somewhere in the valley of the river Semois. Many trees are felled in that district, and I shall get good odd jobs.'

Prosper smiled, but there was no amusement in his face. His eyes followed Mathilde, who was picking field-flowers, with sunlight gleaming on her pale and curly gold hair. 'Isn't she born for the country?' he asked. 'All youngsters are, it seems to me. Keeping 'em in streets! *Mille bombes!* As well keep grasshoppers in a thimble!'

They watched the child at play. Presently Crowley said, 'Does she talk much? She plays incessantly, but how many words has she spoken? Perhaps a dozen. Shyness?'

'Too natural to be shy, m'sieu. It's with her eyes that she talks and questions—more than too much for me. When I tell her that bread-and-milk is better for her than bread-and-treacle, her big blue eyes ask why. Well, m'sieu, what's a man to say?'

Prosper blew out his cheeks, rubbed his forehead, and rumbled his hair. 'Doctor says she puts her little bit of strength into play, and will chatter fast enough with her tongue when her health's better. But I don't know. M'sieu, I've seen a small boy who took to music as natural-like as he did to food, not knowin' why, except that he wanted it. Well, Mathilde asks questions with her eyes not knowin' why, and listens while I and others trip ourselves up in words. Listens and remembers, mind. It makes me afraid and shamed, m'sieu; for what

do I know about anything? If I could put her in my cap and wear her on my head I might get a bit of sense, though I'm not sharp. I try to read—in a way—but'—

Prosper pulled a wry face over his attempt at reading. Crowley smiled at the simple, eager, kindly giant.

'You'll go to the Ardennes all right, Prosper. Leave it to me. I'll raise a subscription, with the director heading the list. You'll see! It's a famous place for sketching, the Ardennes—good all the year through. Will you try to keep a spare room in your cottage? If you do, you'll see me now and then for a week.'

'Isn't this a plot, m'sieu?' asked Prosper, his face glowing with pleasure.

'It's a plan—one easy to handle.'

And Crowley was right. In a few weeks two thousand francs had been subscribed; and Abbé Antoine, with help from a friend, rented four acres of good land in the Semois valley. A small cottage roofed with pantiles, a fowl-house, and a pigsty became Prosper's; and a neighbouring cottar's wife would keep an eye on Mathilde, and be useful in other ways. Two miles off in a village was a little school.

At the beginning of July, in time for the harvest season, Prosper and Mathilde took train from Brussels. Twenty or thirty students gave them a hearty send-off, Crowley calling for three cheers, and the Belgian students doing their best.

A SUMMER CAMP ON A HEBRIDEAN ISLAND.

By SETON GORDON, F.Z.S.

LYING to the westward of the island of Mull there stands a group of small grassy islands. Now quite deserted and uninhabited, they harbour, summer and winter, a great variety of bird-life. From October to April numbers of barnacle-geese frequent their slopes, feeding on the grass, which here is green almost the whole year round; and with the departure of the geese for their breeding-haunts on the steep cliff-faces of Spitzbergen, many fresh birds reach the islands, coming in from the vast spaces of the ocean in order to rear their young, unmolested and undisturbed.

It was early in July that a companion and I sailed out from the mainland of Mull and pitched our tent on the largest of the islands, perhaps a mile and a half in length and half a mile across at its broadest point. After a long spell of rough, unsettled weather, not the faintest of breezes ruffled the surface of the Atlantic, and every island was distinct. Having landed on the island, we set about choosing a good camping-ground, and at length decided on a grassy strip at the extreme northern end of the island. The choice of a camping-site was somewhat limited, as a number of bullocks grazed on the island, and a spot had to be chosen which these destructive animals could not approach. Our equipment consisted of two small alpine tents, one to sleep in, the other to store our provisions and to use for our meals during bad weather. Our mainstay in the food line was oatmeal, which was supplemented by such accessories as eggs, bacon, and a supply of kippers. On opening the package containing the last mentioned we experienced somewhat of a blow, for there were only half the number which we had expected to find, and which we had paid for.

Fortunately for us, a spell of magnificent weather set in, commencing with the day of

our arrival, and our time was fully occupied in studying and photographing the many sea-birds with which the island was peopled.

From our tent an unsurpassed view extended in every direction. In the evenings, after we had turned in, we saw the red afterglow in the northern sky, showing up the great hills of the island of Rum, black as night against the luminous clouds. Bearing slightly more to the east, there rose from the twilight the serrated peaks of the Coolin Hills on the isle of Skye. Throughout the night, or, rather, hours of twilight—for in latitude fifty-six degrees north there is no darkness during the season of summer—the dull red glow never left the northern horizon, but gradually travelled from north-west to north-east. It was at this point that the sun first showed itself, casting its reflection on the quiet waters ere, gathering strength, it rose high in the heavens to shed its warm rays on land and sea. Many hills were visible from our island, but none was so conspicuous or magnificent in its varying moods as Ben More, in the island of Mull. Rising straight from the Atlantic waters, Ben More attracted to itself many clouds, so that even when the sun shone warmly and all other hills were clear, a filmy white cloud, conforming in shape to the conical peak of the mountain, shrouded the summit of the Ben. Then away to the west there lay on the horizon the fertile island of Tiree, so plain-like that its houses stood revealed against the horizon. North of Tiree stretched rugged and heather-clad Coll, and away behind it again were the peaks of the distant Outer Hebrides—of Barra and South Uist, faintly outlined against the sky.

From the centre of our island there rose a small hill perhaps 400 feet above sea-level. From this hill, after sunset, one by one the distant

lighthouses could be seen throwing their beams far across the ocean. On the south-west horizon the flashes from Dubh Hirteach and, a little to the west, Skerryvore stabbed the gathering twilight. Then, turning east, one saw the steady glow of the lighthouse on Ardnamurchan, the most westerly promontory of the Scottish mainland; while to the northward were the flashes of Heiskeir Light.

Few—very few—steamers passed by, though from time to time a herring-drifter, working from Mallaig perhaps, or from Oban, passed our island at sunset, making for the fishing-grounds. On clear days we could make out through the glass small sailing-boats working at the lobster-fishing round the island of Mull, and when the wind was contrary these boats, on one of their tacks, approached almost to within hailing-distance.

Amongst the great bird population of the island the puffins in number were easily supreme. These quaint birds were to be numbered literally in their thousands, and were active at all hours of the day and the night. A number of puffins were nesting close to our tent, which at first they viewed with intense suspicion. One or two individuals, which had their young concealed among the rocks perhaps thirty yards from our camp, used to arrive from their fishing-grounds in the early hours of the morning, their bills packed with numbers of small fry.

Time after time these birds would fly round, making as though to enter their holes, but at the last moment would be seized with panic, and would hurriedly resume their flight, circling well out to sea and going through the same performance about half-a-minute later. Ultimately one of the puffins seemed to think that there was a limit to this sort of thing, and summoning up all its courage, alighted at the entrance to the nesting-hole among the boulders, and, after a second's quaint survey of the scene, scrambled in undignified and ludicrous haste to the safety of the rocks. At certain times hundreds of these birds would disport themselves in the sea just off our camping-ground, and when they were disturbed the noise of many feet and wings splashing through the water was quite surprisingly loud. There was one rock where puffins used to congregate at all hours of the day and apparently hold consultations of considerable importance. When they were thus engaged one could approach, by careful stalking, to within a very few feet of the birds. I remember on one occasion a puffin actually going to sleep with head tucked away among its feathers while I was kneeling with my camera in position not more than three feet distant.

The most favoured nesting-sites of the puffins were holes which they excavated in the soft peaty earth, though sometimes they appropriated rabbit-burrows, evicting the rightful owners. On one occasion a rabbit which we had dis-

turbed sought safety in a burrow where a mother-puffin was brooding her solitary chick. By peering into the mouth of the burrow we could see the puffin pecking angrily at the rabbit with her powerful parrot-like bill, until the animal, thoroughly scared, had to bolt to fresh and safer quarters. Few enemies had the puffin, but one there was that made a habit of waiting over the sea near the island for these birds as they winged their way rapidly homewards with a supply of sand-eels for their young. Swift of wing was this enemy, the Arctic skua, so that the puffin singled out for pursuit was rapidly overtaken, and to save his hard-earned catch was obliged to hurl himself to the sea, where he disappeared beneath the waves. The skua, nonplussed, and unable to follow, had perforce to search for another victim, when the same tactics were repeated. I do not think that the skuas can have found the game of puffin-chasing very profitable!

In the vicinity of our camp two pairs of oyster-catchers had their broods, and never became used to our presence, whistling shrilly and repeatedly in great alarm when either of us emerged from our tent. A striking contrast to their noisy fussiness was the behaviour of a ringed plover who brooded her four eggs quite contentedly on the shingle near, and ultimately hatched off her brood on the day on which we left the island. As showing the vitality of an unborn chick, I may mention the case of a pair of rock-pipits who had their nest only ten yards or so from our camp. For some days we had noticed the birds fluttering round and calling anxiously, but were at a loss to know where their nest could be situated, till one day the behaviour of one of the birds afforded a clue, and the nest was quickly discovered. It contained five eggs, absolutely cold to the touch, and we felt convinced that they could never hatch out, more especially as the parent bird appeared unable to summon up sufficient courage to brood on them when we were in or near to the tent. What, then, was our astonishment to find, two days later, a clutch of healthy chicks in the nest!

Our camping-site was an ideal one—save for one little thing. Less than a hundred yards away was a narrow channel among the rocks where previous storms had washed up a mass of seaweed of the *Laminaria* order. This weed was now in process of decay, so that when the wind blew from the semi-liquid mass across to our tent the aroma, though quite harmless and even healthy, could not, by the greatest stretch of imagination, be called a pleasant one. Fortunately for us, the wind never held in the unwelcome direction for long, though while it lasted conditions were decidedly uncomfortable.

Almost joined on to our island—at low spring-tides one could wade the channel—was a

long rock, with a grassy summit on which sheep grazed. Here of an evening seals resorted, and for hours on end their barking cry was carried across the channel. Their call was extraordinarily like the bark of a dog, so much so that on one occasion we were almost tempted to believe that a dog had indeed in some manner become stranded on the rock, and was barking for help in a mournful key.

At various points of the island were colonies of gulls. In one place a colony of lesser black-backs nested in harmony with herring gulls; while at the extreme end of the island, on a grassy plateau, there nested in solitary state a few pairs of that magnificent flier, the greater black-back. These birds loved soaring, in the teeth of a stiff breeze, above the highest point of the island, where, at a height of 390 feet above sea-level, I found a down-clad youngster of the species. The stirks apparently did a good deal of damage to all the gulls' nests by trampling upon them, for in deserted nests we found many half-crushed eggs, and we noticed that the gulls appeared uneasy when the cattle moved their way. No ravens inhabited the island, but where the cliff dipped sheer into the sea a pair of buzzards had their nest, containing two well-feathered young, the parent birds when disturbed sailing out to sea, with, perhaps, an irate greater black-back in hot pursuit. On ledges of the cliffs, white with much guano, hundreds of guillemots tended their brightly and diversely coloured eggs or solitary chicks; while from the more sheltered crannies razorbills peered forth inquiringly with intelligent expression. A pair of gray crows spent their time in purloining the eggs of the kittiwakes, which nested in the rocks in large numbers. These eggs they carried to a well, where they sucked them carefully,

washed down with draughts of spring water. At this well I counted over ninety eggs of various sea-birds, mostly kittiwakes, and all had probably been carried there by one pair of hoodies.

After more than a week of ideal weather, a falling glass, with wind from the south-west, gave warning of a change, and now followed a succession of unpleasant days, with misty rain, and a heavy swell on the sea. The day on which we had intended leaving the island came round, and a gale from the north-west set up a rough and confused sea, so that the small fishing-boat which was due to relieve us was unable to leave her harbour. This was on a Saturday, and it was not until the afternoon of the Tuesday following that, in response to a fire of dried seaweed lighted as a distress-signal, we saw the extremely welcome small white sail making for the island. By this time our stock of provisions was alarmingly low, and we had decided, failing relief, to sample the following day some of the young birds on the island, although reluctant to do this excepting as a last resource.

The relief boat had approached slowly to a position about half a mile from our island, when a thick white fog descended over the sea, and, although straining our eyes to their utmost, we gradually lost sight of the boat, picking her up again when she was only fifty yards or so from the landing-place. It was fortunate that this thick fog held off as long as it did, for the passage abounded in rocks, and I doubt whether under these conditions the fishermen would have risked the crossing, though as it was we soon got beyond the fog-bank, and regained the harbour on the mainland after a calm and uneventful passage.

THE PARTS MEN PLAY.

By ARTHUR BEVERLEY BAXTER, Author of *The Blower of Bubbles*, *Merrie Gentlemen*, &c.

CHAPTER XVI.—THE FEMININE TOUCH.

I.

IN a small South Kensington flat a young woman was seated before a mirror, adding to her beauty with those artifices which are supposed to lure the male to helpless capitulation. Two candles gave a shadowy, mysterious charm to the reflection—a quality somewhat lacking in the original—and it was impossible for its owner to look on the picture of pensive eyelashes, radiant eyes, and warm cheeks without a murmur of admiration. She smiled once to estimate the exact amount of teeth that should be shown; she leaned forward and looked yearningly, soulfully, into the brown eyes in the glass. . . . With a sigh of satisfaction she lit a cigarette from one of the candles, and leaning back,

watched the smoke passing across the face of the reflection.

'Hello, Elise!' said the beauty casually, as the door opened and Elise Durwent entered, dressed in the uniform of an ambulance-driver. 'You'll find the room standing on its head, but chuck those things anywhere.'

'Going out again?' asked the new-comer, stepping over several feminine garments that had been thrown on the floor.

'Just a dance up the street—in Jimmy Goodall's studio. Listen, old thing; do put on some water. I'm croaking for a cup of tea.'

Without any comment, Elise went into the adjoining room, used as a kitchen, while the voluptuary dabbed clouds of powder over her neck and shoulders. With a tired listlessness,

Elise returned and sank into a chair, from the back of which an underskirt was hanging disconsolately.

'You didn't do the breakfast-dishes, Marian.'

'Didn't I? Oh, well, they're not very dirty. Had a rotten day at the garage?'

'It was rather long.'

'You're a chump for doing it. Working for your country's all very well, but wait until after the war and see if the girl who's spoiled her hands has a chance with the men. Why don't you wangle leave like I do? You can pull old Huggin's leg any day in the week—and he likes it. All you have to do is to lean on his shoulder and say you won't give up—you simply *won't*. Aren't men a scream?'

'I suppose so,' said Elise after a pause.

'Who is your cavalier to-night?'

'Horry.'

'Horace Maynard?'

'Absolutely. You know him, don't you, Elise?'

'Yes. He was visiting at our place in the country when war broke out. When is he going back to France?'

'Monday.'

'He's been dancing pretty constant attendance, hasn't he?'

'*Ra-ther*. He says if I don't write him every day after he buzzes back, he'll stick his head over the parapet and spoil a Hun bullet.'

'Those things come easily to Horace.'

'Oh, do they? I notice he doesn't go to you to say them.'

'No,' said Elise with a smile, 'that is so. Think of the thrills I miss.'

'Now don't get sarcastic. If Horry wants to make a fuss over me, that's his business.'

'What about your husband at the front?'

'My husband and I understand each other perfectly,' said the girl, glancing critically at the picture of two parted, carmined lips in the mirror. 'He wouldn't want me to be lonely. He knows I have my boy friends, and he's not such a fool as to be jealous. You want to wake up, Elise—things have changed. Any woman who sticks at home and meets her darling hubby at night with half-a-dozen squalling kids and a pair of carpet slippers—no thanks! The war has shown that women are going to have just as much liberty as the men. We've taken it; and I tell you the men like us all the better for it.'

'You think that because every man you meet kisses you.'

'Elise!'

'Good heavens! Don't they?'

'Well, I never! Anyhow, what if they do? Is there any harm in it?'

Elise smiled and shook her head. 'None, my dear Marian,' she said. 'There is no possible harm in it. There's no harm in anything now. The old idea that a woman's purity and

modesty—— But what's the use of saying that to you? Of course you're right. Who wants to stay at home with a lot of little brats, if you can have a dozen men a week standing you dinners, and mauling you like a bargee, and'——

'Elise!'

'There's the water getting near the boil.' Elise rose with a strange little laugh and looked at a yellow silk stocking which dangled over the side of a wicker table. As if trying to solve a conundrum, she glanced from it to the shapely form of the young woman at her toilette. 'When the war's over,' she said ruminatingly, 'and our men find what kind of girls they married when they were on leave'——

'There you go again. For Heaven's sake, Elise, if you can't attract men yourself, don't nag a girl who does. You're positively sexless. The way you talk'——

'There's the water. When Horace comes I don't want to see him.'

'I guess he can live without it,' said the patriotic, leave-wangling war-worker with an angry glance at Elise as she disappeared into the kitchen. Catching a glimpse of the frown in the mirror, she checked it, and once more leaned towards the reflection as if she would kiss the alluring lips that beckoned coaxingly in the glass.

II.

Marian had gone, radiant, and exulting in her radiance; and Elise sat by the meagre fire trying to take interest in a novel. Although she had found it easy to be confident and self-assertive when the other girl was there, the solitariness of the flat and the silence of the street undermined her courage. The dragging minutes, the meaningless pages. . . . She wished that even Marian were there in all her complacent vulgarity.

Although she had drawn many people to her, the passing of the years had left Elise practically friendless. It was easy for her to attract with her gift of intense personality; but the very quality that attracted was the one that eventually repelled. The impossibility of forgetting herself, of losing herself in the intimacies of friendship, made her own personality a thing which was stifling her life. Since she was a child she had craved for understanding and sympathy, but nature and her upbringing had made it impossible for her to accept them when they were offered. Lacking the power of self-expression, and consequently self-forgetfulness, her own individuality oppressed her. It was like an iron mask which she could not remove, and which no one could penetrate.

Going to London soon after the outbreak of war, she had been taken on the strength of a motor-ambulance garage; and to be near her work she had leased a small flat in Park Walk, sharing it by turn with various companion drivers. Although her desire to be of service

was the prime reason of her action, it was with unconcealed joy that she had thrown off the restraints of home. Freedom of action, a respite from the petty gossip of her parents' set, had loomed up as the portals to a new life. The thought of sharing the discomforts and the privileges of patriotic work with young women who had broken the shackles of convention was a prospect that thrilled her.

To her amazement, she discovered that the feminine nature alters little with environment. It was true, her new companions had broken with all the previous conceptions of decorum, but they had used their newly found liberty to enslave themselves still further with the idea of man-conquest. Officers—callow, heroic, squint-eyed, supercilious, superb, of any and every allied country—officers were the quarry and they the hunters. To love or not to love? Their talks, their thoughts, their lives concerned little else. They fought for the attentions of men like starving sparrows for crumbs.

In such an environment, where she had hoped to lose the burden of persistent self, Elise found emancipation farther away than ever. The *abandon* of the others first created a reversion to prudery in her breast, and then developed a cynical indifference. The others treated her with friendly insouciance. Had she been ill, or had she met with an accident, there was probably not one who wouldn't have proved herself a 'ministering angel.' As it was, they largely ignored her, indulging the instinct of inhumanity which so often is woman's attitude towards woman.

So she sat alone, the Elise who had always been so resolute and independent, feeling very small and pathetic, yearning for far-off things—utterly lonesome, and a little inclined to cry.

The words of the book grew dim, and her thoughts drifted towards Austin Selwyn. He had been contemptible! A pacifist! His idealism was a pose to try to ennoble utter cowardice. At a time when men's blood ran high he had prated of brotherhood—and peace—and suggested that the infamous Hun had a soul! How she hated him! . . . And when she had finished with that thought her heart's yearning returned more cruelly than before.

That evening by the trout-stream when she had seen Dick hiding in the bush, Selwyn had caught her when she had almost swooned. He had gripped her arms with his hands, and, quivering with emotion, had lent his strength to her. At the memory the crimson of her cheeks deepened. They had been so close to each other. His burning eyes, his lips trembling with passion—what strange impulse in her heart had made her thrill with a heavenly exhilaration? For that instant while his hands had gripped her a glorious vista had appeared before her eyes—a world of dreams where the tyranny of self could not enter. For that one instant her

whole soul had leaped in response to his strong tenderness.

She tried to dismiss the recollection as an admission of cowardice engendered of the night's mood. But she could not do away with the memories which lingered obstinately. Not since the days when Dick had offered his blind loyalty had any one tried to understand her as Austin Selwyn had done. She was grateful for that. She might even have valued his friendship if he had not been so despicable that awful night. To insult her with his talk of pacifism, and then, heedless of her intensity, to propose to her! She could not forgive him for that. She was glad her words had stung him!

Minutes passed. The fire would not answer to any attention, but sulkily lived out its little hour. The evening seemed interminable.

It was shortly after ten o'clock when there was a knock at the door, and Elise hurried to open it, thinking there might be a message from the garage.

'It's only me, Elise,' said a familiar voice.

'Oh!—Horace,' she laughed. 'What's the trouble? Did Marian leave anything behind?'

'No. I was just absolutely fed up; and when she told me you were here alone, I thought I'd jolly well come down and talk to you.'

'Good! Come in. You mustn't stay long, though. Please don't notice this horrible mess.'

In sheer pleasure at the breaking of the solitude, her vivacity made her eyes sparkle with life. Her sentences were crisp and rapid, and as she led the young officer to a seat by the fire it would have been difficult for Elise herself to think that a few minutes before she had been helplessly and lonesomely on the brink of tears.

'How is the dance going on up the street?' she asked, as Maynard inserted a cigarette between his lips without lighting it.

'It's a poisonous affair.'

'Poor boy!'

'I'm fed up, Elise. I'm—I'm *gorged*. When I heard you were down here, I said, "By George! I'll go and see her. I can talk to Elise. She's got some sense."'

'What a thing to say about a woman!'

'Don't chaff me, Elise. I can't stand it. I'm frightfully upset—really.'

'What has Marian been doing to you?'

'Nothing, except making a blithering ass of me. You know, I was fearfully keen on her, and I've passed up all sorts of fluff so as to do the decent; but when that brute Heckles-Jennings advised me to-night to be sure and sit out a dance with Marian because she was such hot stuff, he said . . . Of course, he's an outsider and all that, and I told him to go to hell—but you don't blame me for feeling cut up, do you, Elise?'

'Didn't you know she was that kind?'

'What kind?'

'Oh—the—the universal kisser—the complete osculator—the'——

'I say'——

'But surely you don't think you are the only one she has made a fool of? To begin with, there's her husband in France—a brother-officer, Horace.'

Maynard wriggled uneasily, sliding down the chair in the movement until his knees were very near his chin.

'He's a rotter, Elise.'

'Do you know him?'

'N—no. But Marian says he absolutely neglects her. He's one of those cold-blooded fish—doesn't understand her a bit. After all'—the extra vehemence shifted him another few inches, so that he presented an extraordinary figure, like the hump of a dromedary—'women must have sympathy. They need it. They'——

'Oh, Horace!' Elise burst into a laugh. 'Are there really some of you left? How refreshing! Why don't you put it on your card: "2nd Lt. Horace Maynard, Grenadier Guards, soul-mate by appointment."'

'I wish you wouldn't laugh like that.'

He was a picture of such utter dejection that, checking her mirth, Elise laid her hand on his arm. 'Sorry, Horace. You know, if it hadn't been for this war we might never have known how nice our men are. I only wonder how it is that the women have the heart to make such fools of you.'

The unhappy warrior pulled himself up to a fairly upright posture and tapped his cigarette against the palm of his hand. 'I'm glad,' he said with a slight blush, 'that you don't quite put me down as a rotter. I don't know what's come over us all. Before the war, when you met a chap's wife—well, hang it all!—she was his wife, and that was all there was about it. But nowadays'——

'I know, Horace, it's a miserable business altogether—partly war hysteria, and partly the fact that women can't stand independence, I suppose. Marian's a splendid type of the female war-shirker. You know she's married; yet, because she lets you maul her'——

'I say, Elise!'

'——and she murmurs pathetically that her husband in France neglects her—at least, that's what she tells you. When she was dressing to-night Marian said that she and her husband absolutely trusted each other.'

'By Jove! You don't mean that?'

'She also said that all men, including you, were a scream. Probably she considers you a perfect shriek.'

Trembling with indignation, Maynard suddenly collapsed like a punctured balloon and relapsed dejectedly into his recumbent attitude. 'What an ass I have been!' he lamented sorrowfully. 'What a sublime ass! And Marian—the little devil!'

'Rubbish!'

'Eh? I suppose you think I am an idiot for—— Well, perhaps you're right.'

For a couple of minutes nothing was said, and the melancholy lover, with his chin resting on his chest, ruminated over his unhappy affair.

'Hang it all!' he said at last, hesitatingly, 'when a chap gets leave from the front he's—he's sort of woman-hungry. You don't know what it feels like, after getting away from all that mud and corruption, to hear a girl's voice—one of our own. It goes to the head like bubbly. It's a—a dream come true. There's just the two things in your life—eight or nine months in the trenches; then a fortnight with the company of women again. It's awfully soppy to talk like this'——

'No, it isn't, Horace. It's the biggest compliment ever paid our women. I only wish we could try to be what you boys picture us. That's what makes me feel like drowning Marian every few days. Horace, I'm proud of you.'

She patted his hand which was grasping the arm of the chair, and he blushed a hearty red.

'Elise!' He sat bolt-upright. 'By gad! I never knew it until this minute. You are the woman I ought to marry. You are far too good and clever and all that; but, by Jove! I could do something in the world if I had you to work for. Don't stop me, Elise. I am serious. I should have known all along'——

'Horace, Horace!' Hardly knowing whether to laugh or to cry, Elise put her hand over his mouth and checked the amorous torrent. 'You're a perfect dear,' she said, 'and I'm ever so grateful'——

'But'——

'But you mustn't be silly. This is only the reaction from Marian.'

'It's nothing of the sort,' he blurted, putting aside her hand. 'I—I really do—I love you. You're different from any other girl I ever met.'

'My dear, you mustn't say such things. You know you don't love me as you will the right girl when you meet her.'

He got out of the chair by getting over its arm. 'I beg your pardon, Elise,' he said, not without a certain shy dignity. 'I meant every word I said—but I suppose there's some one else.'

'Only a dream-man, Horace.'

'What about that American?'

'What—American?' Her agitation was something she could hardly have explained.

'That author-fellow at Roselawn. He was frightfully keen on you. I remember half-a-dozen times when he would be talking to us, and if you would come in he'd go as mum as an oyster, and just follow you with his eyes. Is he the chap, Elise?'

'Good gracious!'—she forced a laugh—'why, I don't even know where he is.'

'Don't you? He's in London; I can tell you that much. Last month in France I ran across that Doosenberry-Jewdrop fellow—you know—the futurist artist.'

'Do you mean Johnston Smyth?'

'That's the chap.'

'I didn't know he was in France.'

'Rather. I thought your brother would have told you.'

'My brother?' There was not a vestige of colour in her cheeks. 'What do you mean?'

Maynard scratched the back of his head. 'Smyth told me,' he said, wondering at the cause of her agitation, 'that Dick and he enlisted together some months ago. By Jove! I remember now. He told me that this American fellow put them up at his rooms in St James's Square one night. Smyth didn't know who Dick was until they got to France. He was travelling under the name of Sherlock, or Shylock, or Sherwood'—

'I—I thought Dick was in China.' She wrung her hands nervously. 'You didn't see him?'

'No. That's all I know about him, except that he was transferred to some other battalion than Dingleberry Smyth's.'

She went over to a table and took a piece of notepaper from a drawer. 'Mr Selwyn used to belong to the R.A.C.,' she said quickly. 'Would you do me a favour, Horace dear?'

He murmured his desire to be of service in any capacity. Hesitating a moment, she wrote hurriedly:

'4th March 1916,
'21A PARK WALK.

'DEAR MR SELWYN,—Will you please come and see me as soon as you can? I am not on night-duty this week.—Yours sincerely,

'ELISE DURWENT.'

She sealed the envelope and handed it to Maynard. 'Please find out from the R.A.C. where he is, and ask them to send this note to him. I am ever so grateful, Horace.'

'I suppose,' he said, looking at the envelope, 'that this means the—the finish of my chances?'

She ended the question by wishing him good luck in France, but there was a strange tremulousness in the softly spoken words.

He put out his hand shyly. 'Good-night, old girl,' he said, smiling with a sort of rueful boyishness.

She took his proffered hand, and then, obeying an impulse, stooped and pressed her burning cheek against it. 'Good-night, Horace,' she said softly. 'I hope you'll come back safe to be a fine husband for some nice girl.'

When he had gone, and his footsteps died away, she returned to the table. Burying her face in her hands, she fought back the tears which surged to the surface. Her love for Dick, her own loneliness, a mad joy in the thought of seeing Selwyn again, a motherly pity for Maynard, a fury towards Marian, an incomprehensible yearning—she felt that her heart was bursting, but could not have said herself whether it was with grief or with joy.

(Continued on page 361.)

MIXING FOODS.

By P. R. GORDON.

IT is considered by many people that a mixed diet is necessary for the proper functioning of the digestive organs, and that digestion is thus more rapidly accomplished, and the food more completely assimilated, than when only one kind of food is taken. While it is true that we require, for the maintenance of health and the proper nourishment of the body, the salts and the acids found in fruits and vegetables, the fats in cream and butter, and the carbohydrates in starchy foods, we do not need them in a heterogeneous mass.

One of the chief causes of digestive disturbances is the mixing of foods which do not harmonise. There are several reasons for this. The process of digestion is a complicated one, and foods vary greatly in the time required for their digestion—a fact some people do not realise. A ripe apple, for instance, is digested in a healthy stomach in one hour, while a cabbage takes from four to five hours. Should both these articles be taken into the stomach at the same time, both must remain there until they are digested, as they will become so intermingled in the process of digestion that

they cannot possibly be separated. The apple, digested and ready for absorption, if not absorbed, ferments, and flatulence and other disagreeable symptoms of ordinary indigestion result.

Some foods are digested in the stomach, others in the small intestine; it is quite conceivable that they should not be eaten together. Starchy food requires an alkaline saliva to prepare it for digestion; if acid fruit is eaten at the same time there is certain to be delay in this process.

Raw food and cooked food should not be eaten together. In the former the organic salts are unchanged; in the latter these salts undergo a distinct change in the process of cooking. One pound of raw food contains as much nourishment as two pounds of cooked food, but the average person's stomach is, as a rule, quite unaccustomed to food in a raw state, and this fact is not generally observed when such food is eaten in addition to the cooked food which makes up the daily dietary. Digestive disturbance results in most cases, although in a healthy stomach the disagreeable feelings are more or less evanescent.

Milk is a food which is used very indiscriminately. It is mixed with all kinds of foods, and is looked upon by many people as a drink instead of a food. It is often stated that milk is a perfect food. So it is—for the young of the animal that provides it.

Milk is almost entirely deficient in iron, and is therefore not sufficient nourishment for a fully developed human body.

An important reason why milk is such a valuable food for growing children is on account of the high percentage of lime salts it contains. There is no food in the entire mineral, vegetable, or animal kingdom so rich in lime salts as milk. All kinds of meat are almost useless when it is a question of lime salts. Goat's milk is not so rich in lime salts as cow's milk, and egg-yolk does not contain more than about one-fourth of the quantity contained in cow's milk, warm from the cow.

Persons of an atrophic or an anæmic temperament, or a mental-osseous temperament—tall, slender, bony, muscular persons with a high degree of intelligence—need lime salts and iron salts in abundance. Iron salts are contained in raspberries, blackberries, strawberries, dark cherries, spinach, black-currants, egg-yolk, and certain vegetables.

The diet of the average person, consisting of white bread, bacon, tea or coffee, sugar, meat, potatoes, &c., contains but a very small quantity of lime salts. In fact, the average intake of lime is only about one-third the amount actually required by the body. Lime, like iron, taken in a mineral form is not readily assimilated by the stomach. Many people find that milk disagrees with them, and therefore seldom take it. The reason for this lies, no doubt, in the casein product that milk contains. If a little lemon-juice be added to milk—especially warm milk—before it is taken, it will be found then that it does not cause digestive disturbance.

Milk and fruit, meat and milk, milk and raw vegetables do not combine well. Milk is best taken alone or in milk-puddings, with oatmeal porridge, and in that form known in America as 'graveyard stew'—milk-toast. 'Milk-shake,' composed of milk, soda-water, and a small quantity of ice-cream, is a very popular 'soft' drink in that country. Another excellent food-drink is made from two glasses of milk, with from two to three raw egg-yolks and a teaspoonful of sweet-clover honey added, the whole being well shaken for about two minutes.

In order to test the effect of a strictly milk diet on the adult human body, the writer carried out an interesting experiment a few years ago. An eight days' fast was first completed. During this time nothing but pure cold water was taken—three to four quarts daily. Ten pounds in weight was lost during the period of the fast. On the morning of the ninth day the fast was broken on a table-spoonful of tomato-juice, which

entirely upset the stomach; twelve hours later a table-spoonful of unfermented grape-juice was tried, with no bad effect. Next day was a grape-juice day, a wine-glassful being sipped through a straw at hourly intervals. On the following day the milk diet was commenced. Half-a-pint was taken, in the same manner, every hour for eight hours; this was increased next day until, on the fourth day of the diet, a maximum of six quarts was reached. This quantity was consumed daily up to the twelfth day, when a nauseating milk-sickness supervened, and the diet was stopped. The gain in weight during the period was twenty-five pounds, but five pounds of this was lost when a solid-food diet was resumed—on the thirteenth day. The experiment was satisfactory in every way. The increase of physical and mental vigour surpassed all expectation; in short, a complete rejuvenation took place.

It is necessary to state that an experiment of this nature should not be undertaken unless certain conditions are fulfilled. The mind must be entirely free of worry, and of fear regarding the outcome of the fast; otherwise more harm than good will result. Further, one must be prepared to ignore the solicitous attentions and inquiries of anxious relatives and friends who see the experimenter daily growing less and becoming beautifully thin! Suitable environment is essential, and under no circumstances should the experiment be tried in winter or early spring; the best time is during the summer months, when one can secure the beneficial action of the sun's rays on the naked body. Baths—internal and external—must be taken daily, but on no account should much physical exercise be attempted.

There is a tendency to overeat on a mixed diet. After one has eaten to repletion of an ordinary meal of soup, bread, meat, and vegetables, to be served with a tasty swiss tart or trifle is a great temptation—one which most people do not try to resist. A cup of coffee usually follows, and then the diner feels disposed to sleep off the effects of this hearty meal. Yet some people, who eat heavy mixed meals day after day, wonder why they are troubled with the disagreeable physical feelings that follow closely those who live to eat.

The American people are probably the worst offenders in this respect. With their jumbled-up meals of fruit and cereals with cream, waffles, and maple syrup; hamburger steaks and German pot roasts; clam chowder and oyster stews; 'angel' and other highly iced cakes; ice-cream and coffee; iced water at every meal; and, last but not least, the numerous varieties of pies, is it surprising to find that America has been called a 'nation of dyspeptics'? The country is overrun with food scientists; chiropractic and osteopathic doctors; raw-food faddists and sour-milk cranks; natural healers whose methods,

to say the least, are peculiar; and mausoleum companies flourishing exceedingly!

On the other hand, there are countries where the national diet is of the plainest kind. A notable example of this is Scotland, where a splendid type of manhood is reared on a simple diet, the basis of which is oatmeal porridge and milk.

'The plainer the living the higher the physical

standard' is just as true a saying as 'Plain living leads to high thinking;' and no matter what the advocate of a mixed-food diet may say to the contrary, there is no disputing the fact that the nearer one gets to the mono-diet the better the health will be. At any rate, there is no necessity to mix together those foods that radically disagree, as milk and meat, or acid fruits and starches.

THE LAST OF HER LINE.

By OSWALD WILDRIDGE, Author of *The Luck-Penny*.

I.

ON the word of the wise man we have it that the race is not to the swift nor the battle to the strong. But there are exceptions, and no more convincing example can be cited than the famous China tea-clipper known in the time of her sovereignty as *Cutty Sark*, and now concealing her identity from the multitude under a foreign name and a foreign flag. Her speed she proved in the days of her youth; her strength is surely established by the fact that last year, the year of her jubilee, found her still engaged upon her lawful occasions, the sole survivor of the clipper fleet. The Suez Canal, by the way, was formally opened in the same month and year, November 1869, wherein *Cutty Sark* abandoned the builder's yard for the waters of the Clyde at Dumbarton, and so became in very truth a ship. She remains, moreover, one of the eccentrics of the ocean, still living up to her peculiar reputation for getting into scrapes—and getting out of them—deliciously blending the direst luck with most excellent fortune. Thus, in the light of her strange adventures, it is quite in accordance with the fitness of things that she should have survived the abounding perils of German malevolence, and then crowned her career by such an arrival in the Mersey as the one to be presently chronicled.

Concerning *Cutty Sark's* position in marine history, it may be, of course, that some of the experts would dispute the judgment which awards her pride of first place among the clipper fleet, but the consistency of her sailing should alone be sufficient answer to the challenge. There is also that wonderful record of 362 and 363 miles on successive days, and her average of 75 days from Sydney to the Downs on eight successive voyages; and without in any sense decrying the greatness of *Thermopylae*, *Serica*, *Taepting*, and the rest, there is the paramount fact of her survival. Beyond this, again, it may be said of her that, given her own wind, she is probably the fastest sailing-ship ever built; and it is also part of her story that she has outlived not only all her winged sisters, but many of the monarchs of steam as well. Nor does this

exhaust the account. Up to a very few years before *Cutty Sark* was launched steam was still regarded by all except the men of vision as the handmaiden of the wind-jammer rather than its rival—'auxiliary steam' was the limit of their expectations; but within the lifetime of the famous clipper the handmaiden has become the mistress, the single-gear engine has been deposed by the compound, the compound by the triple expansion, triple by quadruple, the turbine has come into its own, now coal is capitulating to oil and electricity, and the aerial cruiser is winging its prophetic way through space. To say that she witnessed the decline and fall of the *Great Eastern* is only a trifle, for Brunell's monster was, after all, but a freak, and doomed to a premature end. But there is something profoundly impressive in the circumstance that during the round of these fifty years a vast armada mechanically propelled has had its day and ceased to be. While *Cutty Sark* has still kept the sea, many liners of high degree, each in turn acclaimed as the last word in marine architecture, have worn themselves out, all the famous Guion Line boats have passed, the *Alaska* and the *Arizona*, those other twins of high degree the *Umbria* and the *Etruria*, the first *Oceanic*, *Britannic*, and *Majestic*, ironclads, cruisers, gunboats, not one of them mastered by wind or sea, by fire or shell, but all exhausted by the swift life, and handed over to the ship-breakers to be torn rib from rib and plate from plate.

II.

Compared with the leviathans of to-day, *Cutty Sark* is one of the pigmy craft. Her measurements leave one quite unmoved; tonnage 963 gross, length 212 feet, beam 36, depth 21; and even a statement of her gigantic spread of sail and her prodigious spars is charged with little of the quality of magnitude for a race which has learned to reckon energy in terms of horsepower and volts. Her speed records, too, are unfortunately inconclusive—there are so many gaps, so many great beginnings broken by disaster—but withal there is sufficient to convince, and her supremacy is never in doubt. On her maiden voyage home with tea she did the passage from

Shanghai to the Thames in 110 days, this being reduced later to 104; and also we have Sydney to the Downs in 67 days, London to Sydney 68, 74, 75; London to Melbourne 78, and, surpassing all, that voyage in which she logged well over seventeen knots! On these terms she would outsail any of the average modern tramp-steamers, and even a few of the mail-boats would find it hard to shake her off.

But, after all, in tracing her history throughout its romantic range it is her disposition to ill-fortune that impresses, rather than her gift of speed. The thing is almost uncanny. Accident runs with such unflinching resolution that it savours of design. At the very beginning, while she was yet being moulded on the stocks, a malignant Fate would seem to have singled her out as a target for its slings and arrows, and in the light of what followed folks of superstitious bent may discover a certain sinister significance in the failure of the builders commissioned with her construction to finish their contract. No sooner had she been handed over to the charge of the seas than the attack became direct. Outward bound on her maiden voyage, she had some of her top-hamper carried away, and it was probably through no other reason than this that in her first race home with tea she secured only third place.

Through the round of the next season she appears to have passed unscathed and also uneventfully; but then, in 1872, came her ever-famous race with *Thermopylae* from Shanghai to the Thames, and the accident which robbed her of victory, yet served to demonstrate her quality more positively than a conventional arrival so many hours ahead of her rival. Her defeat was her greatest triumph. It applied a test of its own. The supreme fact in that epic contest, wherein the ship was stripped by storm of her rudder and left at the mercy of tempestuous seas, is not her failure to win the race, but the heroic seamanship that saved her from destruction, and then actually sailed her into the Downs on the heels of her successful antagonist. Long before the assembling of the clipper fleet in the tea ports—months before, in fact—it was recognised that this time the issue lay between two ships only, that *Cutty Sark's* challenge was meant for *Thermopylae* alone, and right from that tense moment when the sails were shaken out in the China Sea until they were looped in their gaskets off the mouth of the Thames, even when the challenger was beating along like a lame duck, none other could be said to share the enterprise. And what a race it was! No swift rush through terrific hours and days, but weeks and months of never-renting strain, of ceaseless vigil, of intrigue with the winds of heaven, and withal an ever-present consciousness of dependence upon forces beyond the power of man to control. Months of it, storm nearly all the way, and then, with the second month almost gone, that traditional ill-luck once more flung itself across the

track of the gallant little craft. She was magnificently shouldering her way through a heavy storm when a big sea carried away her rudder, stern-post and all, and there, with *Thermopylae* well behind, she wallowed helpless and in imminent peril. But it was more than a ship that the sea had attacked. The battle was also with men, a tough crew armed with thew and sinew and dauntless courage. And so, in spite of the tempest and the rudder that had gone, *Cutty Sark* was brought round with her boom pointing into the eye of the wind, and for six days she lay there hove-to while they fashioned a jury-rudder, and by the exercise of surpassing skill worked it under the stern and fixed it securely in its place. After which the captain resumed not only the voyage, but the race as well, driving the barque with as much determination as though *Thermopylae* were only a matter of lengths ahead of him instead of half-a-dozen days. For a month the jury-rudder held, but at last the strain began to tell, and for a second time the ship was hove-to, the rudder unshipped and hoisted inboard, and again that tremendous task of placing it in position on the high seas was carried out. And still Captain Moodie refused to admit defeat. Clearly believing that a race is never lost until it is won, he once more crowded on every inch of canvas his ship could carry, and so finely did she sail and so well was she handled that she made her landfall less than a week behind her more favoured rival. And for these things is it claimed that *Cutty Sark's* failure was a greater triumph than success.

III.

In this strain, then, the tale goes on, history provokingly persistent in its repetitions, a budget of splendid speed achievements ever bracketed with a complementary budget of misfortunes. Of the one, it is sufficient to point to her wonderful runs on the Australian route; concerning the other, to mention that terrible night when she was beset by storm off the Goodwins and literally plucked from the jaws of destruction. The next episode of note in her career came in 1895, when she passed from the ranks of the British Mercantile Marine, and, changing her flag, also changed her name, this double event being contingent on her sale to the firm of Messrs Ferreira of Lisbon. But the transfer brought her no relief from the pursuit of that malicious spirit which ever showed itself willing to wound but reluctant to slay. Sailing as the *Ferreira*, she drove ashore near Pensacola in a hurricane; some time later, when bound from Pensacola to Rio with lumber, she stranded again and sustained heavy damage; off the east coast of Africa she had all her masts blown out of her.

For such a ship the tocsin of the Great War must surely have sounded as the knell of doom, foretelling her certain banishment now to the Port of Missing Ships. So far as I am aware,

however, while the navies of the world were being remorselessly sunk, captured, and blown up, she passed through it all without so much as a scratch to her well-worn paint, never touched the horn of a mine, or got across the track of a torpedo. At any rate, if anything did happen to her she said nothing about it, and hitherto no song has been sung concerning the impish trick that was played while the war was still raging. It was during the later phase of the conflict that, being despatched to the west coast of Africa, she was compelled to lie for some time off its dangerous surf-barred sands with anchors down and a long length of cable veered out. As every sailor knows, it is an ugly spot for a ship under the most favourable of circumstances: no suggestion of a roadstead, doubtful holding-ground, and exposure to the full sweep of the Atlantic combers. A deadly haven indeed, the graveyard of many a stout craft. At the outset, however, it looked as though luck was this time ranged on the side of *Cutty Sark*, for she finished her loading without any misadventure. But no sooner was the cargo under hatches than the Storm King trailed across the horizon a signal that no captain of experience could afford to ignore. Giving no time for second thoughts, no time to prepare for flight, it insisted that *Cutty Sark* must stand not upon the order of her going, but go at once. And so, instead of risking his ship, the captain sacrificed his anchors, and spreading his canvas, fled from that sinister coast into the spacious roominess of the sea's highway.

The next act opened off the mouth of Liverpool river a few weeks later, an act of tragedy for the barque, of golden drama for the tug that offered her steam, and of comedy for the looker-on. Cruising in that one-time happy hunting-ground of the tug between the North-West Lightship and Point Lynas, the captain of the *William Joliffe*, one of that squadron of Mersey tugs whose exploits have won them fame in every port in the world, sighted the incoming windjammer, and, of course, tendered the service of his engines. A bout of the usual chaffering over the terms took place, but in the end a bargain was struck, the hawser passed and made fast, and the tug bore away for Liverpool, her skipper, by an odd mischance, being utterly in the dark as to those missing anchors, and regarding his task as an ordinary act of towage of the most humdrum type. Within the limit of his knowledge, all that circumstance demanded was that he should haul the ship up the river, put her to an anchor in the great lagoon known as the Sloyne, leave her there for a few hours until the tide made, and then conduct her to her appointed dock. And up to the point of arrival in the Sloyne this was exactly what befell. Afterwards came revelation, then dismay, and lastly jubilation.

Passing through the bottle-neck gap abreast of the landing-stage, the tug called upon the barque to get her anchor ready; whereupon she

announced that she had none on board, was as helpless as though she had again lost her rudder. There was no mistake about it. The answer was free from any ambiguity: 'Got no anchor.'

Now, according to the law of the sea, the tug's first duty is to her tow, and although the High Court of Justice has laid it down that under given circumstances the law of self-preservation shall prevail, this was obviously not a case for its application. The tug must hang on. Adrift on the river, the clipper would be converted at once into a terrible engine of destruction. There was no telling how many ships she might sink, how many lives wipe out, before she ended her own career either on the bed of the Mersey or on one of the great banks. To the man on the bridge of the *William Joliffe* it was clear that he must either conduct her back to the sea or else shepherd her there in the river until the return of the flood and the opening of the dock gates. This, at any rate, was the first dismal impression. Second thoughts were distinctly brighter. The barque was beyond control, and so she must remain until equipped with another anchor or prisoned in dock. The deduction was beyond dispute. This was not towage, but salvage. The nuisance had become a prize. Whereupon the skipper 'blew five whistles' for another tug, and the *Canada* making response, the pair of them played the part of the lost anchors until the tide relieved them of their charge. And that was how *Cutty Sark* came once more to the Mersey in the time of the Great War. A lucky escape at one end of the voyage transformed into a bill for salvage at the other.

IV

Once, and only once, have I had the joy of meeting the famous clipper, and that upon a day of imperishable memory, a day enriched by a vision of the *Lusitania* sweeping through the jaws of Liverpool Bay, and crowned at eventide by a glimpse of the beautiful ship which Britons will ever deal with as *Cutty Sark* in spite of the yellow-painted *Ferreira* on her hull. Aboard one of the Liverpool tugs, the *Trafalgar*, if memory serves aright, we had trafficked all through the day, partly on the pent-up waters behind the river-wall, partly in the open, canting ship, doing a bit of transfer-work, acting as errand-boy to a first-class liner, 'putting a ship to the stage,' with a few other tasks thrown in; and finally we had been despatched on a mission out by the Bar Light. It was a day of veiled sunshine and everywhere a dower of gold. We sailed beneath a burnished arch on the plain of a molten sea, and all the land was tucked away from sight behind a drapery of tawny gauze. Except for the beat of our own engines, it was a soundless world, too, the sea hushed and the winds asleep. Not a whisper until the *Lusitania* lifted up her voice. 'Brr-a-ay, Brr-a-ay, Brr-a-ay,' it crashed, an imperative command

to all other craft abroad upon the Bay. 'Make way,' it cried; 'make way. A clear road. Way for Her Majesty.' Again it rose, the full-throated blare of an ocean liner under way, that sonorous call which must surely live for ever in the memory of those once privileged to hear it. And then we caught the booming of her engines, the swirl of the waters sliced by her knife-like stem, and at last from the core of the gossamer web she launched herself, a flashing, roaring, smoke-erupting monster; and as, in all her pride of strength and power, of speed and grace, she passed us by, I heard the skipper worshipfully murmur, 'Isn't she a wonder?'

Pitching in the maelstrom of her wake, we went ahead towards the haven she had left, and in the darkening hours came to our berth in one of the docks. And there, lording it over the nondescript company that crowded the basin, was that weary-looking barque whose sovereignty declared itself through all the stains of much travel and the searing marks of many years.

Her presence had none of that glorious thrill of surprise which so happily befell the officer at New Orleans whose delightful story Mr Basil Lubbock sets forth in his *China Clippers*. With us there was no bell to scrape before we could establish her identity—we approached with full knowledge of the meeting, but in no wise was expectation disappointed. In all that realm of the Mersey docks there was nothing quite so weebegone, nothing so pathetically symbolic of fallen greatness, and assuredly nothing quite so majestic. And as I revelled in the spectacle, her spars, still lofty despite the length they had lost, her yacht-like entrance, all the grace of her moulding, the fluted lines of the 'cutty-sark' worn by the figurehead witch imposed beneath her boom, the benediction passed upon the great Cunarder offered itself for another fitting application. Indeed, to-day, fifty years and more since her birth, recalling the glory of her high adventure and her conquest of the years, I am not so sure that she is not the greater wonder of the two.

THE TRADE OF ENGLAND.

By DOUGLAS CARSEWELL.

THEY are running down the tideway, and they're laden'd to the line;

They have cargoes for the Congo and Japan;
Big liners for the Indies, black colliers for the Tyne—

And they're English, all are English to a man.
They are standing down the tideway with the river at the flow,

And the purser's in his cabin writin' logs,
But the capt'n told the bo'sun (and the capt'n oughter know)—

Sez the trade of England's going to the dogs.

There's a large and lordly liner sailing out for Singapore,

There's a lubber full o' ironware from Leeds,
There's a ship for ev'ry haven set around the world's shore—

And they carry in their holds a world's needs;
Oh, they carry each a fortune in their cargoes down below,

While the purser's in his cabin writin' logs,
But the capt'n told the bo'sun (and the capt'n oughter know)—

Sez the trade of England's going to the dogs.

From the narrow muddy reaches of the Medway and the Thames,

Through the shallows of the Channel to the deep,
They have led the way of empire with their burly iron stems,

And the lead that they have conquered they will keep.

From the docks and quays of Deptford to Dunedin and Quito,

From the tropics to the white Newfoundland fogs—

But the capt'n told the bo'sun (and the capt'n oughter know)—

Sez the trade of England's going to the dogs.

You can hear their sirens booming as they labour up the sound,

You can see their smoke-rack rising on the bay;
Their hulls are low and rusted, they have been the world round,

And they've traded ev'ry haven on the way.
They have sailed the Sea of Banda, where the sago-palm trees grow,

They have plunged around Fuego with its fogs;
But the capt'n told the bo'sun (and the capt'n oughter know)—

Sez the trade of England's going to the dogs.

There are troopships in the tideway—you can hear their engines beat,

As they bear away the best of England's sons.
While from seaward comes the thunder of a mighty battle fleet,

As the swinging turrets shudder to the guns.
'Tis the might of England brooding for that hour when the foe

Shall fare him from his minefields and his fogs—

But the capt'n told the bo'sun (and the capt'n oughter know)—

Sez the trade of England's going to the dogs.

God of empires, you have call'd us, and we've answer'd to a man,

And we've stood for Right and Freedom from the first;

We have done what never nation of the world did—or can.

Shall we lose it to the alien we have nurs'd?
God of empires, you who call'd us, in your wisdom you may know—

But the purser's nearly written up his log,
And the capt'n and the bo'sun in the lazarette

alow,

Are a-thrashing out the question over grog.

Chambers's Journal

SEVENTH SERIES

THE COMMON ROUND OF SHAKESPEARE'S LONDON LIFE IN 1591.

By HENRY E. BANNARD.

I.

IT is by no means impossible to reconstruct a picture of Shakespeare's daily life in London about 1591. We know that he was then engaged at James Burbage's Theatre in Moorfields, and he needed to lodge in a part of London which was at no great distance from Moorfields. We know, too, that at a later period of his life Shakespeare lodged at the house of one Mountjoy, a Huguenot refugee. This house was at the corner of Silver Street, off Cheapside. It is quite possible that he may have been there in the early days of his London life also, and at any rate that neighbourhood was then highly convenient for him.

In Tudor times Londoners, in common with other English folk, were early risers. Breakfast most often consisted of beef or bacon with ale, which was drunk at practically all meals, there being no tea or coffee to vary the menu. There were, of course, wines of various kinds, notably sack, which figures prominently in the Bacchanalian scenes in which Shakespeare so frequently places Falstaff. Wooden plates and trenchers were used for the food, which was eaten with knives and fingers, the use of forks not being introduced from Italy till c. 1614. As dinner was taken about eleven o'clock, and the performance at the theatre was usually at three o'clock, the early morning between breakfast and dinner would be that portion of the day which Shakespeare found available for his own special purposes. This, in all probability, was the time at which he was accustomed to write, as the hours immediately after breakfast were the only ones in which, as a rule, he could be free from interruption; and, moreover, for half the year the poorness of the artificial lights of the time rendered it a matter of much physical difficulty to write in the evening.

But it must not be assumed that he had the whole time between breakfast and dinner for composition. Far from it; for there were many things that called him away. Often in this busy year of 1591 he must have found it necessary to go in the morning, either alone or with Burbage and others of his colleagues, to see how the construction of the Rose Theatre was progressing, and to consult Henslowe on some point

or other connected therewith. From his city lodgings there were two almost equally convenient routes by which he could go to Southwark and Bankside. He could either walk all the way, crossing the river by London Bridge, then not only a busy thoroughfare, but also a great centre for shopping, shops and houses being built on the bridge; or he could go past St Paul's and down Ludgate Hill to the ferry, and cross the Thames in the ferry-boat. Not infrequently, no doubt, he devoted some of the morning hours to waiting on his patron and friend, the Earl of Southampton. The peer's town-house was close to the present corner of Chancery Lane and Holborn, and Shakespeare's route thither from his lodgings was down Holborn Hill, the well-remembered road by which he had made his first entry into London. Or on occasion he may have gone to see the earl at his chambers at Gray's Inn, for Southampton entered as a student there, immediately after he had graduated at Cambridge, in order to study law sufficiently to fit him for the duties of a great landowner and a magistrate. Gray's Inn was at this time the most fashionable of the Inns of Court, and the great Bacon was then laying firm the foundations of his legal reputation there.

Many brilliant and interesting people were to be met at Southampton's rooms. It is all but certain that Shakespeare early met Florio there, for he was the earl's tutor in Italian. John Florio was the son of Michel Angelo Florio, who, becoming a Protestant, migrated from Italy to England, and was for many years a popular preacher in the city of London. It was currently believed, however, that this popularity was due not so much to the acceptability of his doctrine as to the fact that his preaching in Italian afforded many fashionable people an excellent opportunity to make themselves acquainted with the correct pronunciation of that language. His son John quickly made a good position for himself as an instructor in both French and Italian, numbering among his pupils members of the wealthiest and most influential families of the time. At this moment he was busy preparing his great Italian-English dictionary; it was not till a few years later that he made that translation of Montaigne which has done most to keep his

memory green. It appears probable that Shakespeare took lessons both in Italian and in French from Florio. The scene in *Henry V.* in which Katharine of France teaches French to King Henry is written with an evident and humorous knowledge of the pitfalls that beset a learner, whether of the French or the English tongue. As for Italian, Sir Edward Sullivan, in an article in the *Nineteenth Century and After* for January 1918, gives good grounds for the belief that Shakespeare had not long been writing plays before he was able to read Italian. Certainly the dramatist might have learned Italian or French from some other teacher than Florio; but considering the close intimacy between Southampton and Shakespeare, and between Southampton and Florio, it is exceedingly unlikely that Shakespeare sought any other teacher, when the most popular of all was a member of a circle which he himself frequented and adorned. On some mornings of the week Shakespeare would be likely to wend his way down either Ludgate Hill or Holborn Hill to Florio's rooms in Shoe Lane. It is curious that the lane which to-day is associated with newspapers and printing was even then a resort of writers. It was a district intersected by streams—the Old Bourne, whence Holborn is supposed to derive its name; and the Fleet stream, the memory of which is preserved in Fleet Street, into which Shoe Lane now runs at its southern end.

So much for Shakespeare's mornings in the London of 1591. Writing his plays and poems at his lodgings, visiting the Earl of Southampton at his town-house or in his chambers at Gray's Inn, taking lessons in Italian or French from Florio at his house in Shoe Lane, or sharpening his naturally keen business wits by talk with Henslowe, either at the growing fabric of the Rose Theatre or at his dyeing or pawnbroking establishments at Southwark, probably accounted for most of Shakespeare's weekday mornings at this period.

II.

By eleven o'clock he was back at his lodgings for the substantial midday dinner of meat and ale with a pie or a pudding, as was general among the business classes. Soon after dinner he would have to make his way to the theatre in Shoreditch. To get there he had to leave the city boundary at Moorgate or Bishopsgate, and pass through Finsbury. The city man of to-day, desiring to go to Shoreditch, can do so by tube, or by bus or taxi-cab along busy and crowded streets all the way. Not so the London citizen of Elizabethan times. As soon as he emerged from the city, he found himself in waste ground of an unseavours nature, very muddy, and full of rubbish of every description. The sole marks of civilisation were the raised footpaths constructed to enable passengers to negotiate the pitfalls of huge refuse-heaps, deep black ditches,

and foul open sewers. Along such a path, accompanied often by his colleagues Heming and Condell, who lived within a stone's-throw of his lodging, Shakespeare had to walk to the theatre. We have a reference by him to Finsbury in *Henry IV.*, Part I., Act i., Scene 1, where Hotspur tells his wife that she gives

Such sarcenet surety for thy oaths,
As if thou never walk'st further than Finsbury.

Similarly there is a reference to Moorfields in *Henry VIII.*, Act v., Scene 3:

Is this Moorfields to muster in? or have we
Some strange Indian come to court?

Also in *Henry IV.*, Part I., Act i., Scene 2, Prince Henry asks Falstaff:

What sayest thou to a hare, or to the melancholy of Moor Ditch?

It was at Moorfields that the theatre was situated, and the Curtain Theatre was in Shoreditch, where Curtain Road perpetuates its name. Very queer characters, on various queer ends bent, congregated in this derelict neighbourhood. It was not by choice but by necessity that Burbage had erected his theatres on so unsavoury and badly accessible a site. It seems to have been the only site available at the time, when the city authorities (more, perhaps, from fear of crowds than from dislike to acting and actors) refused to allow a theatre to be established within their bounds. Hence it was that Henslowe's project of the Rose Theatre on Bankside offered the prospect of improvement for the company. Executions were carried out at Moorfields close to the theatre. We know of at least one such execution taking place on 5th October 1588, when William Hartley, a secular priest, suffered. (*Vide T. G. Law's Calendar of English Martyrs, 1535-1681.*) If there was one such hanging at Moorfields near the theatre, there were probably more, though the bulk of London executions took place at time-dishonoured Tyburn. The sight of such barbarities may well have vexed Shakespeare's tolerant soul, and deepened that intense love of mercy which so often finds expression in his plays.

The wonder is that a theatre established in such a neighbourhood was able to attract audiences at all. Such audiences as there were probably consisted in large part of roughs and idlers, and gay and rowdy London apprentices, who made a playground of Moorfields, and, some years later, rioted because of the proposal (which, despite their violent opposition, was happily carried out) to drain Moorfields, and to bring some slight measure of sanitation and decent control into the abominable place. But, happily for Burbage and his fellows, this rabble was not the whole audience. There were also the exquisites, the rich and often noble young men about town, such as the Earl of Southampton, who were consistent patrons of the theatre, and were its mainstay financially. Young and

adventurous, they feared no perils of Moorfields or elsewhere, and going there together in company with retainers and serving-men, they were only too ready for any rough-and-tumble fight which might befall them on the way.

The players—Shakespeare, of course, among them—probably reached the theatre as a rule about noon. Between noon and three o'clock, the usual time for the performance, there were the hundred and one tasks incident to theatrical preparation to accomplish.

The tedious and exacting business of rehearsals was presumably carried out in those hours between noon and the opening of the theatre to the public. There would be various business arrangements to be transacted and, perhaps, purchases to be effected; and, at any rate in the earlier days of his professional career, Shakespeare would have to order and superintend the lads whose task it was to hold the horses of those who rode to the play, there probably being solid reason for the tradition of a group of horseholders being known as 'Shakespeare's Boys.' The costumes of the actors had to be laid in readiness in the tiring-hall at the back of the stage, the equivalent of the modern dressing-room; the pine-sprigs had to be laid on the floor beside the better seats for the gallants to lay their cloaks upon; and the supply of juniper-berries had to be placed in readiness to burn for purposes of fumigation whenever the atmosphere became too offensive through the presence of the many insanitary and unpleasant persons who swarmed there.

Between two and three o'clock the theatre was opened. The money had to be taken at the doors from wealthy and poor alike, there being nothing in the way of tickets or ticket-offices then. The auditorium was for the most part roofless. The lowest class of playgoers paid a penny for the privilege of standing in the yard, represented nowadays by the pit. The best seats of all were those in proscenium-boxes on each side of the stage. For seats there the charge was often as much as twelve shillings. There was nothing in the way of scenery, the character of the scene being frequently indicated by a notice stating whether it was a castle, an inn, or a ship. It is a moot point whether the acting was not better without scenery than it has been with the elaborate scenery of modern theatrical enterprise. Certainly the imagination of the spectators must have been more stirred, seeing that there was so much greater scope for its exercise. Already, however, considerable expense was gone to in the way of costumes; it must, indeed, have been the principal item of expenditure in the Elizabethan theatre.

The performance seldom lasted for more than two hours. Soon after five o'clock the theatre would be emptied, and for another hour the actors would be occupied in superintending the tidying up, and then they wended their way

homeward, the perils of the noisome way being increased in winter evenings by the darkness.

III.

Tavern-life was a great feature of London in Elizabeth's reign, and it seems unlikely that many evenings were passed by Shakespeare and his fellows when in town without visiting one or other of the inns of the city. The name of the Mermaid Tavern is, of course, familiar to every one. The 'Mermaid' was in Bread Street, off Cheapside, and it had side-entrances—one from Bread Street itself, and one from Friday Street. Tradition has it that Sir Walter Raleigh founded the Mermaid Club at the Mermaid Tavern, and Ben Jonson became the leading spirit of the company of wits and men of letters who were wont to assemble there. Shakespeare is always assumed to have been a member of it, but we have no proof that he was; on the other hand, we have no proof that he was not. The most we can say is that the probabilities are that he was often one of the number that met there nightly. In 1591, however, the Mermaid Club had not yet blazed into glory, though the tavern was in existence, and was doubtless frequently visited by Shakespeare and others.

The Devil Tavern, in Fleet Street, was another famous resort of the 'tribe of Benjamin,' but although we know it was flourishing early in the reign of James the First, it is not clear that it was yet opened in 1591.

The 'Mitre,' in Holborn, was undoubtedly in existence then, and there seems good reason for supposing that it was one of Shakespeare's houses of call. It may be seen to-day in a little court just off Ely Place, hard by the beautiful church of St Etheldreda. It was originally a hostelry in connection with Ely House, the town mansion of the Bishops of Ely. It will be remembered that Shakespeare, in *Richard III.*, reveals his familiarity with the fine strawberries that were grown in the bishop's garden at Ely House, Holborn.

The 'Boar's Head,' Eastcheap, was another much-frequented tavern, and Shakespeare himself has immortalised it as one of the haunts of Falstaff. An hour or two in the evening would thus be spent in finding in one or other of these taverns relaxation and stimulus in the play of conversation and repartee with some of the brightest brains of the time, though there was none among them that saw so deep or could frame his expression of what he saw so well as the young player from Stratford-on-Avon.

Occasionally the company were engaged to play at the houses of some of the great people of the age, and from time to time they found a lucrative engagement in playing at the Inns of Court. We know, for example, that comparatively early in Shakespeare's career the first performance of his *Comedy of Errors* was given in the hall of Gray's Inn. We may conjecture

that the Earl of Southampton, who, as above noted, was a member of Gray's Inn, had something to do with this engagement.

IV.

On Sundays Shakespeare undoubtedly attended church once a day at least. He may very well have done so usually from inclination; but whether he wished to do so or not, he would go to church, and avoid the fine which was exacted from all who absented themselves from service without due cause shown. He would attend the church of the parish in which he was living.

One wonders how Shakespeare spent his Sunday afternoons. He may often have refreshed his spirit with rural scenes by a walk out to Islington, Edmonton, Hoxton, or Tottenham Court, for all these now thoroughly metropolitan areas were then in the heart of the country. At this comparatively early period of his London life it is probable that, in common with other young men, he spent a certain amount of time on Sundays in shooting-practice as a member of the city trained band. He very likely, therefore, on Sunday afternoons walked across the Finsbury Fields to Islington, where the archery-practice was carried out. With the development of guns, archery was on the decline; but there was still a great deal of it, and the Act compelling men of military age to practise archery on Sundays and holidays was still in force. It would almost certainly be on the Finsbury Fields ground that Shakespeare did his archery-practice. The proximity of this ground to the heart of the city made it the busiest and most frequented of any. There were large numbers of targets representing various distances of range. Many of them bore specific nicknames, which had presumably been given them for one reason or another, such as the prowess of some particular individual archer, or some amusing incident or witty remark. Thus among these targets were some bearing such strange names as Lee's Lion, Beswick's Stake (possibly reminiscent of some match shot for a wager), Lurching, Nelson, Sir Rowland, Dunstan's Dapling, Lambert's Goodwill, Martin's Mayflower, Lee's Leopard, Mildmay's Rose, Thief in the Hedge, Silkworm. All these names, and others also, are given in the quaint tract, *Ayme for Finsbury Archers*, which was printed in 1594, so that these were among the names of the targets at which Shakespeare was accustomed to shoot in the early part of the last decade of the sixteenth century. The yew bows in use were of great strength, and the arrows very long. The standard of shooting was high, for men of twenty-four were prohibited from aiming at any mark at a shorter distance than 220 yards, or eleven score, the score being the standard of reckoning on the archery-grounds.

The maximum range was nineteen score or 380 yards. There being public thoroughfares across Finsbury Fields, the archer had to shout 'Fast!' as a warning to pedestrians before he shot an arrow, and if he could prove that he had given this warning he was not held responsible at law for any mishap that his arrow might occasion to an incautious traveller or spectator. One can fancy Shakespeare shouting 'Fast!' in this way, like a modern suburban golfer calling 'Fore!' before he makes his stroke.

When he had finished his practice, he could, if he were so minded, find a change of occupation and pastime in one of the bowling-alleys, of which there were many in the neighbourhood. We have plenty of evidence in Shakespeare's plays to prove that he had an intimate knowledge both of archery and of bowls.

V.

An important factor in the growth of Shakespeare's popularity and in the widening of his experience was his acquaintanceship with certain high and cultivated ladies of quality. It was not till a few years later that the frequency of his appearances in plays performed before the queen made him intimate with numbers of Court ladies, but already in 1591 it seems likely that there were high-born ladies who appreciated his genius, and who showed him some measure of friendship. One such lady was the Countess of Southampton, mother of his friend the earl; and it is probable that he had also some acquaintance with the Countess of Pembroke, who was a munificent and discriminating patroness of the arts. It is possible, too, that he may have met with kindness from one or other of the six noble ladies to whom Florio dedicated his translation of Montaigne's *Essays*—namely, Lucy, Countess of Bedford; her mother, Lady Anne Harrington; Elizabeth, Countess of Rutland; Lady Penelope Rich; Lady Elizabeth Grey; and Lady Mary Nevill. Every such new acquaintanceship afforded a fresh link with Renaissance culture, of which the poet took full advantage. By this time it is to be presumed that Shakespeare was beginning to be a buyer of books. We know that he did form a small library of books, as it is on record that some years after his death his granddaughter, Lady Barnard, was possessed of them. From the gifts of the Earl of Southampton—for we know that he was a generous benefactor to Shakespeare and other authors—he must have had much assistance in the buying of books that he needed or fancied. The book-trade had developed greatly during the reign of Elizabeth.

We may assume that when Shakespeare came to London from Stratford he was thoroughly familiar with the Bible, and with such classical writers as Ovid and Virgil and Horace—more particularly with Ovid. After he left school

he does not appear to have kept up his Latin to any extent, although now and again he airs little bits of Latin, as well as of French and Italian, in his plays. His time, as we have seen, was very fully occupied, and, like many another busy man, he found it simpler and more suited to his purpose to read foreign authors in a translation than in the original. Internal evidence in his plays indicates that he made considerable use of Golding's translation of Ovid's *Metamorphoses*, which was published between 1565 and 1567.

There was already a considerable number of bookshops in the city of London that Shakespeare had opportunities to inspect. He was, of course, familiar from the earliest days of his arrival in London with the printing-shop of his fellow Stratfordian, Richard Field, and it was Field who published Shakespeare's first printed book, his poem of *Venus and Adonis*. In St Paul's Churchyard there was an array of bookshops. One bearing the sign of the 'White Greyhound' was kept by John Harrison, who in due course published Shakespeare's second poem, *The Rape of Lucrece*, which had also been printed by Richard Field. There was likewise the 'Lamb,' founded by Abraham Veale in 1546, and the 'Resurrection,' in 1547, by John Daye, who added the witty explanation to his sign, 'Arise, for it is Daye.' The 'Crown' in St Paul's Churchyard 'at Cheapgate' was opened in 1584, and was for very many years used as a bookselling and publishing office by Simon Waterson, and by his son after him. Here also was the 'Tiger's Head,' which was doubtless much frequented by Shakespeare, as there were published and sold the works of Chapman and Massinger, Beaumont and Dekker. Hard by in Paternoster Row was another 'Tiger,' the famous house of Christopher Barker, from which successive editions of the Breeches Bible were issued.

We may well suppose that often, after a long saunter among the bookshops of St Paul's Churchyard, Shakespeare would drop in for bodily refreshment and mental relaxation and amusement to the hostelry of the 'Castle' in Paternoster Row, which, until his death in 1588, was kept by the famous comic actor, Richard Tarleton, whose position in the Elizabethan world may best be understood by modern readers if we describe him, as we can with truth, as the 'Charlie Chaplin' of his age.

The above is an approximate reconstruction of the general character of Shakespeare's daily life in London in those years when he had found his footing and secured the prospect of a decent livelihood, but when he had yet to attain fame in more than a comparatively small circle. Already in 1591 he was busily writing that noble tragedy of *Romeo and Juliet*, which was the first of his works to reveal him as head and shoulders above all his contemporaries. Had only the plays written before *Romeo and Juliet* been preserved for posterity, we should have known something of the great promise there was in Shakespeare, but we should have had no adequate conception of his real greatness; and he would hardly have stood out markedly in the ranks of such contemporary writers as Marlowe or Peele or Kyd or Greene. If, on the other hand, *Romeo and Juliet* had been preserved, and all the later plays lost, whilst we should still have had an inadequate idea of Shakespeare's range and power, yet we should have been able to recognise in *Romeo and Juliet* one of the greatest of all achievements in literature, and should have known the author thereof for one of the supreme geniuses of the world. Of such cardinal importance is this tragedy in the life and work of Shakespeare, and in the making of his fame.

THE SNAKE.

By G. TREVOR ROLLER.

WHEN the wind blows up the rain in Mexico it can be very cold, even though you be on the edge of the hot country. Down the Balsas River, where the cactus-belt meets the scrub oak, are various rest-houses at intervals of ten miles or so along the high-road. Just two-roomed adobe huts roofed with shingles, they have no care-takers; they stand forlornly, but always ready for the traveller caught by the rain or the night.

On a certain afternoon outside one of these huts stood two dejected ponies, their hunched quarters slewed into the driving deluge; inside, in the front-room, were their owners, two men of the small *ranchero* type. One lay on a straw mat on the floor, a blanket thrown over him,

sleeping; the other sat on a wooden bench, the table before him, staring at the sleeper. They had met that morning by chance on the road, had ridden together for company's sake, and had decided to shelter—the rain would stop in an hour or so. They were apparently strangers. At all events, the sleeping man had never seen the watcher before. But as the watcher sat lowering at the silent form there was recognition in his face—he had recognised the man at the moment of meeting that morning. There was no mistake; he would have known him among a thousand.

He rested his elbows on the table, his chin on his two clenched fists, and his mind went back to the night before; to the narrow cobbled street

with the runnel of water down the middle that shone like a band of silver in the moonlight, the eaves dripping still from the last shower, and a darkened window with a balcony on the second storey of the house opposite. He had stood in a doorway waiting and sheltered from the drops, waiting for the church bells by the *plaza* to toll ten o'clock. Then the window would open and *she* would appear; a word or two, perhaps, a low laugh, and the window would close again, for they were early in the courting and she would be trying his patience. It would be only a moment's vision, but it would send him to his bed very happy; for, after all, was she not the most beautiful of all the women he had ever seen?—and in his small world he considered he had seen many.

The night before last she had thrown him a rose. It fell splash in the runnel, the silver band which was only a sewer really. She had laughed and disappeared, but he had picked it up and thrust it inside his cotton shirt next his bare skin. The thorns pricked him, and it damped his shirt, but not his love—she had worn it. That is the way love madness takes men. But he had been much before his time last night—a quarter of an hour or more. Down the street came a man—large sombrero and *zarrape* wrapped to his eyes—who stopped before the sacred window; so he drew back into the shadow of the doorway. The new-comer coughed twice, then very softly hummed a verse of 'La Paloma,' the Cuban love-song that Mexico has taken unto herself. The window opened, and the light behind silhouetted his divinity. A bare arm swung forward, and a rose circled into the air and fell at the feet of the new-comer, who snatched it up and pressed it to his lips. The window shut with a bang, and this rival walked back up the street. He followed him to a small *tienda*, and there he stood in the shadow and gazed while the stranger drank his *teca* and talked to the owner. The lamp shone on the man, and every feature was impressed indelibly on his rival's mind.

So he went out to the street again, thinking many thoughts. This girl, then, was a coquette; she had led him on, and he had found her out. He took from his breast the now faded rose she had given him. He tore it to pieces. The petals fell on the cobbles at his feet, and he crushed the core of it under his heel. And here he was now sitting and staring at the 'other man,' who slept as peacefully as a child, whilst he watched with rage in his thoughts, wishing he could slide a knife in between the ribs just where he felt sure last night's rose lay hidden. The rose, the ribs, and the man's heart all skewered together! That would be good, but the game was not worth the candle. Ah, *Dios*! why had he fallen in love?

A slight rustle near the door of the other room turned his head towards it. The door stood ajar, as it had done when last he looked. His eyes

wandered back to the sleeper, but another rustle made him glance back at the door, then down to the floor by the door.

Every muscle stiffened, and his first instinct was to throw his sombrero, which he still wore, at the thing that he saw. The next second he felt he must watch, and instinctively and without a sound he drew back his legs and tucked them under the bench, while the back of his neck and his spine tingled, for what he gazed at he feared.

Men who work in the cattle-country of Mexico know the *nulaki* snake, slow, fat, and poisonous; and here was a beautiful specimen, two feet long and very thick in proportion. The reptile had sensed warmth in the other room, and methodically it was seeking it. Slowly the snake wormed its way along the wall of the room towards the sleeper.

The man at the table knew that at a sudden sound—a scraping of feet on the mud floor—if he threw his heavy hat at it—the snake would give up its quest. But his brain worked quicker than the snake's movement, and he sat and watched. The fat brute reached the sleeper lying on his side with his back to it. Then it nosed under the blanket and disappeared, all but the tip of its tail, which just showed in the nape of the man's neck. The *nulaki* does not coil; it was lying along the sleeper's spine.

The man at the table watched the strange bed-fellows, knowing that soon, surely, one would overlie the other, with a bite as the result, and then—— Well, quick medical aid might save the case; a tourniquet above the bite and plenty of alcohol might save the bitten man. The watcher glanced over his shoulder at the saddle lying on the floor behind him. In the saddle-bag was a bottle of *teca*, potent spirit, that might save life, but the sleeper did not know it was there. The watcher could throw his saddle on his pony and gallop for help—and take care he went in the wrong direction for it. He would be rid of a rival, and——

Suddenly the sleeper woke, threw the blanket from him, stood up, stretched, and yawned.

The man at the table gripped it with both hands and went white. He watched the other go over to the mud stove away from his blanket; then he watched the blanket, and saw the slothful, poisonous thing creep out. He scraped with his feet, making a noise, and the brute slithered along the wall to the door of the other room, disappearing as the man who had slept spoke.

'Ah dear saints, what a dream—this stove will never light; it is all smashed up—but what a dream!' Here he turned on the man at the table. 'I dreamt,' he went on, 'that I was being hanged, and the rope was very, very thick. The knot at the back just at the nape of the neck tickled me, and with that I woke up. *Dios*! I do not often dream. Perhaps it was the cold.' He reached down and picked up the blanket and

folded it round him. 'This accursed blanket smells! Bah! it is my imagination and the dream. How I would like a good *copeta* of *teccla* now; but I have none. I seldom travel without it; it is so warming.' And he sat on the useless mud stove and shivered.

The man at the table shivered too.

'What made you dream so terribly?' he asked.

The other pulled tighter at the blanket as he wrapped it round himself.

'Well,' he said, 'last night I played a silly joke on a man I do not know. My wife's sister lives in the street that is called Latran, near the *plaza*. She is a pretty child, and always I have liked to joke with her. But I had heard—while out of town—that she has a *novia*, a sweet-heart. I do not know his name, but he is a worthy man, and her mother approves, and they are only at the beginning of their courtship. Also, I heard that he came to her window punctually at ten o'clock, and she would pass

him a note or what not. And I, like a fool, played a joke on her. I went to the window before the time, and hummed a tune. She came and threw me a rose, being, of course, unable to see me distinctly out in the street, and I went off laughing at the thought of the other fellow coming later, and her believing he had already been. A silly joke to play on her, and very unfortunate for the man. I saw all that this morning. It must have preyed on my mind, for I dreamt that this man had seen me, thought me a rival, followed me, caught me and bound me, and was about to hang me, when the knot of the rope tickled the back of my neck and I woke.'

The man at the table leaned back and pulled the saddle to him, groped in the saddle-bag, and produced the bottle of *teccla*.

'Come,' he said, 'I had forgotten I have this. Let us drink to our better acquaintance, to our friendship. But first I will shut the door of the other room; there is a draught.'

THE ISLAND OF SAKHALIN.

SEPARATED from the mainland of Asia by the narrow Mamia Sound, the island of Sakhalin (Saghalien), or, as it is called by the Japanese, Karafuto, lies in the Sea of Okhotsk between 54° 24' and 45° 59' north latitude, and has an area of some 24,500 square miles. It is for the most part mountainous, and the ranges run parallel to one another from north to south. Some of the tops rise above the tree-line, amongst these being Pormubari, 4250 feet. The coast is, generally speaking, rocky, with occasional tracts of sand, which are strewn with driftwood, seaweed, and wreckage. The island is traversed by a large number of rivers, several of which are both wide and long; there are also some lakes, and in the neighbourhood of the fishing-village of Chipesani, on the south coast, there are three of very considerable extent.

The forests are extensive, and consist mainly of larch (*Larix sibirica*) and spruce (*Abies Sakhalinensis*); but on the lower-lying tracts the elm and the birch are the most numerous represented. The fauna of Sakhalin is very abundant, and exhibits a great degree of similarity with the animal world of the Amur province. This is no doubt partly due to the fact that the Mamia Sound is frozen over in winter, and a convenient bridge is thus formed across which the mammals pass with ease. Among these may be named the reindeer, the tiger, the musk deer, the bear, the wolf, the lynx, the sable, the fox, and the otter.

At certain periods of the year the rivers are filled with salmon, which are captured in vast quantities, and the herring-fishing on the coast is extremely productive.

Sakhalin is inhabited by three more or less

original tribes—namely, the Gilyaks in the north, the Orochons in the centre, and the Ainu* in the south.

Soon after the Russians took possession of Amur Land, northern Sakhalin came under their influence; the southern part belonged to Japan, but in 1875 it was transferred to Russia in exchange for the Kurile Islands. Afterwards Sakhalin was used principally as a place of deportation for criminal offenders, and thousands of Russians from all parts of that huge empire were conveyed thither to lead a wretched existence.

After the Russo-Japanese war, southern Sakhalin was retransferred in 1905 to Japan, which is now doing everything possible to colonise it. The coasts are already pretty closely inhabited by Japanese fisherfolk, who reap rich harvests from the sea and the rivers; but the interior of the island is still a desert.

The capital of Japanese Sakhalin is Toyohara (formerly Vladimirofka); but several other towns are rising up along the coasts, among the most important being Otomari, Marka, and Siska.

Up till now fishing has been the islanders' main source of livelihood, but sooner or later the pine-forests will, of course, be exploited. In connection with agriculture, too, there are many possibilities, but as yet little has been done in that direction. Although the Government offers them land on very favourable terms and various other advantages, the Japanese do not take kindly to farming on Sakhalin.

* These people are generally termed 'Aino' or 'Ainos'; but this is hardly correct. 'Aino' is a nickname, and is always applied by the Japanese to the Ainu. Originally a term of contempt, it means 'mongrel' or 'half-breed', whereas 'Ainu' means 'man' or 'men'.

The way in which the Ainu were induced, about the beginning of the nineteenth century, to settle in increasing numbers on Sakhalin illustrates Japanese wiliness. A party of Ainu hunters had determined on an expedition to the interior of the island, which abounds with wild animals of various kinds. Thanks to the facilities offered by the Japanese authorities, the voyage from Yezo to Sakhalin was made easy, and the hunting-party, which included a number of women and children, was landed on the south coast, whence the journey to the inland forests was begun. The expedition proved highly successful, and a great many valuable skins were secured; but when the Ainu wished to return to Yezo, obstacles were placed in their way, and while they were waiting for a ship Japanese traders turned up, bringing with them plenty of *sake* (a form of spirit distilled from rice). In exchange for this cheap poison they obtained the costly furs, and when the Ainu had parted with these all chance of their returning home to Yezo had disappeared. The whole affair had been planned: the Ainu were left in the lurch, and were compelled to remain on Sakhalin. Other hunting-parties were similarly treated, and in time the small communities which now exist were formed; but every now and again the Japanese merchant makes his appearance, and does a good stroke of business for himself.

Naibutachi is one of the largest and oldest of the villages. It contains about 150 inhabitants. The dwellings are small and low, and the store-houses are supported on piles five to six feet high, so as to prevent the sledge-dogs (with which the place abounds) from getting at their contents. In the open spaces stand groups of whittled wands adorned with the skulls of bears, sea-lions, and dogs. These are in the nature of fetishes, and constitute a feature of all purely Ainu villages. Individually they are called *inao*, and when in clusters *nusa*. They are also to be found upon the seashore where the men push off their boats when going to fish; they are placed there for the gods of the sea, and are called *kema-ush-inao*. The Ainu of the present day are the remnant of a once numerous people who inhabited Japan long before the appearance on the scene of the Japanese. In the oldest Japanese book, written in 712 A.D., the following occurs: 'When our august ancestors descended from heaven in a boat, they found upon this island (Yezo) several barbarous races, the most fierce of whom were the Ainu.'

In the same work reference is also made to a race of dwarfs with whom the ancient Japanese waged war. They are said to have had tails, and to have lived in caves with stone floors. On one occasion the Emperor Jimmu would seem to have had a number of them slaughtered in cold blood. Thus we read: 'When His Augustness made his progress and reached the great cave of Osaka, earth-spiders with tails—namely,

eighty braves—were in the cave awaiting him. So then the august Son of the Heavenly Deity commanded that a banquet be bestowed on the eighty braves. Thereupon he set eighty butlers, one for each of the eighty braves, and girded each of them with a sword, and instructed the butlers, saying, "When ye hear me sing, cut them down simultaneously." And this was accordingly done.'

There is a tradition among the Ainu of Sakhalin to the effect that they are descended from these cave-dwelling dwarfs. If such be the case, the race has improved very considerably, for the Sakhalin Ainu are rather fine-looking people.

Towards the end of May salmon begin to ascend the rivers, and they do so in such vast shoals that many are crowded out on to the banks, where the bears, which are very numerous on the island, feast upon them. In June, July, and August, indeed, these animals live almost entirely on fish—more especially salmon, and on this diet they thrive and multiply exceedingly. The vegetation in the neighbourhood of the rivers is so dense that effective pursuit is almost impossible, but the Ainu hunters have all sorts of contrivances for the capture or the destruction of bears. In connection with these they use a poison so powerful that an animal wounded by an arrow treated with it will drop dead after going only a few hundred yards. Curiously enough, the flesh of a bear thus killed does not seem to be affected, as the Ainu eat it with impunity. The composition of this poison is a secret which the Japanese have in vain endeavoured to find out, and it is handed down from father to son.

On the eastern coasts of Sakhalin the fur seal (*Callorhinus ursinus*) is found, more especially during the herring season. On the island of Kaihy-to and in its neighbourhood this species is protected, and at certain times of the year, therefore, it occurs there in large numbers. This island, which lies in 48° 30' north latitude and 144° 30' east longitude, is rocky and almost entirely devoid of vegetation. Its Japanese name, Kaihjo-to, means 'Fur Seal Island,' and is extremely appropriate. Amongst the professional hunters it was always well known as one of the greatest rendezvous of these valuable animals. When, after the Russo-Japanese war, southern Sakhalin was restored to Japan, the Government of that country at once took steps to protect as much as possible the seals on Kaihjo-to. No shot was allowed to be fired there, no steamship signalling was permitted in the neighbourhood, and any disturbance of the seals was strictly forbidden. The effect of these measures became very quickly apparent, and the seals, which, owing to severe and constant persecution, had diminished in numbers very greatly, have now increased enormously. The annual increase varies, of course, considerably, but it has on the whole exceeded all expectations.

In order to indemnify to some extent the

foreign shipowners for the losses sustained by them owing to the total prohibition of sealing in these regions, the Japanese Government undertook to give them a share in the annual catch. Every year, in the month of June, a Japanese official proceeds to the island in order to superintend the slaughtering of a certain number of seals; and the value of these is distributed among the different Governments for the benefit of the shipowners. The number taken for this purpose varies with the stock in sight, so to speak, and is between 300 and 600 annually.

On Kaihjo-to female seals are absolutely immune, and the victims killed yearly consist mostly of two- and three-year-old males. They are driven in herds to a certain part of the island, where they are clubbed. The slaughtering-time

lasts for three months—June, July, and August—and after that the animals are left entirely undisturbed until June in the following year.

Naturally, of course, the occurrence of the fur seal in Sakhalin waters is not confined to the island of Kaihjo-to, although great numbers of them remain there throughout the spring and the summer months. Many wander far afield—along the east coast of Sakhalin, northwards to Kamchatka, and eastwards to the Kurile and the Aleutian Islands; but nowhere are they so tame as at Kaihjo-to, where they are protected, and are looked after by watchers who live there all the year round. Once a month a steamer brings these men provisions and other necessities. Even fresh water has to be brought from Sakhalin, there being none on Kaihjo-to.

THE PARTS MEN PLAY.

CHAPTER XVI.—*continued.*

III.

FROM the time that Austin Selwyn received the note there was nothing else in his mind—as in Elise's—but the coming meeting. As playwrights planning a scene, each went through the encounter in prospect a dozen times, reading into it the play of emotions which was almost certain to dominate the affair. Although completely ignorant of her motive in writing to him, Selwyn invented a hundred different reasons—only to discard them all. Nor was Elise more able to satisfy herself as to the outcome of the meeting. It was not his actions that were difficult to forecast, but her own. Would her dislike of him be intensified? Would she experience again the momentary rapture of that summer afternoon?

It was fortunate that another lover had appeared for Marian, so that the desertion of Maynard did not leave her moping untidily about the place. She was one of those women who are so singularly lacking in self-sufficiency that, except when in the company of men, they are as flat as champagne from which the sparkle has departed.

It so happened, therefore, that Elise was again alone the following evening, dreading Selwyn's arrival, yet impatient of delay.

A few minutes after eight she heard him knock, and going to the street door, opened it for him. The night was a vapourish, miserable one, blurring his figure into indistinctness, and when he spoke his voice was hoarse, as though the damp tendrils of the mist had penetrated to his throat.

Answering something to his greeting, she led him through the hall into the sitting-room. He paused as he entered. Without looking back, she crossed to the fireplace, and kneeling down, stirred the fire.

'May I help?'

'No, thanks. I prefer to do it.'

Her answer had followed so swiftly on his question that he stopped in the act of stepping forward. She looked over her shoulder with a swift, searching glance.

His face was a tired gray, and the silk scarf thrown about his neck looked oddly vivid against the black evening-clothes and overcoat. But if his face suggested weariness, his eyes were alive with dynamic force. The intensity of the man's personality strangely moved Elise. She felt the presence of a mind and a body vibrating with tremendous purpose—a man who drew vitality from others, yet charged them in return with his own greater store.

To her he seemed to have divorced himself from type—he had lost even the usual characteristics of race. With the thought, she wondered how far his solitary life had effected the transition, if his idealism had brought him loneliness.

'Won't you sit down?' she said hesitatingly.

'Do you mind if I stand?' he replied.

She acquiesced, and took a seat in the chair from which Maynard had run the emotional gamut the previous evening. His desire to stand annoyed her. It was nothing, but at the very beginning it introduced an element of duelling.

'You look pale,' she said. 'I hope you have not been unwell.'

'No—no; it is merely that I have been so little out of doors. I could not gather from your note what kind of work you were engaged in. I see you are an ambulance-driver. I congratulate you.'

His voice conveyed nothing but polite interest in an obvious situation. With over-sensitive apprehension she listened for any suggestion of sarcasm that lay behind his words, but she could detect nothing beyond mere impersonal courtesy—that, and a far-off weariness, as of one who has passed the borders of fatigue.

'I wrote to your mother,' he said, 'when I heard of your elder brother's death. It must have been a great grief to you all.'

She did not answer him. His manner was so cold that he might have been deliberately disposing of a number of prepared comments rendered imperative by the laws of polite intercourse.

'Why didn't you let us know you had seen Dick?' she said abruptly.

'Then—you have heard?' He raised his eyebrows in surprise.

'Only last night, by the merest accident. He might have been killed in France, and we should never have known about it.' Her words were resentful and swift. 'Will you please tell me about him?'

Omitting the incident of Archibald's tavern, Selwyn told of the chance meeting with Dick, the encounter with Johnston Smyth, the night at the rooms in St James's Square, and the subsequent glimpse of them marching through Whitehall.

'Your brother asked me to say nothing,' he said calmly. 'That is one of the reasons why I did not let you know.'

'Had Dick changed at all?' she asked, trying to make her words as listless as his. 'I wish that you would tell me something that he said. You must know more about him than just'—

'I don't think he had changed,' said Selwyn; and for the first time his voice was tinged with compassion. 'He spoke of you with a kind of worship. I suppose you know how he idolises you.'

His dark eyes looked at her through partially closed eyelashes, but only the manner in which her fingers compressed the fold of her skirt betrayed the turmoil of her feelings.

'Is that all you can tell me?'

'That is all.' He made no attempt to elaborate the conversation or to introduce any new theme. The scene which had promised to be so dramatic was actually dragging with uncomfortable silences. She waited long enough for him to speak, but when he remained silent—it was a sardonic silence to her—she rose from the chair with the manner of one who has determined to bring an interview to a close.

'Thank you for coming so promptly,' she said. 'I am most grateful for your kindness to Dick—and I know enough of the law to realise that you were taking a risk in hiding him.'

'It was nothing at all,' he said. He looked at her for an indication that her questions were at an end.

'I hope you will be able to get a taxi,' she ventured helplessly.

For the first time he smiled, and she reddened with mortification. He had been so cool and unyielding, so bloodless, that he had forced her to a disadvantage. She knew he could not be ignorant of the strain of the affair on her, yet he had done nothing to ease it. If she could have

projected her mind into his, she would have seen that his conduct was as inexplicable to himself as to her. He knew he was hurting her. Perhaps it was because her warm lips and crimson cheeks were creating a torment in his soul that he could not curb the impulse to wound her. It may have been the subconscious knowledge that where one can hurt one can conquer that dominated his actions. While she resented the invulnerability with which he guarded his own feelings, it is probable that any different attitude on his part would have brought forth a more active unkindness on hers. When men and women love, strange paradoxes are found.

They went to the door together, and in the brighter light of the hall Elise saw for the first time that he was considerably thinner, and that his brow was like marble. She felt a little stab of pity for him, forgetting his own lack of sympathy towards herself; she caught a faint realisation of what he must have endured for it to have marked him so indelibly.

'Don't you think,' she said, 'that you ought to go to the seaside for a while? You are not looking at all well.'

His lips grew firmer, but there was a curious look in his eyes as he turned towards her. 'I have work to do here,' he said crisply.

'I know—but surely'—

'In London,' he said—and there was a suggestion of the fanatic's ecstasy in his voice—it is impossible to forget life. I don't want my mind soothed or lulled. You can always hear the challenge of the human destiny in London.' He had held his head erect, and had spoken louder than was his custom; but, checking himself, he made a queer, dramatic gesture with his hands.

The fire of his spirit swept over her. Once more she stood close to him, as she had done so many times in her thoughts. She did not know whether she loved or detested him. She was fascinated—trembling—longing for him to force her to surrender in his arms—knowing that she would hate him if he did. She gave a little cry as Selwyn, almost as if he read her conflicting thoughts, took her arms with his hands once more.

'If we had both been English,' he said, and his voice was so parched that it seemed to have been scorched by his spirit, 'or if we had met in other times than these, things might have been different. I know what you think of me for the work I am doing, but it would be as impossible for me to give it up as for you to think as I do. We come of two different worlds, you and I. . . . I am sorry we have met to-night. For me, at least, it has reopened old wounds. And it is all so useless.'

She made no reply; but as his eyes were lowered to her face, and he saw once more the trembling lips, her unsoiled womanliness, her whole vivid, lonely, gripping charm, a look of suffering crossed his face. He realised the

hopelessness of it all, but the admission was like tearing out a thread which had been woven into the whole scheme of his being.

'We both have our work to do,' he said wearily, letting his arms drop to his side. 'Good-night.'

She answered, but did not give him her hand. With a repetition of the farewell he left her, and she walked musingly into the room again. She felt a flush of anger at his daring to say their friendship was impossible, when she had not even suggested that it could ever be resumed. His vanity knew no bounds. . . . She was furious at having let him hold her as he did—even more furious with the knowledge that she would not have resisted if he had kissed her.

'And not once,' she murmured, with a little catch of her breath, 'did he call me "Elise."'

CHAPTER XVII.—MOONLIGHT.

I.

TWO summers came and went, and the little park in St James's Square rested once more beneath its covering of autumn leaves.

Selwyn, who was still occupying the rooms of the absent New Yorker, was looking over his morning mail. The thinning of his hair at the temples was more pronounced, and here and there was the warning of premature gray. He had lost flesh, but his face had steadied into a set grimness, and his mouth had the firmness of one who had fought a long uphill fight.

Looking through a heavy mail, he extracted a letter from his New York agent:

'Oct. 2nd, 1916.

'DEAR MR SELWYN,—You will be interested to know that the extraordinary sensation caused by your writings in America has resulted in the sale of them to Mr J. V. Schneider for foreign rights. They have been translated, and will shortly appear in the press of Spain, Norway, Holland, and the various states of South America.

'It would be impossible for me to forward more than a small percentage of the comments of our press on your work, but in my whole literary experience I don't remember any writer who has caused such a storm of comment on every appearance as you. As you can see by the selection I have made, the papers are by no means entirely favourable. I feel that you should know that you are openly accused of pro-Germanism, of being a conscientious objector, &c., &c.—all of which, of course, means excellent advertisement.

'I have had many inquiries as to whether you would care to conduct a lecture-tour. There is a Mr C. B. Benjamin, who is financially interested in Mr Schneider's affairs, and who is willing to pay you almost anything within reason, if you care to state your terms.

'Of course, the most discussed article of all is

"The Island of Darkness," in which you accuse Britain of contributing so largely towards bringing about the present war. The German-American organisations and the strong Irish section here were especially jubilant, and every one concedes that it has awakened a great deal of resentment against Britain that had been forgotten since the beginning of the war. Even your detractors admit that "The Island of Darkness" will live as a literary classic.

'Your first ten articles have been made into book form under the title *America's War*, and are selling most satisfactorily. The first edition has gone into 40,000 copies. The attached clipping from the *New York Express* is fairly typical of the reception given the book by the pro-Entente press.

'Your September statement will go forward to-morrow with cheque covering foreign rights, royalties, &c.—I am, Mr Selwyn, yours very truly,
S. T. LYONS.'

With hardly more than a merely casual interest, Selwyn glanced at the clipping attached to the letter. It was from the editorial page of the *Express*.

'THE MENACE OF SELWYN.

'In 1912 Austin Selwyn was known as a younger member of New York's writing fraternity. He had done one or two good things and several mediocre ones, but promised to reach the doubtful altitude of best-sellership without difficulty. To-day Selwyn is the mouthpiece of neutrality. He has preached it in a language that will not permit of indifference. He has succeeded in surrounding his doubtful idealism with a vigor that commands attention, even if not respect. Right in the heart of London he is turning out insidious propaganda which is being seized upon by every neutral American who has his own reasons for wanting us to keep out of war. It would be absurd to say that one man's writing could in itself sway a great nation, but nevertheless it is a vehicle which is being used to the limit by every pro-German agency in this free land.

'Truly we are a strange people. We have a President who deliberately cuts his political throat with a phrase, "Too proud to fight;" but because we think Wilson is a greater man than he himself knows, we sew up the cut and send him back for another term. In the same way, although every red-blooded American has in his heart been at war with Germany since the *Lusitania*, we permit this man Selwyn to go on cocaining the conscience of our people until our flag, which we have loved to honor, is beginning to be a thing of shame. He should be brought back from England and interned here with a few "neutral" German-Americans. He certainly can write, and perhaps from confinement he might give us a second *De Profundis*. His

book, *America's War*, which is now on the market, is a series of arguments showing that America is at war with the causes of the war. It is a nice conceit. Our advice is to add the book to your library—but don't read it for ten years. In that time it will be interesting to see the work of a brilliant mind prostituted (and in this we are placing the most charitable construction on Mr Selwyn's motives) by intellectual perversion.'

Without the expression of his face undergoing any change, Selwyn carefully placed the letter on his file, and took from the envelope a number of American press clippings. Choosing them at random, he contented himself with reading the headings:

'Author of "The Island of Darkness" again hits out.'

'"Britain has thrived on European medievalism," says Austin Selwyn.'

'More hot air from the super-Selwyn.'

'Selwyn is the spokesman for enlightened America.'

'Masterful thinker, masterful writer, is the author of "The Island of Darkness."'

'What does Selwyn receive from Germany?'

'The arch-hypocrite of American letters.'

With a shrug of his shoulders he threw them to one side. 'A pack of hounds,' he muttered, 'howling at the moon!'

He leaned back in his chair and pondered over the written word that could leap such spaces and carry his message into countries which he had never seen. It was with a deeper emotion than just the author's pleasure at recognition that he visualised his ancestor leaving Holland for the New World, and the strange trend of events which was resulting in the emigrant's descendant sending back to the Netherlands his call to higher and world citizenship.

Still ruminating over the power that had become his, he noticed a letter, on the envelope of which was written 'On Active Service,' and breaking the seal, found that it was from Douglas Watson, written at a British hospital in France. As Selwyn read it the impassiveness of his face gave way to a look of trouble. For the first time in many months there was the quick play of expression about his lips and his eyes that had always differentiated him from those about him.

At the conclusion of the letter he put it down, and crossing to the French windows, leaned against them, while his fingers drummed nervously on the glass. With a gesture of impatience, as though he resented its having been written at all, he picked up the letter once more, and turning the pages, quickly reached the part which had affected him so:

'They tell me I'm going to lose my arm, and that I'm out of it; but they're wrong. I'm going back to America just as soon as they will let me, and I'm going to tell them at home what

this war is about. And, what's more, I'm going to tell them what war is. It isn't great armies moving wonderfully forward "as if on parade," as some of these newspaper fellows tell you. It's a putrid, rotten business. After Loos dead men and horses rotted for days in the sun. War's not a thing of glory; it's rats and vermin and filth and murder. Three weeks ago I killed a German. He hadn't a chance to get his gun up before I stuck him with my bayonet like a pig. As he fell his helmet rolled off; he was about eighteen, with sort of golden hair, and light, light blue eyes. I've been through some hell, Austin, but when I saw his face I cried like a kid. To you that's another argument for our remaining neutral. To me that poor little Fritz is the very reason America should have been in it from the first. Can't you see that this Prussian outfit is not only murdering Frenchmen and Russians and Britishers, but is murdering her own men as well? If America had been in the war it would have been over now, and every day she holds back means so many more of the best men in the world dead.

'For the love of Mike, Austin, clear your brains. I have seen your stuff in American papers sent over to me, and it's vile rot. Tomorrow they're going to take my left arm from me, but'—

Selwyn crumpled the letter in his hand and hurled it into the fireplace. Plunging his hands into his pockets, he paced the room as he had done that night when Watson had called to tell him he was going to enlist. He was seized with an incoherent fury at it all—the inhumanity of it—the degradation of the whole thing. But through the formless cloud of his thoughts there gleamed the one incessant phrase 'about eighteen, with sort of golden hair, and light, light blue eyes.' Why should that groove his consciousness so deeply? He had heard, unmoved, of the death of Malcolm Durwent. A month ago he had read how Captain Fensome, of Lady Durwent's house-party, had been killed trying to rescue his servant in No Man's Land. The sight of Dick Durwent and Johnston Smyth marching away had been only a spur to more intensive writing. Then why should that haltingly worded sentence lie like ice against his heart?

A sharp pain shot through his head.

Stopping his walk, he leaned once more against the windows, and rested his hot face on the grateful coolness of the glass.

What, he questioned, had he accomplished, after all? He had gained the ears of millions, but the war was no nearer a close. America was neutral—that was true. *But why was America neutral?* Had he falsely idealised his own country? Was her aloofness from the world-war the result of a passionate, overwhelming realisation of her God-deputed destiny, as he had imagined?

Hitherto he had paid no attention to the writings in the English press chronicling the passing of the world's gold reserve from London to New York. He had ignored the evidence of nation-wide prosperity from the Atlantic coast to San Francisco. All such things he had dismissed as unavoidable, unsought material results of America's spiritual neutrality.

Yet, while the wheels of prosperity were turning at such a pitch, there was a boy lying dead—about eighteen.

He beat his fist into the palm of his hand. Who was this Schneider who had purchased foreign rights of his articles? What sort of a man was this Benjamin who wanted him to lecture? Were they, as he had supposed, men of vision who wished to co-operate in achieving the great unison of Right? . . . Or were they . . . ?

The thought was hideous. Was it possible that those writings, born of his mental torture, robbing him of every friend he valued—was it thinkable that they had been used for gross purposes?

His fingers again played rapidly against the windows as he wrestled with the sudden ugly suspicion. At last, utterly exhausted, he sank into a chair.

'There is only one thing I can do,' he said decisively: 'return to America at once. If, as I have thought, her neutrality is in tune with the highest; if my fellow-countrymen are imbued with such a spirit of infinite mercifulness that from them will flow the healing streams to cure the wounds of bleeding Europe, then I have carried a lamp whose light reflects the face of God. . . . But if . . .'

(Continued on page 371.)

SPEAKING AND SIGNALLING OVER LONG DISTANCES.

By 'SIGNALS.'

ONE of the most prominent characteristics of scientific development and discovery is the great benefit which sometimes follows from the application to commercial purposes of what at first appears to be an advance in purely academic knowledge.

A striking instance of this nature is furnished by the development in recent years of what is known as the Thermionic Valve, or the Audion. The applications of the principles underlying the audion are the subject of a steadily increasing number of patents, and the theory of its action in fulfilling the different purposes for which it is used is discussed in innumerable lectures and papers in the various scientific societies and journals.

The pioneers in the discovery of this invention were Professor J. A. Fleming and Dr Lee de Forest, and they and many other notable scientists have contributed to its development during the last twelve years.

In one of its simplest forms the thermionic valve has the appearance of an electric incandescent filament lamp of the ordinary size, with the addition of a 'grid' of fine wires of small mesh and a small cylindrical metal plate arranged concentrically around the filament. The filament, which is of tantalum, is similar to that used for a lamp, but is of smaller size and more compactly arranged. It is surrounded by the grid, which in turn is encased by the cylindrical plate, both grid and plate being of nickel.

Briefly stated, the action of the valve depends on the emission from an incandescent filament, glowing in a vacuum, of negatively charged electrons, and their power of producing a conducting medium for electric currents in the space between the grid and the plate. To increase the effect, the plate is maintained at a potential of

from thirty to forty volts by means of a battery of small dry cells.

The peculiarity of the valve under these conditions is that if the grid or mesh is now connected to an electric circuit on which minute oscillations or variations of potential are occurring, these variations will cause large increases and decreases in the current flowing from the battery between the filament and the plate.

The effect produced is a true magnification, without distortion, within certain limits, and in conjunction with a telephone very feeble currents, such as those produced by long-distance wireless signals or telephone speech, can be magnified to any desired effect, and thus give rise to audible sounds.

So far, the chief application for commercial purposes to which the thermionic valve or audion has been put is for the reception of wireless signals. Wireless waves which are too feeble to be observed by the detectors previously in use may be magnified as many times as required by the use of one or more of the valves, so that the oscillations may be easily recorded.

The facility with which faint signals may be detected and magnified by this means has enabled small reception aerials to be used which, by being carefully sited towards the sending-station and tuned to the frequency of the waves of electrical disturbance it is desired to 'pick up,' cut out all extraneous disturbances, permitting the required signals to be read without interference from other sources. This applies to both wireless telegraphy and telephony, and the distances over which wireless telephony is now practicable have been largely increased.

Another important application of this system of magnifying feeble currents is to be found in

the 'relaying' of telephone speech currents. The limit of distance over which it was possible to speak by the use of wires, without a prohibitive expenditure of copper in the conductors, appeared to have been reached before the introduction of the thermionic valve furnished a practical means of producing a telephone 'relay.'

With the employment of an audion as a 'relaying' instrument, there is now no reasonable limit to the distance over which speech can be transmitted by the use of wires of moderate gauge, and the possibility has been opened up of direct speech along an Atlantic cable suitably designed for this purpose.

The great development of wireless telephony and telegraphy for naval and military purposes, and particularly in the direction of communication with aeroplanes, has largely centred around this discovery. The simplicity and portability of the valve, and its suitability for both transmitting and receiving purposes, have opened up means of communication which were not contemplated at the commencement of the war; and it is gratifying to know that the Germans admitted in the published intelligence summaries of their General Staff that in the struggle for supremacy in the use and improvement of wireless telegraphy we held a lead which they were unable to overtake.

With the devotion of time and pains to the investigation of the possible applications of this discovery, further methods of employing it for the benefit of mankind will doubtless be revealed. One simple application suggests itself which does not appear to have been tried as yet. When a speaker is addressing a vast public meeting, the difficulty of making himself clearly heard throughout a large hall could be overcome by the use of the thermionic valve, which might be employed to amplify the sound of the voice,

and, if necessary, to reproduce it simultaneously at several points of the building; for the valve enables the vibrations produced by the human voice to be magnified without distortion, and without losing any of the characteristics of the original sound.

A small receiver in front of the speaker, and reproduction transmitters suitably placed in proximity to various portions of the audience, would enable the orator's words to be heard clearly beyond the limits to which an ordinary voice would penetrate. The strain on the speaker would by this means be very much reduced, and the effort of making the voice carry to the most remote portions of a large audience would be no greater than that involved in speaking to a small gathering. There would, of course, be no time interval between the sounds as spoken and as heard from the reproducing instrument, while the gestures accompanying the speech would synchronise with the sounds as reproduced.

Extensions of this principle would enable a speech or a declaration to be made to many audiences at one and the same time. By the use of the ordinary telephone system, as many halls as required could be connected to the place at which the speech was being delivered. At each of the connected halls the sounds as spoken into the receiver at the place where they originated would be suitably magnified and transmitted with no distortion, but with sufficient volume to be clearly heard.

Many other possibilities present themselves, such as its association with the 'electrophone' and the gramophone for reproducing loud records, and as the properties of the valve become more widely and precisely known, its adaptation for other commercial purposes may be confidently predicted.

MILLE BOMBES!

CHAPTER V.—AFTER FOUR YEARS.

FOUR years went by. Prosper had established himself in the Semois valley, and Mathilde, now in her twelfth year, had grown into a bonny girl. At school, and among the village folk, she had made a name by her silence and by a very uncommon memory. Everything seemed to be as a tale to her, she listened with such round-eyed alertness and pleasure. The curé, meeting Prosper one evening, spoke of these matters. 'As water passes into a sponge,' he said, 'so teaching, religious and other, passes into this girl's mind. If these natural gifts are not overstrained, they will grow and grow, and Mathilde will not be a peasant-woman, my good friend.'

Prosper carried these laurels with difficulty. He was eager to boast about Mathilde's good gifts, but the curé told him to guard his tongue, else the village mothers would not be on his side.

Two or three times a year there was a sketching visit from Crowley, and now and then Bertrand and Colin came. Then Prosper was in his glory, and listened open-mouthed to all the studio news. His friends had left the academy, and were trying, without much success, to pay for their painting materials by selling their pictures. 'Not to sell what you paint,' said Prosper, 'is like keeping a family. But I didn't think of this when I helped to make pictures.'

In the autumn of 1904, after a week's sketching, Crowley promised to return in the winter. 'You see, Prosper, I want to paint this country-side after a snowstorm. Will you write to me if you get a snowstorm that is really big!'

'Yes, m'sieu, of course; but I don't want any storm to be too big. This little house, you know,

is only two hundred metres from the Semois, and it isn't built with much good sense. It stands in a cup of ground, with a ridge behind it; so water would collect rapidly, wouldn't it? In winter, then, I keep my eye open for a flood.'

After Crowley's going there was much talk of snow between Prosper and Mathilde; or, rather, Prosper talked and the child listened eagerly, for she was very fond of Crowley.

'Maybe M'sieu Colin will come too, and bother the curé with his chaff about Renan and science, and other things,' said the ex-model. 'Just snow enough—not too much snow. Then you'll write the letter and I'll look on.'

A cold winter set in, with piercing winds and frequent severe frost; but no snow fell before Christmas. Soon afterwards it began to fall, with a steadiness very wonderful to see, producing enchanting effects on the wooded landscape. For about forty-eight hours a clustering white mantle gathered quickly on all things. Then a keen wind swept through the valley and piled the snow into drifts. The wind fell, snow came on again—and Mathilde wrote to Crowley. In three days an answer came. Crowley had a portrait to paint, but he would come down on Prosper's birthday, 16th January. Would Mathilde let him know if the snow went away?

The snow did not go away. No peasant, not the oldest in the neighbourhood, had ever seen such an alarming white winter. If a thaw came suddenly, not gradually, the Semois in a gathering spate would overleap its banks and become a noisy, ravaging inundation.

But human forethought is rarely, if ever, complete. Most persons like to turn from unpleasant facts to phrases that cheer; and it happened that neither Prosper nor his neighbours gave sufficient heed to the temperature, which was not yet cold enough for a long snow season.

The day before Crowley's arrival an exquisite morning shone with crystalline brilliance from a serenely ardent sky, a pale-blue infinity. The glowing white valley and its blue shadows throbbled with loveliness, as though the pulse-beat of Nature's heart had been braced by the cold bath of snow; and the air was like enchanted wine worth a guinea a glass. Peasants drew it with joy into their lungs and felt light with hopeful confidence. And then, about mid-day, a veering wind became milder and milder.

In the evening Prosper said to Mathilde, 'Fillette, will you be afraid if I leave you alone while I go to our village and seek help? Tomorrow we must move, carrying away as much as we can.'

'I've been afraid once, only once, and then you came,' Mathilde answered. 'And I cannot be all alone, as I've Lion, and also that funny, beautiful book of pictures by Caldecott that my friend M'sieu Crowley sent me. If I learn the English verses all by heart, M'sieu Crowley will be pleased. Oh, I like so much to please him!'

Lion was a large Flemish cart-dog, a Prosper of its breed. It is one of nature's laws that big organisms are usually tolerant, while the small and tiny are usually aggressive, like microbes and mosquitoes.

Prosper had two lanterns; he lit the larger one and went out into the thaw. Walking was difficult, as the pathway across the fields undulated, and the snow, somewhat more than two feet deep on the path itself, was a trap in hollows. But Prosper did not mind. He was cheered by the sky. Great clouds had collected again; only a star here and there could be seen. If snow falls again, Prosper thought, the thaw will end, and M'sieu Crowley will not be disappointed.

In the village he made arrangements with five good fellows who promised to be at the farm soon after daybreak. On his way home Prosper passed the *estaminet* and called good-night to Charles Janssens, the landlord, who had come to his door to see what the weather was going to do.

'More snow is coming,' said Janssens. 'Better have a glass before you go on! Eh? A little, sweet, warming glass?'

Prosper stopped. 'A glass?' he repeated. 'No. These three years I've not touched a drop. *Mille bombes!* What a thirst I used to have! It gnawed inside me. Well, it's gone!'

'So I don't get rich!' cried Janssens, whose gruff voice fawned. 'Still, you've done me more than one good turn, Prosper, and I'll do you one now. As an artist stays with you now and then, you ought to have a bottle of good stuff in your house.'

'True, there'll be no harm in that. Well?'

'A friend of mine in France has sent me some splendid absinthe. One little glass—one sweet little tickling glass of it—will delight M'sieu Crowley. I'll give you a bottle, then?'

'M'sieu Crowley never drinks absinthe,' said Prosper. 'He's what they call an athlete, and keeps himself trained.'

'But M'sieu Colin drinks many things,' the landlord answered. 'And M'sieu Bertrand too. I know! So a bottle you shall have!'

Janssens went indoors, but no sooner had he taken a bottle from a shelf behind his bar than he noticed another which was only about half-filled, and at once his face brightened. Why give away a full bottle when another could be diluted with water? He looked furtively towards the door; it was closed, and Prosper was outside. In a trice he added enough water, and put in the cork, but not to its full length.

In a happy mood, Janssens returned to Prosper and held the bottle temptingly near the lantern. 'See how good this drink looks!' he pleaded. 'And notice that the cork has been drawn! There's hospitality! It invites all the world to have a sip! Into your pocket it goes—there! Good-night!'

'Cabarets used to empty my pockets, Janssens ! Thanks, and good-night !'

Clouds had thickened, and, in spite of that eerie twilight which comes in the dark from snow, walking was increasingly troublesome. Wet to the knees and his feet painful with cold, Prosper plodded on. Presently the power of suggestion began to work in his mind, just as a story works in a writer's. He recalled word by word what Janssens had said about the absinthe, and soon he was fingering the bottle through his overcoat. 'It invites all the world to have a sip !' Prosper halted, hesitated, and then he walked more rapidly and without care ; missed the footsteps he had made on his way to the village, and blundered suddenly into a drift ; stumbled, and dropped his lantern. '*Imbécile !*' he cried aloud. The lantern was easy to recover, but it had gone out, and he had stupidly left his matches at home.

Prosper groped his way back till he recovered his old foot-tracks, but now and then he lost his bearings when passing through a wood. He grew colder, and soon the innkeeper's words returned. 'It invites all the world to have a sip !' It was like a melody in music, it ran so easily in Prosper's mind—so easily and so persuasively. What harm would be done if he took a sip ? At last, with a swift, hurried movement, he tugged the bottle from his pocket and fingered the cork ; and then, suddenly, he put the bottle to his mouth and gripped the cork with his teeth. At this moment there happened in his spiritual depths one of those impulses, seemingly freakish, which do more work in man's world than argument and reason. Prosper began to think of Crowley, his friend and patron, and not of Mathilde, who had altered and bettered his whole life !

'What would M'sieu Crowley say,' Prosper thought, 'if I let myself be beaten by this bottle ? Would he come to see me again ?'

These questions shot through his mind while his teeth gripped the cork. His teeth relaxed, but the bottle remained at his mouth. For the first time Prosper became fully conscious that his respect for Crowley was so deep that the loss of the Englishman's friendliness and esteem would make him self-ashamed and solitary.

'Ah, he'd give me up !' Prosper thought. 'He'd go away and tell Bertrand and Colin, and all would be over. Yes, and what would the *fillette* say ?'

On his arrival at this question he lowered his arms quickly. Mathilde would forgive and forget whatever he might do ; but although he believed so, yet thinking of Mathilde reinforced the self-discipline which his respect for Crowley had stirred into action. His mind, went on thinking till at last, and all of a sudden, another impulse came. Prosper took the bottle by the neck and hurled it away from him.

'*Mille bombes !*' he said aloud. The tone

implied that his inward struggle had been very keen and tiring. Prosper took off his cap, and with a rough movement of his hand wiped sweat from his brow. 'There's a fire in my head,' he thought ; and then with an irritable movement he stooped, and knelt, and thrust his head in the snow. The shock of cold caused him to shiver ; he rose quickly, and strode off, his mind still at work.

About half-way home he had to pass over a deepish ditch spanned by a plank. The crossing was easy ; it needed only a little care, all snow having been removed from the plank ; but, brooding and negligent, Prosper forgot the ditch, and though he reached the plank with one foot, he missed it with the other, threw out his arms to regain his balance, failed, and fell, crashing some five or six feet into a mixture of snow and water. A log of wood was lying in the ditch, and Prosper fell with his right knee upon it. Though badly shaken, he tried at once to rise, but pain in his knee was so intense that he failed again and again. At last he managed to struggle somehow to his feet, only to find that he could do no more.

In this plight Prosper's mind worked slowly. His first mood was one of bewilderment ; a gust of violent temper came next, in which he beat at the snow lying around him ; but this movement stirred his knee, and pain recalled the fact of his helplessness. A little later he began to call, '*A moi !*' His big, husky voice rang out into the night, and the sound of it cheered him. '*A moi ! A moi !*'

(Continued on page 379.)

HIS GRAVE.

His grave is far away
Across the sea,
Away from home and love—
Away from me.

I'd go and lay on it,
If it were near,
The spring-time flowers he loved
When he was here.

I'd plant the summer roses,
White and red,
Beside the wooden cross
Above his head.

Lord, I believe his soul
Is in Thy care,
Yet from my heart doth rise
This human prayer :

'Oh Lord, beside his grave
May flowers spring,
And in the air above
May sweet birds sing !

'Oh, may the spot be blessed
And brightness shine !
May Nature take the charge
That should be mine !'

SEVENTH SERIES

SOME COINCIDENCES OF THE GREAT WAR.

By Sir EDWARD PARROTT, M.A., LL.D.

A 'strange coincidence,' to use a phrase
By which such things are settled nowadays.
BYRON (*Don Juan*).

THE recognition of similarities of event or experience occurring at considerable distances of time never fails to interest and intrigue mankind. Most people are keen to notice such instances as happen in their own lives, and to comment on them, usually in terms of amazement. The majority of people do no more; but the few who are given to reflection find themselves impelled to inquire whether they perceive in these so-called coincidences evidences of design on the part of a mysterious agency that shapes and moulds their destiny, or whether they are simply confronted with examples of mathematical probability. At any rate, no striking coincidence goes without recognition, always assuming that it occurs spontaneously and is not due to deliberate stage management. In the realm of fiction 'the long arm of coincidence' is only too frequently the novelist's *deus ex machina*. When he invokes it to unravel an otherwise inextricable plot he is rightly condemned, for everybody recognises that such widely separated parities of circumstances as he employs are wholly exceptional in character, and can, therefore, play no essential part in a faithful representation of ordinary everyday life.

It is the purpose of this paper to point out a few of the 'coincidences' which occurred during the Great War. There is an old story to the effect that a Scot, when viewing the Niagara Falls, was asked by an American, 'Have you ever seen anything so remarkable or so curious?' The Scot made reply, 'As for remarkable, I'll no say; but as for curious, I once saw a pig wi' a wooden leg!' The coincidences of the Great War were both remarkable and curious, and the few instances given below can be multiplied many times by a diligent study of the records which are becoming more and more readily available every day.

No descriptive term has been more widely applied to the Great War than *Armageddon*, which indicates a struggle comparable to that described in the Book of Revelation, when 'the kings of the earth and of the whole world' gathered them to 'the battle of that great day of God Almighty.' The word *Armageddon* is simply the corrupted

form of the name of a district round the Canaanite fortress of Megiddo. It was to Canaan what Flanders was to Europe—a 'cockpit' in which nations fought out their quarrels. Strange to say, the decisive movement which marked the beginning of the end of the war occurred in the neighbourhood of Armageddon. By 8 P.M. on September 20, 1918, the Turkish resistance in Palestine had everywhere collapsed except on the Turkish left, in the Jordan valley. Our left wing had swung round to the east, and lay astride the railway and the roads running from the west to Shechem. On the north, after sundown, our mounted men left the low ground, penetrated the hills east of Mount Carmel, and rode over the field of Armageddon. It was this movement which hemmed in the Turkish left and led to its speedy and complete downfall. While negotiations for an armistice with the Turks were pending Bulgaria caved in. A little more than a month later Austria laid down her arms, and on November 11 of the same year Germany made her submission. Thus Armageddon was the scene of a movement which presaged the end of the struggle in all the theatres of war. Very appropriately Lord Allenby has recognised this remarkable fact by designating himself 'of Megiddo.'

The Marne valley is associated with a whole series of coincidences. The description 'Hun' as applied to the Germans is due to a maladroit speech by Ex-Kaiser Wilhelm in 1900, when he sent his troops to China, and sped them on their way with the following exhortation: 'Whoever falls into your hands is forfeit to you, just as a thousand years ago the Huns under King Attila made a name for themselves in tradition and story.' It is said that the Germans in China bettered their master's instruction, and that they did not leave so much as a dog alive on the blood-stained road to Peking. Everybody knows that Attila, whose deeds they were to emulate, was the most ruthless and brutal savage who ever held sway. He boasted that where his horse set its foot grass never grew again. He was the 'Scourge of God,' so monstrous in his cruelty that men trembled at the very mention of his name.

In the year 451 A.D., at the head of three-quarters of a million of his hideous followers,

he marched into Gaul, lighting his beacons in burning towns, and blazing his trail with ruined homesteads and wasted fields. Eager to reach the shores of the Channel, he advanced to Orleans; but Goth, Gaul, and Roman formed an *entente* to oppose him, and force him to retreat to Châlons on the Marne, where, on the surrounding plains, he suffered a terrible defeat, and with the remnant of his forces left the land, never to return. Thus, more than fourteen and a half centuries ago, France was saved from Hun domination in the valley of the Marne.

The historical parallel during the recent Great War is particularly noteworthy. It was at the Marne that the Allied line, knitted up anew after a long and costly retreat from the Belgian border, amazed the world by striking that mighty blow which forced the modern Huns to retire to the heights of the Aisne and there 'dig in.' That 'bolt to the burrows' marked the opening of the long trench siege which reduced the Germans to practical immobility for three and a half years, and gave the Allies that vital breathing-space during which they were enabled to develop an overwhelming strength of material, and apply the deadly grip of sea-power which ultimately destroyed the *moral* of the enemy.

In their last desperate effort to break through the trench fortress, the Marne was again the scene of Hun defeat. The Germans were across the river before the third week of July 1918, and had pushed the French from the hills that gave them observation along the waterway; but by the 21st of the month a correspondent could write: 'There is not a single German, or, rather, a single living German, on the south bank of the Marne. Under our victorious pressure they have had to recross the stream in disorder and panic.' This second repulse at the Marne was the signal for that mighty arpeggio of hammer-blows which resounded all along the line, and completely baffled and bewildered the enemy. Assuredly, in the story of the Hun, ancient and modern alike, the Marne is a name of dread. It spelt defeat for Attila, and hopeless ruin for the imperial monomaniac who, with all history to choose from, selected as his exemplar the most brutish and blood-thirsty tyrant known to man.

Another coincidence occurs in connection with that trench warfare to which I have referred. The whole region between Arras and the North Sea is full of memories of Marlborough's great campaigns during the opening years of the eighteenth century. The Lys, the Scheldt, Nieuport, Ostend, Lille, Tournai, Douai, Béthune, La Bassée, and Mons—names familiar as household words to us—were equally well known to our forefathers in the reign of Queen Anne. As I stood at the gate of Lille on October 18, 1918, within a few hours of its evacuation by the Germans, and watched the first British

troops arrive, I could not help recalling Marlborough's capture of the fortress in December 1708. In the spring of the following year he proposed to march on Paris, aiming at Arras as his initial objective. The French blocked the way by strongly entrenching themselves on a line stretching from Douai, through La Bassée, to Béthune. Marlborough soon discovered that these trenches were too strong to be carried by direct assault, and he turned aside to reduce Tournai, and later on to besiege Mons, and fight the 'murderous battle' of Malplaquet. In 1711, however, he carried out a series of movements which are said to be his tactical masterpiece, and by so doing overran the French trenches and destroyed what had been thought to be an impregnable barrier.

More than two hundred years later, during the Great War, we also found the trenches in the neighbourhood of La Bassée too strong for us, and despite persistent assaults we never carried them. They were held by the Germans right down to October 1918, and were evacuated only when the steady forward movements of Haig to the south, and the splendid dash of King Albert and Plumer to the north, had made the whole region between Armentières and the La Bassée Canal a *cul-de-sac*, the mouth of which was being drawn closer every day. The Germans clearly perceived that if they delayed their departure any longer a Sedan was in store for them. On October 2 they withdrew from the trench-line that had defied both Marlborough and our modern British generals, and immediately our men swept forward in pursuit. It is surely a remarkable coincidence that La Bassée was won in both cases by tactical movements elsewhere, and that when it fell in 1918 a direct descendant of Marlborough, Mr Winston Churchill, was Minister of Munitions.

Sunday as a day of battle recurred with startling frequency during the long struggle. The murder of the Archduke Franz Ferdinand, which gave Germany her pretext for the long-meditated embroilment of Europe, occurred on a June Sunday of 1914. The battle of Mons, the first engagement in which the British took part, was fought on an August Sunday of the same year. It was on a Sunday that the first battle of the Marne began, and on a Sunday that our gallant troops, in the course of thirteen hours, made good the passage of the Aisne. Sir Christopher Cradock's squadron was overwhelmed in unequal fight off Coronel on a Sunday; and on the same day of the week, some three months later, the *Blücher* was sent to the bottom in the Dogger Bank battle. The great landing at Gallipoli was made on a Sunday, and the day of rest also saw the beginning of the battle of Festubert. The New Zealanders won Chanak Bair, and came within a quarter of a mile of victory, on an August Sunday of 1915; and on a December Sunday of the same year our troops

bade a final farewell to Anzac, which they had immortalised by their undying valour. An examination of dates in the later years of the war will reveal further instances of important movements which began or fructified on the Sabbath-Day. What a picture of contrasts! What a theme for the moralist!—the calm and peace of British Sabbaths, and the roaring, flaming Sundays of bloody strife on Continental battlefields—the house of prayer at home and the death-grapple abroad.

One final coincidence. The first and the last contact of the British with the Germans were made in precisely the same district of Belgium.

Our Expeditionary Force on Sunday, August 23, 1914, first faced the foe between Binché and Condé, pivoting on the mining-town of Mons. On November 11, 1918, a few hours before 'the bugles sang truce,' the 3rd Canadian Division marched into Mons. General Maurice, in his *Last Four Months of the War*, tells us that several cavalry officers who fought in the initial battle rode into Mons on Armistice Day. The 2nd Battalion Royal Irish Regiment, which held the loop of the canal to the north-east of the town in 1914, formed part of the 63rd Division, which was actually entering the same loop when hostilities ceased.

THE PARTS MEN PLAY.

CHAPTER XVII.—*continued.*

II.

THAT night a glorious moonlight silvered the roof-tops of old London, touching its jumbled architecture with fantastic beauty.

Vagrant towers and angular church spires, uninspired statuary, and weary, smoke-darkened trees shed their garments of commonplaceness and shimmered like the mosques and turrets of an enchanted city.

It was one of those nights that are sent to remind us that Beauty still lives; a night to challenge our mad whirl of bargaining and barter, to urge us to raise our eyes from the grubbing crawling of avarice; a night to awaken old memories, and to stir the pent-up streams of poetry lying asleep in every breast.

It was a moonlight that descended on Old England's troubled heart as a benediction. Her rivers were glimmering paths winding about the country-side; her villages and her heavy-scented country lanes shared its caress with open meadows and murky cities. The sea, binding the little islands in its turbulent immensity, drew the night's beauty to its bosom, and the spray of foam rising from the surf was a shower of star-dust leaping towards the moon.

As a weary traveller drinks thirstily at a pool, Selwyn wandered about the streets trembling with emotion in the breathless ecstasy of the night. All day the conjured picture of the German boy, guilty of no crime save blind devotion to his Fatherland, had haunted him like the eyes of a murdered man. It had robbed him of the power of constructive thought, and stopped his writing with the decisiveness of a sword descending on his wrist; it had made the food on his table tasteless, and given him a dread of the solitude of his rooms.

With nerves that contracted at every untoward sound, he had gone out at dark, and gradually the peacefulness of the night had soothed and calmed him as the dew of dusk cools the earth

after the heat of a summer's day. The familiar strains of Beethoven's 'Moonlight Sonata' came to his mind, and as he walked he idly traced the different movements of the music in the moods of the evening's witchery.

His steps, like his thoughts, pursued a tangled course, and led him into the prosaic brick-and-mortar monotony of Bayswater, but the moon was lavish in her generosity, and strewed his path with glinting strands of light. He paused in a quiet square to get his bearings. There was the heavy smell of fallen leaves from the gardens on the other side of the railing.

His mind was still playing the slow minor theme of the sonata's opening movement.

Suddenly the air was shattered with the noise of warning guns. As if released by a single switch, a dozen searchlights sprang into the sky, crossing and blending in a swerving glare. There was the piercing warning of bugles and the heavy booming of maroons.

Dazed by the swiftness of it all, Selwyn leaned against the low iron fence. A Boy Scout whirled past on a bicycle, his bugle hoarse and discordant; an old woman went whimpering by, hatless, with a protesting child in her arms; an ambulance, clanging its gong, rounded the corner with reckless speed; a mightier searchlight than any of the rest swept the sky in great circles.

It seemed only a matter of seconds, though in reality much longer, when the American heard a faint crunching sound in the distance, followed by a deep, sullen thud. In rapid succession came three more, and the defence guns of London burst into action, changing the night into Bedlam.

Still motionless, he listened, awe-struck, to the din of the weird battle with an unseen foe, when the cough of exploding shells in the air grew appreciably louder. Raising a whirlwind of dust, a motor-car swerved dangerously into the square, and with a roar sped up the road,

carrying to their aerodrome three British airmen. As if driven by a gale, the battle of the clouds drew nearer and nearer, the whine and barking of the shells like a pack of dogs trying to repel some monster of the jungle.

There was a deafening crash.

Selwyn was thrown against the fence, and almost buried beneath a shower of bricks and earth. With the roar of a rushing waterfall in his ears, and blood streaming from a wound in his forehead, he sank to his knees and for a moment lost consciousness; but mastering his weakness, he staggered to his feet and looked wildly about. On the other side of the street, where there had been a house, there was a smoking chaos. A little crowd had appeared seemingly from the bowels of the earth, and a woman was shrieking horribly.

Selwyn wiped his forehead with his hand and gazed stupidly at the blood which covered it. The roar of the guns was louder than it had yet been, and from a few streets away came the crunch of another bomb, shaking the earth with the explosion which followed. Selwyn leaned impotently against a post, and a quivering uncanny laugh broke from his lips. It was all so grotesque, so absurd. *Human beings didn't do such things.* It was a joke—a mad jest. He held his sides and laughed with uncontrollable mirth.

Then his whole form became rigid in a moment. A man had shouted something. There had been a wail from the crowd. Was it true? Some one buried alive—a little girl?

With a blasphemous curse Selwyn staggered across the road, and roughly elbowing his way through the crowd, found a solitary policeman, hindered by willing undirected hands, digging in the wreckage as best he could, while a couple of women sobbed hysterically and wrung their hands.

Those who watched hardly knew what had happened, but they saw a hatless, bleeding figure appear, and, with the incision of snapping hawsers, question the policeman and the weeping women. They heard his quick commands to the men, and saw him jump into the centre of the debris. With the instantaneous recognition of leadership his helpers threw themselves to the work with a frenzy of determination. Lifting, digging, pulling with torn hands and arms that ached with strain, they struggled furiously towards the spot where it was known the girl was buried. They were like starving wolves tearing at the carcass of an animal. They yelled encouragement and fought through the chaos—and still the stranger whipped them into madness with his cries.

There in the smoke and the choking dust Austin Selwyn shook in the grip of the greatest emotion he had ever known. A girl was buried—a fraction of a minute might mean her life. With hot breath and pulses on fire, he led

his unknown men through the choking ruins to where one small, insignificant life was imprisoned.

An ambulance sounded its gong, and drew up by the crowd; the storm of the guns continued to rage, but no one thought of anything but the fight of those men for one little, unknown life.

At last. They had uncovered a great iron beam which had struck on a stone foundation and left a zone of safety beneath. Eager hands gripped it, dragging it aside, and there was hardly a sound as the stranger lowered himself into the chasm. A minute later he reappeared, and a shout broke from the on-lookers. He was carrying a little form in his arms.

But when they saw his face a hush fell on every one. She was dead.

Wild-eyed, with the ghastliness of his pallor showing through the coating of grime and blood, Austin Selwyn stood in the ruins of the house, and the brown tresses of the child fell over his arm.

Kind hands were stretched out to him, but he shook them off angrily. He was talking to the thing in his arms—muttering, crooning something.

Slowly he raised his face to the skies. In the glare of the searchlights a gleaming, silvery, oblong-shaped form was turning and twisting like an animal at bay. They heard him catch his breath; then their blood was frozen by a choking, heart-rending cry of agony and rage.

It was the cry of the crystal-gazer who has had his crystal dashed from his eyes, to find himself in the presence of murder.

The crowd remained mute, helpless and frightened at the spectacle, when they saw a young woman approach him, a woman dressed in the khaki uniform of an ambulance-driver.

'Austin,' they heard her say, 'please give me the little girl.'

With a stupid smile he handed the child to her, and she laid it on a stretcher. When it had been taken away, she took Selwyn's hand in hers and led him, unresisting, to the ambulance.

CHAPTER XVIII.—ELISE.

I.

EARLY next morning, in a large military ward of a London hospital, Austin Selwyn woke from a sleep that had been charged with black dreams, and tried to recall the events leading to his present whereabouts.

By slow, tortuous process he reconstructed the previous evening as far as the moment when he had heard the warning guns. After that the incidents grew dim, and faded into incoherency. He seemed to remember rushing somewhere in a motor-vehicle. He distinctly recalled seeing a policeman in Trafalgar Square. Yes, that was very clear—quite the

most vivid impression of the whole night, indeed. He would hang on to that policeman.

With the care of an Arctic explorer establishing his base before going farther into *terra incognita*, he attached the threads of his wandering mind to that limb of the law, and groped in all the directions of his memory's compass. But it was of no avail. Tired out with the futile efforts he had made, his bandaged head sank back in the pillows, and the vivid policeman in Trafalgar Square was reluctantly surrendered as a negligible means of solution.

When he next awoke it was to the sound of many voices. There were two that were very close—one on either side of him, in fact. Affecting sleep, Selwyn listened carefully.

'Wot's that you say, Jock?' said a Cockney voice to his left.

'I was obsairvin',' said the other, 'that Number Twenty-sax is occupied this mornin'.'

'Ow yus, so it is. I was 'op'ing as 'ow me pal the Duke of Mudturtle would buy the plice next to mine. But he don't look a bad cove, wot you can see under 'is farncy 'ead-dress.'

'I dinna think he can be o' the army. His skin's as pale as a lassie in love.'

'In the army, Jock? Don't hinsult 'im. 'E's one of the 'eroes of the 'ome front—hindispensibles, they calls 'em.'

'Weel, weel, now,' expostulated the Scot, 'dinna tak' ower muckle for granted. We canna a' gang tae the war, or wha wud bide at hame and mak the whusky?'

'By Gar!' said a third patient opposite, sitting up suddenly and speaking in the disjointed but strangely musical dialect of the French-Canadian, 'she is a wise feller, dis Scoachie.'

'Bonn swoir, Frenchy,' said the Cockney graciously. 'Ow alley you mantenongs?'

'Verra good, Tommee. How is de godam bow bells?'

'Well, the last toime I sees me old side-kick the Lord Mayor, 'e says as 'ow they was took by a Canadian for a soovenir.'

'Na,' said the Scotsman reprovingly, 'I'm thinkin' yon's exaggerated.'

'By Gar!' said the French-Canadian. 'See, the orderly come now with water for shav'. Back in de bush or on de long portage I shav' once, twice, perhaps tree time a month. Always before I meet my leetle girl I shav'. But when I say good-bye and go to war—by gollies! de army make me for do it every day. My officier, he say, "What for you no shav' dis morning?" "Sair," I say, "I no kees de Boche—I keel him." He say noding to dat excep', "Look at you. I shav' every day. Do you preten' I doan' fight?" "Well," I say, "if de cap feets you, smoke it." And for no reason he give me tree time extra for carry de godam ration.'

At this stage the arrival of wash-basins interrupted further anecdote and philosophy, and the entire ward became animated with soldiers per-

forming their ablutions, some sitting up in bed, others on the edge of their beds, and a few so weak that they could just turn painfully on their side and wait for other hands to help.

A burst of hearty greetings told Selwyn that some one must have entered the ward, and a few minutes later he felt the presence of a nurse beside him.

'Good-morning,' she said, gently touching him on the shoulder. 'How is your head feeling?'

He opened his eyes and looked into the face bending over his. 'I think it's all right,' he said weakly. 'But, nurse, won't you tell me how I got here?'

She dipped a cloth into a basin and bathed his hands and face.

'You were hit by a piece of shrapnel in last night's air-raid. I wasn't on duty when you came in, but the night-sister said you were quite delirious—though you seem ever so much better this morning, don't you? I'll take your temperature, and after you've had some breakfast I'll put a new dressing on your wound.'

She was just going to insert the thermometer between his lips, when he stopped her with his hand. 'Nurse,' he said, 'why was I brought here—among soldiers?'

'Because every hospital is filled to overflowing. The casualties are so heavy just now.' Her voice was still kind, but there was a look of resentment in her eyes at his question.

'Please don't misunderstand me,' said Selwyn wearily. 'It is only the feeling that I have no right here. This cot should be for a soldier, and I'm a civilian. I'm an American, and—and if you only knew'—

'Just a minute, now, until we get this temperature, and then you can teil me all about it.'

With his lips silenced, but his doubts by no means so, he watched her move down the ward in commencement of the countless duties of her day. She was a woman of thirty-three or thirty-four years, still young, and possessed of a womanliness that softened her whole appearance with a tranquil restfulness. But beneath her eyes and in the texture of the skin faint wrinkles were showing, thinly pencilled protests against overwork, that no treatment could ever eradicate. On the red collar of her uniform was a badge which told that she had gone to France with the first little army of regulars in 1914.

Noting her calloused hands and the too rapid approach of life's midsummer, Selwyn watched her, and wondered what recompense could be offered for those things. In ordinary life, given the privileges and the opportunities which she deserved, she would have been another of those glorious English women whose beauty is nearest the rose. She would have been a wife to grace any home, and as a mother her charm would have been twofold. But for more than two

years incessant toil and endless suffering had been the companions of her days, and the not over-strong body was giving to the ordeal.

But as his heavy thoughts drifted slowly through this channel, he saw grinning patients who were well enough get out of bed to help her. As if she carried some magic gem of happiness, her soft voice and deft touch brought smiles to eyes that had been scorched in the flames of hell. Men looked up, and seeing her, believed once more in life; and hope crept into their hearts. Men in the great shadowy valley murmured like a child in its sleep when a ray of morning sunshine, stealing through the curtains, plays upon its face.

And of the many things which Selwyn learned that day, one was that those ministering angels, those women of limitless spirit and depthless sympathy, have memories of mute, unspoken gratitude, beside which the proudest triumphs of the greatest beauties are but the tawdry, tinsel glory of a pantomime queen.

II.

After the nurse had taken the thermometer from Selwyn and marked his temperature on a chart which she placed beside him, breakfast was brought in, and he was propped up with pillows.

'Guid-mornin',' said the Highlander. 'I hope ye're nane the waur o' your expeerience.'

'Not 'im,' broke in the Cockney, eating his porridge with great relish. 'It done 'im good.'

'I am very well,' said Selwyn haltingly. 'I hope my arrival did not disturb any of you last night.'

At the sound of his carefully nuanced Bostonian accent there was a violent dumb-play of smoothing the hair and arranging the coats of pyjamas, while one Tommy placed a penny in his eye in lieu of a monocle.

'I was 'oping,' said the Cockney with a solemn wink to the gathering, 'as 'ow Number 26 would be took by a toff, and, blime, if it ain't! It were gettin' blinkin' lonesome for me with only Jock 'ere and Frenchy opposite, who ain't bad blokes in their wy, but orful crude for my likin'.'

'Where did it hit ye?' asked the Scot encouragingly.

'On the head,' said Selwyn, pointing to his bandage.

'Mon, mon, that's apt to be dangerous.'

'Nah then!' cried the Cockney, reaching for his temperature-chart, 'we'll open the mornink proper with the 'Ymn of 'Ate. In cise you don't know the piece, m'lud, you can read it off your temperacher-ticket. Steady now—everybody got a full breath? Gow!'

With great zest all the patients who were able to sit up broke into a discordant jumble of scales as they followed the course of their tem-

peratures up and down the chart. Gradually, one by one, they fell out and resumed their breakfast, until the Scotsman was the only one singing.

'Ye ken,' he said, pausing temporarily and looking at Selwyn, 'yon should be rendered wi' proper deegnity.' With which explanatory comment he finished the last six notes, and solemnly replaced the chart on the ledge behind him, as if it were a copy of Handel's *Messiah*.

The last note had hardly died away when a violent controversy broke out between a pair of Australian soldiers on one side and almost the entire ward on the other. The thing had started by one of the Anzacs venturing the modest opinion that if Britain had had a million Australian troops, they, the present gathering, would be 'hoch, hoching' in Berlin (apparently a delightful prospect) instead of being cooped up in a London hospital.

The little Cockney was just going to utter a crushing sarcasm, the French-Canadian had taken in a perfectly stupendous breath, the Highlander was calmly tasting the flavour of his own reply, when the impending torrent was broken by the entrance of the chaplain, who wished every one a somewhat sanctimonious 'Good-day.'

'I shall read,' he said, putting on a pair of glasses, 'the latest *communiqué* from the front. We have done very well. The news is quite good—quite good. "*This morning, on a front of three miles, after an intense artillery preparation, the Australians*"'—

'OORAY!' roared the Cockney.

The glasses popped off the chaplain's startled nose, and he just managed by a brilliant bit of juggling to rescue them before they reached the floor.

'I—I,' he ventured, smiling blandly, 'am delighted at your enthusiasm, but you did not let me finish. "*This morning*"—um, um, ah—"*three miles*"—um, um, yes—"*three miles, after an intense artillery preparation, the Australians*"'—

'OORAY!' It was a deafening roar from the whole crowd.

"*The Australians*"'—

'OORAY!'

"*The*"'—

'Oo'—

'Really, men, you must control yourselves. We are all glad and sustained by any victory, however slight, but you must not give way to unmeaning boisterousness. "*This morning, on a front of three miles, after an intense artillery preparation, the Australians*"'—

There was a medley of submerged, prolonged snores. The chaplain looked up indignantly. With the exception of Selwyn and the two Australians, every one had followed the lead of the Cockney and disappeared underneath the bed-clothes.

'This,' said the good man—'this frivolity at such a harrowing moment in our country's destiny is neither seemly nor respectful. Cheerfulness is admirable, until it descends to horse-play.'

With which parting salvo the worthy chaplain, who had never been to France, and who was doing the best he could according to his clerical upbringing, left his unruly flock, taking the *communiqué* with him.

A little later the doctor made his rounds, pronouncing Selwyn's wound as not dangerous, but assuring him he was lucky to be alive. Another inch either way and—— Passing on to the Scotsman, he stayed a considerable length of time; but as the screen was set for the examination, the American had no way of knowing its nature.

And so, with constant badinage, seldom brilliant, but never unkind, the morning wore on. It was nearly noon when Selwyn saw a wheeled

stretcher brought into the ward and the Highlander lifted on to it.

'Jock,' said the little Cockney, 'I 'opes as 'ow everythink will come out orlright.'

'By Gar, Scoachie!' cried the French-Canadian, 'I am sorree. You are one dam fine feller, Scoachie.'

'Dinna worry yersel's,' said the man from the North. 'I'm rare an' lucky that it's to be ma richt leg and no the left, for that richt shank o' mine was aye a wee thing crookit at the knee, and didna dae credit tae the aichitecture o' tither ane.'

Thus, amid the rough encouragement of his fellows, and by no means unconscious of the dignity of his position, the Highland soldier was taken away to the operating-room.

The French-Canadian made a remark to Selwyn, but it was not until the second repetition that he heard him.

LEAVES FROM A CATALOGUER'S WALLET.

IV.—THE RIVAL ROMNEYS.

By W. ROBERTS.

I.

IN the summer of 1792 the eldest son of a distinguished commoner who owned great estates in the Midlands, and who had more than once refused a title, brought to Mr Romney's studio in Cavendish Square, London, a very beautiful young Italian, Paolina Giacometti-Langdon, for whom was claimed, in a manner not quite clear, kinship with the noble Italian family of Giacometti. The girl had had the misfortune to be born of poor parents in a working-class quarter of Venice; but money had been found to give her a good education as such went in Venice in the latter part of the eighteenth century. She developed not only great personal beauty, but a marvellously rich contralto voice, and a genius for acting, excelling equally in tragedy and in comedy.

After a course of training at Rome and Vienna, it was decided that Paolina should make her first public appearance on the stage at Venice in April 1792. It is not necessary to go into details as to the success of her début, for some of the letters of the many English visitors who 'assisted' at this great sensation have been printed and published. All testify to the beauty and to the superb acting of the young Venetian. The English declared that she outshone Mrs Siddons, Mrs Jordan, and all the other leading favourites of the British stage, and that there was no one on the Continent with such splendid qualities of voice and action.

For several nights in succession the theatre was crowded, and each performance revealed new and unexpected talents in the young *diva*. But on the seventh or eighth night Paolina created a fresh and entirely unexpected sensation; she disappeared, and for some weeks afterwards no trace of her could be found. Then it became known that Mr Algernon Langdon, visiting Venice on the Grand Tour with his tutor, had fallen violently in love with the beautiful Paolina, had induced her to elope with him, and that they were married in Paris *en route* for England. The marriage proved to be a very happy one, the bride receiving a cordial welcome from her young husband's parents. The sensation of the appearance of a star of the first magnitude on the stage in Venice, and the story of the run-away marriage, were still the talk of the West-End clubs and coffee-houses when Mr Langdon and his father brought the bride to Mr Romney's studio to pose for a whole-length portrait, for which the artist was to receive eighty guineas.

Romney was somewhat arbitrary in the matter of the dress worn by his lady patrons. He insisted where he could on a simple white gown and a hatless head; his subject thus attired, he could paint a faultless portrait in eight or ten sittings. Paolina was not only beautiful, she was self-willed, and refused to pose in a white dress. And so, put to the test, Romney excelled himself by painting her in a brilliant black-silk gown of which the sheen glints to-day as it did over a century

ago. When finished, the portrait was sent, at the artist's suggestion, to his frame-maker, William Saunders, who placed it in one of his simple but effective frames for the modest sum of five pounds seven shillings and sixpence, which included the case in which it was sent to the Langdons' ancestral home in the Midlands. Here it was accorded a place of honour in the dining-room with other portraits of various generations of the family. And here it remained, entirely unknown to the public, but admired by all visitors, and, like the other family portraits, was entailed on each successive owner or tenant for life.

II.

A few years ago an exhibition was held in New York of pictures by the early British school of artists. The exhibition was in aid of a deserving charity, and those who got it up were determined that nothing but portraits of the finest quality should be hung. Among the collectors who offered a selection from their walls was Mr Cyrus P. White, a Bostonian who had hitherto never lent any of his pictures to a public exhibition, who was almost entirely unknown as a collector, and who had bought his pictures without any kind of publicity many years before on his annual visits to Europe. He was a man of great reserve, and of unerring instinct in art matters.

Two members of the New York committee visited several Boston collections, and made their selections; but it was Mr White's superb whole-length Romney portrait of Paolina Giacometti-Langdon which overwhelmed them, and which they were convinced would be the great attraction of the exhibition. In this their expectation was more than fully justified. The exhibition was a triumphant success from the private-view day, but the success was almost entirely due to the Romney portrait of the beautiful young Italian woman. The newspapers were full of praise of its majestic beauty, its perfectly human loveliness. It was felt that if Romney had achieved fame by painting Lady Hamilton, he had attained immortality when he finished his picture of Paolina. Reproductions appeared in all the newspapers and periodicals; the romantic story was told of Paolina's début at Venice, of the run-away marriage, and of the strangest of all facts, that the marriage was a singularly happy one. Mr White himself had had the brief outlines of the story when he bought the picture, and was amused at the many fresh and surprising details which the vivid imaginations of the New York and other journalists had attached to the tale as he told it.

Reports of the exhibition, with its superb Romney, filtered through to some of the London morning newspapers, and penetrated to the country home of the Langdons. At first the head of the

family, Mr Montague Langdon, was amused, and then he was angry. How could the portrait of his great-grandmother, which still looked at him from the wall of his dining-room, be in New York, when it had, so far as he knew, never been out of the house since it was hung there in 1792? Clearly there was some mistake; but he fully realised that, unless the error was exposed and explained, the authenticity, and consequently the commercial value, of his portrait would be in jeopardy. With the aid and under the advice of the family lawyer, a statement was drawn up and sent to the leading New York papers, stating that the whole-length portrait of Mr Montague Langdon's great-grandmother by Romney had never been out of the possession of the family, that it was still in its original frame, and that it had hung in its present position ever since it was painted. Therefore the rival picture in New York must be either a copy (done many years ago, and hitherto unknown) or a 'fake.'

This statement duly appeared in the New York papers, and gave a piquancy to the interest aroused by the exhibition of the picture. It was excellent 'copy,' and the New York journalists were not slow in making the most of it. Mr Cyrus P. White was interviewed, but beyond an enigmatic smile, he contented himself with the declaration that *his* was the original, and the one in England the copy.

Obviously the matter could not rest here, for both portraits could not be original, and there was no record of Romney ever having painted a replica, as there is no entry of such in his diaries, which he kept with unusual fullness, and which are still in existence. Moreover, Mr Langdon had unearthed in the family archives his great-grandfather's cash-book, in which he had entered under date July 5, 1792, 'Pd. Mr Romney for Paolina's pt. 80 gs. ;' and there was a further entry of five pounds seven shillings and sixpence paid to Saunders for the frame. And so it would seem that the weight of evidence was distinctly in his favour. Various letters, at first polite, then a trifle charged with electricity, and finally unrestrained in language, passed between Mr Langdon and Mr White.

III.

At this point some one suggested that a minute examination of the canvases of both pictures might reveal some evidence worth having. And here we may claim to exercise the Shandean privilege of flying off at a tangent. A duty on canvas was first imposed by 10 Anne cap. 10, the 69th clause of which imposes upon all linens and stuffs (with certain exceptions) to be printed, stained, *painted*, or dyed a duty of three-halfpence for every yard in length; whilst the 97th clause directs the Commissioners on or before July 20, 1712, to provide proper seals or stamps for marking such

stuffs. The Act appears to have been more or less evaded; and one of 24 George III. (October 21, 1784) repeated the order as to the seals or stamps. These Acts remained in force until well into the nineteenth century, when they were repealed. The marks stamped on the backs of the old canvases are somewhat enigmatic and arbitrary, and most of them are probably now incomprehensible; but they constitute very important evidence in the case of English pictures painted in the eighteenth and early nineteenth centuries. As an illustration, a portrait by Romney, Reynolds, or Gainsborough could not possibly appear on a canvas with the year mark of 1830. A 'perfectly genuine' Titian was once found to have been painted over a portrait of Napoleon I., but even in art miracles do not occur every day!

The canvas of Mr Langdon's version of the Romney portrait of Paolina was examined, and on the back was found the following inscription:

TB	8	46	3
----	---	----	---
